PLANET makes no commitment to update or keep current the information in this User's Manual, and reserves the right to make improvements to this User's Manual and/or to the products described in this User's Manual, at any time without notice.

If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

## FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at whose own expense.

## CE Mark Warning

This device is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

## WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

## Energy Saving Note of the Device

This power required device does not support Standby mode operation.

For energy saving, please remove the power cable to disconnect the device from the power circuit.

Without removing power cable, the device will still consuming power from the power source. In the view of Saving the Energy and reduce the unnecessary power consuming, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

## Revision

User's Manual of PLANET Layer 3 24-/48-Port 10G SFP+ plus 4-Port 100G QSFP28 Managed Switch

Models: XGS-6350-24X4C, XGS-6350-48X2Q4C

Revision: 1.0

Part No: EM-XGS-6350 Series Configuration Guide\_v1.0

# Contents

<b>CHAPTER 1 INTRODUCTION .....</b>	<b>30</b>
<b>1.1 PACKET CONTENTS .....</b>	<b>30</b>
<b>1.2 PRODUCT DESCRIPTION .....</b>	<b>31</b>
<b>1.3 PRODUCT FEATURES .....</b>	<b>34</b>
<b>1.4 PRODUCT SPECIFICATIONS.....</b>	<b>37</b>
<b>CHAPTER 2 INSTALLATION.....</b>	<b>43</b>
<b>2.1 HARDWARE DESCRIPTION .....</b>	<b>43</b>
2.1.1 Switch Front Panel .....	43
2.1.2 LED Indications .....	44
<b>2.2 SWITCH INSTALLATION .....</b>	<b>47</b>
2.2.1 Desktop Installation.....	47
2.2.2 Rack Mounting .....	48
<b>CHAPTER 3 CONFIGURATION PREPARATION .....</b>	<b>50</b>
<b>3.1 PORT NUMBER OF THE SWITCH .....</b>	<b>50</b>
<b>3.2 PREPARATION BEFORE SWITCH STARTUP.....</b>	<b>50</b>
<b>3.3 ACQUIRING HELP.....</b>	<b>50</b>
<b>3.4 COMMAND MODES.....</b>	<b>51</b>
<b>3.5 CANCELING A COMMAND.....</b>	<b>52</b>
<b>3.6 SAVING CONFIGURATION .....</b>	<b>52</b>
<b>CHAPTER 4 SYSTEM MANAGEMENT CONFIGURATION.....</b>	<b>53</b>
<b>4.1 FILE MANAGEMENT CONFIGURATION .....</b>	<b>53</b>
4.1.1 Managing the file system .....	53
4.1.2 Commands for the file system .....	53
4.1.3 Starting up from a file manually .....	53
4.1.4 Updating software .....	55
4.1.5 Updating configuration .....	58
4.1.6 Using ftp to perform the update of software and configuration.....	59
<b>4.2 BASIC SYSTEM MANAGEMENT CONFIGURATION .....</b>	<b>61</b>
4.2.1 Configuring Ethernet IP Address.....	61
4.2.2 Setting the Default Route .....	63
4.2.3 Using Ping to Test Network Connection State .....	65
<b>CHAPTER 5 TERMINAL CONFIGURATION .....</b>	<b>68</b>
<b>5.1 VTY CONFIGURATION OVERVIEW .....</b>	<b>68</b>

<b>5.2 CONFIGURATION TASKS .....</b>	<b>68</b>
5.2.1 Relationship between Line and Interface.....	68
<b>5.3 MONITOR AND MAINTENANCE .....</b>	<b>69</b>
<b>5.4 BROWSING LOGS.....</b>	<b>69</b>
<b>5.5 VTY CONFIGURATION EXAMPLE .....</b>	<b>69</b>
<b>CHAPTER 6 SSH CONFIGURATION COMMANDS.....</b>	<b>70</b>
<b>6.1 SSH OVERVIEW .....</b>	<b>70</b>
6.1.1 SSH Server .....	70
6.1.2 SSH Client.....	70
6.1.3 Attribute Realization .....	70
<b>6.2 CONFIGURATION TASKS .....</b>	<b>70</b>
6.2.1 Configuring the Authentication Method List .....	70
6.2.2 Configuring Access List.....	70
6.2.3 Configuring the Authentication Timeout Time .....	70
6.2.4 Configuring the Authentication Retry Times.....	71
6.2.5 Configuring the Login Silence Period.....	71
6.2.6 Enabling Encryption Key Saving Function.....	71
6.2.7 Enabling SFTP Function .....	71
6.2.8 Enabling SSH Server .....	72
<b>6.3 CONFIGURATION EXAMPLE OF SSH SERVER.....</b>	<b>72</b>
6.3.1 ACL.....	72
6.3.2 Global Configuration .....	72
<b>CHAPTER 7 NETWORK MANAGEMENT CONFIGURATION .....</b>	<b>73</b>
<b>7.1 SNMP CONFIGURATION .....</b>	<b>73</b>
7.1.1 Overview .....	73
<b>7.2 SNMP TASKS .....</b>	<b>74</b>
<b>7.3 LLC2 CONFIGURATION TAST .....</b>	<b>74</b>
7.3.1 Configuring Idle Time Value .....	74
7.3.2 Configuring the Time Value of Waiting for Acknowledgement .....	75
7.3.3 Configuring Busy Time Value of Remote Terminal.....	75
7.3.4 Configuring Time Value of Response.....	75
7.3.5 Configuring the Time of Rejection.....	76
7.3.6 Configuring the Redial Times .....	76
7.3.7 Configuring the Size Of Window for Resending .....	77
7.3.8 Configuring the Size of Accumulated Data Packet .....	77
7.3.9 Setting the Acknowledgement Time-Delay .....	77
7.3.10 Setting the Maximum Numbers of Acknowledgement .....	78
7.3.11 Showing LLC2 Link Information .....	78
7.3.12 Debugging LLC2 Link Information .....	78
<b>7.4 EXAMPLE OF LLC2 CONFIGURATION .....</b>	<b>79</b>

7.4.1 Configuring SDLC as Two-Way and Concurrent Mode .....	79
7.4.2 Configuring SDLC Timer and Re-Sending Times .....	79
7.4.3 Configuring the Number of SDLC Frame and Information Frame .....	80
7.4.4 Controlling the Size of Cache .....	80
7.4.5 Controlling the polling of slave station .....	80
7.4.6 Configuring SDLC Interface as Half-Duplex Mode .....	81
7.4.7 Configuring XID Value.....	81
7.4.8 Configuring the Maximum Value of SDLC Information Frame .....	81
7.4.9 Monitoring SDLC Workstation.....	82
<b>CHAPTER 8 AAA CONFIGURATION .....</b>	<b>83</b>
<b>8.1 AAA OVERVIEW .....</b>	<b>83</b>
8.1.1 AAA Security Service .....	83
8.1.2 Benefits of Using AAA.....	83
8.1.3 AAA Principles.....	84
8.1.4 AAA Method List.....	84
8.1.5 AAA Configuration Process.....	85
<b>8.2 AUTHENTICATION CONFIGURATION .....</b>	<b>85</b>
8.2.1 AAA Authentication Configuration Task List .....	85
8.2.2 AAA Authentication Configuration Task.....	86
8.2.3 AAA Authentication Configuration Example .....	96
<b>8.3 AUTHORIZATION CONFIGURATION .....</b>	<b>97</b>
8.3.1 AAA Authorization Configuration Task List .....	97
8.3.2 AAA Authorization Configuration Task.....	97
8.3.3 AAA Authorization Examples.....	99
<b>8.4 AAA ACCOUNTING CONFIGURATION .....</b>	<b>100</b>
8.4.1 AAA Accounting Configuration Task List .....	100
8.4.2 AAA Accounting Configuration Task.....	100
<b>8.5 LOCAL ACCOUNT POLICY CONFIGURATION .....</b>	<b>105</b>
8.5.1 Local Account Policy Configuration Task List.....	105
8.5.2 Local Account Policy Configuration Task .....	105
8.5.3 Local Account Policy Example .....	108
<b>CHAPTER 9 CONFIGURING RADIUS .....</b>	<b>110</b>
<b>9.1 OVERVIEW.....</b>	<b>110</b>
9.1.1 RADIUS Overview.....	110
9.1.2 RADIUS Operation.....	111
<b>9.2 RADIUS CONFIGURATION STEPS.....</b>	<b>111</b>
<b>9.3 RADIUS CONFIGURATION TASK LIST.....</b>	<b>111</b>
<b>9.4 RADIUS CONFIGURATION TASK .....</b>	<b>111</b>
9.4.1 Configuring Switch to RADIUS Server Communication.....	111
9.4.2 Configuring Switch to Use Vendor-Specific RADIUS Attributes.....	112

9.4.3 Specifying RADIUS Authentication .....	112
9.4.4 Specifying RADIUS Authorization .....	113
9.4.5 Specifying RADIUS Accounting .....	113
<b>9.5 RADIUS CONFIGURATION EXAMPLES .....</b>	<b>113</b>
9.5.1 RADIUS Authentication Example .....	113
9.5.2 RADIUS Application in AAA .....	113
<b>CHAPTER 10 TACACS+ CONFIGURATION .....</b>	<b>114</b>
<b>10.1 TACACS+ OVERVIEW .....</b>	<b>114</b>
10.1.1 The Operation of TACACS+ Protocol .....	114
<b>10.2 TACACS+ CONFIGURATION PROCESS .....</b>	<b>116</b>
<b>10.3 TACACS+ CONFIGURATION TASK LIST .....</b>	<b>116</b>
<b>10.4 TACACS+ CONFIGURATION TASK .....</b>	<b>116</b>
10.4.1 Assigning TACACS+ Server .....	116
10.4.2 Setting up TACACS+ Encrypted Secret Key .....	117
10.4.3 Assigning to Use TACACS+ for Authentication .....	117
10.4.4 Assigning to Use TACACS+ for Authorization .....	117
10.4.5 Assigning to Use TACACS+ for Accounting .....	117
<b>10.5 TACACS+ CONFIGURATION EXAMPLE .....</b>	<b>118</b>
10.5.1 TACACS+ Authentication Examples .....	118
10.5.2 TACACS+ Authorization Examples .....	118
10.5.3 TACACS+ Accounting Examples .....	119
<b>CHAPTER 11 HTTP SWITCH CONFIGURATION .....</b>	<b>120</b>
<b>11.1 HTTP CONFIGURATION .....</b>	<b>120</b>
11.1.1 Choosing the Prompt Language .....	120
11.1.2 Setting the HTTP Port .....	120
11.1.3 Enabling the HTTP Service .....	120
11.1.4 Setting the HTTP Access Mode .....	120
11.1.5 Setting the Maximum Number of VLAN Entries on Web Page .....	121
11.1.6 Setting the Maximum Number of Multicast Entries Displayed on a Web Page .....	121
<b>11.2 HTTPS CONFIGURATION .....</b>	<b>121</b>
11.2.1 Setting the HTTP Access Mode .....	121
11.2.2 It is used to set the HTTPS port. ....	121
<b>CHAPTER 12 CONFIGURATION PREPARATION .....</b>	<b>122</b>
<b>12.1 ACCESSING THE SWITCH THROUGH HTTP .....</b>	<b>122</b>
12.1.1 Initially Accessing the Switch .....	122
12.1.2 Upgrading to the Web-Supported Version .....	122
<b>12.2 ACCESSING A SWITCH THROUGH SECURE LINKS .....</b>	<b>123</b>
<b>12.3 INTRODUCTION OF WEB INTERFACE .....</b>	<b>123</b>
12.3.1 Top Control Bar .....	124

12.3.2 Navigation Bar.....	125
12.3.3 Configuration Area .....	125
12.3.4 Bottom Control Bar.....	126
12.3.5 Configuration Area .....	126
<b>CHAPTER 13 BASIC CONFIGURATION .....</b>	<b>127</b>
<b>13.1 HOSTNAME CONFIGURATION .....</b>	<b>127</b>
<b>13.2 TIME MANAGEMENT .....</b>	<b>127</b>
<b>CHAPTER 14 CONFIGURATION OF THE PHYSICAL INTERFACE .....</b>	<b>129</b>
<b>14.1 CONFIGURING PORT DESCRIPTION .....</b>	<b>129</b>
<b>14.2 CONFIGURING THE ATTRIBUTES OF THE PORT.....</b>	<b>129</b>
<b>14.3 RATE CONTROL.....</b>	<b>130</b>
<b>14.4 PORT MIRRORING.....</b>	<b>130</b>
<b>14.5 LOOPBACK DETECTION.....</b>	<b>131</b>
<b>14.6 PORT SECURITY .....</b>	<b>131</b>
14.6.1 IP Binding Configuration .....	131
14.6.2 MAC Binding Configuration.....	131
14.6.3 Setting the Static MAC Filtration Mode.....	132
14.6.4 Static MAC Filtration Entries .....	132
14.6.5 Setting the Dynamic MAC Filtration Mode .....	132
<b>14.7 STORM CONTROL.....</b>	<b>133</b>
14.7.1 Broadcast Storm Control.....	133
14.7.2 Multicast Storm Control.....	133
14.7.3 Unknown Unicast Storm Control.....	134
<b>14.8 PORT PROTECT GROUP CONFIGURATION.....</b>	<b>134</b>
14.8.1 Port Protect Group List.....	134
14.8.2 Port Protect Group Interface Configuration.....	135
<b>CHAPTER 15 LAYER-2 CONFIGURATION.....</b>	<b>136</b>
<b>15.1 VLAN SETTINGS .....</b>	<b>136</b>
15.1.1 VLAN List .....	136
15.1.2 VLAN Settings.....	137
<b>15.2 GVRP CONFIGURATION .....</b>	<b>137</b>
15.2.1 GVRP Global Attribute Configuration.....	137
15.2.2 Global Interface Attribute Configuration .....	138
<b>15.3 STP CONFIGURATION .....</b>	<b>138</b>
15.3.1 STP Status Information .....	138
15.3.2 Configuring the Attributes of the STP Port.....	139
<b>15.4 IGMP-SNOOPING CONFIGURATION.....</b>	<b>140</b>
15.4.1 IGMP-Snooping Configuration .....	140

15.4.2 IGMP-Snooping VLAN List.....	140
15.4.3 Static Multicast Address .....	141
15.4.4 Multicast List .....	141
<b>15.5 SETTING STATIC ARP .....</b>	<b>142</b>
<b>15.6 STATIC MAC ADDRESS CONFIGURATION .....</b>	<b>142</b>
<b>15.7 LLDP CONFIGURATION .....</b>	<b>143</b>
15.7.1 Configuring the Global Attributes of LLDP .....	143
15.7.2 LLDP Port Attribute Configuration .....	144
<b>15.8 DDM CONFIGURATION .....</b>	<b>144</b>
<b>15.9 LINK AGGREGATION CONFIGURATION .....</b>	<b>144</b>
15.9.1 Port Aggregation Configuration .....	144
15.9.2 Configuring Load Balance of Port Aggregation Group.....	145
<b>15.10 EAPS RING PROTECTION CONFIGURATION.....</b>	<b>145</b>
15.10.1 EAPS Ring List.....	145
15.10.2 EAPS Ring Configuration.....	146
<b>15.11 MEAPS CONFIGURATION.....</b>	<b>146</b>
15.11.1 MEAPS Ring Configuration .....	146
15.11.2 MEAPS Ring Configuration .....	147
<b>15.12 BACKUP LINK PROTOCOL CONFIGURATION .....</b>	<b>147</b>
15.12.1 Backup Link Protocol Global Configuration .....	147
15.12.2 Backup Link Protocol Interface Configuration.....	148
<b>15.13 DHCP SNOOPING CONFIGURATION .....</b>	<b>149</b>
15.13.1 DHCP Snooping Global Attribute Configuration.....	149
15.13.2 DHCP Snooping VLAN Attribute Configuration.....	149
15.13.3 DHCP Snooping Interface Attribute Configuration .....	150
15.13.4 DHCP Snooping Manual Binding Configuration .....	150
<b>15.14 MTU CONFIGURATION .....</b>	<b>151</b>
<b>15.15 PDP CONFIGURATION .....</b>	<b>151</b>
15.15.1 Configuring the Global Attributes of PDP.....	151
15.15.2 Configuring the Attributes of the PDP Port.....	151
<b>15.16 STP CONFIGURATION .....</b>	<b>152</b>
15.16.1 STP Status Information .....	152
15.16.2 Configuring the Attributes of the STP Port .....	152
<b>15.17 IGMP-SNOOPING CONFIGURATION.....</b>	<b>153</b>
15.17.1 IGMP-Snooping Configuration .....	153
15.17.2 IGMP-Snooping VLAN List .....	153
15.17.3 Static Multicast Address .....	154
15.17.4 Multicast List .....	155
<b>15.18 SETTING STATIC ARP .....</b>	<b>155</b>

<b>15.19 RING PROTECTION CONFIGURATION .....</b>	<b>156</b>
15.19.1 EAPS Ring List.....	156
15.19.2 EAPS Ring Configuration.....	156
<b>15.20 EVC CONFIGURATION .....</b>	<b>157</b>
15.20.1 Global QinQ Configuration.....	157
15.20.2 Configuring the QinQ Port.....	157
<b>15.21 DDM CONFIGURATION .....</b>	<b>157</b>
<b>CHAPTER 16 LAYER 3 CONFIGURATION.....</b>	<b>159</b>
<b>16.1 CONFIGURING THE VLAN INTERFACE .....</b>	<b>159</b>
<b>16.2 SETTING THE STATIC ROUTE .....</b>	<b>160</b>
<b>16.3 IGMP AGENT .....</b>	<b>161</b>
16.3.1 Enabling the IGMP Agent.....	161
16.3.2 Setting the IGMP Agent.....	161
<b>CHAPTER 17 ADVANCED CONFIGURATION.....</b>	<b>162</b>
<b>17.1 QoS CONFIGURATION .....</b>	<b>162</b>
17.1.1 Configuring QoS Port.....	162
17.1.2 Global QoS Configuration .....	163
<b>17.2 MAC ACCESS CONTROL LIST .....</b>	<b>163</b>
17.2.1 Setting the Name of the MAC Access Control List .....	163
17.2.2 Setting the Rules of the MAC Access Control List.....	164
17.2.3 Applying the MAC Access Control List.....	164
<b>17.3 IP ACCESS CONTROL LIST .....</b>	<b>165</b>
17.3.1 Setting the Name of the IP Access Control List.....	165
17.3.2 Setting the Rules of the IP Access Control List.....	165
17.3.3 Applying the IP Access Control List .....	167
<b>CHAPTER 18 NETWORK MANAGEMENT CONFIGURATION .....</b>	<b>168</b>
<b>18.1 SNMP CONFIGURATION .....</b>	<b>168</b>
18.1.1 SNMP Community Management.....	168
18.1.2 SNMP Host Management .....	169
<b>18.2 RMON .....</b>	<b>169</b>
18.2.1 RMON Statistic Information Configuration .....	169
18.2.2 RMON History Information Configuration .....	170
18.2.3 RMON Alarm Information Configuration .....	170
18.2.4 RMON Event Configuration .....	171
<b>CHAPTER 19 DIAGNOSIS TOOLS .....</b>	<b>173</b>
<b>19.1 PING .....</b>	<b>173</b>
19.1.1 Ping.....	173

<b>CHAPTER 20 SYSTEM MANAGEMENT .....</b>	<b>175</b>
<b>20.1 USER MANAGEMENT .....</b>	<b>175</b>
20.1.1 User List .....	175
20.1.2 Establishing a New User .....	176
<b>20.2 LOG MANAGEMENT .....</b>	<b>176</b>
20.2.1 Managing the Configuration Files .....	177
20.2.2 Exporting the Configuration Information .....	177
20.2.3 Importing the Configuration Information.....	177
<b>20.3 SOFTWARE MANAGEMENT .....</b>	<b>178</b>
20.3.1 Backing up the IOS Software .....	178
20.3.2 Upgrading the IOS Software .....	178
<b>20.4 RESUMING INITIAL CONFIGURATION .....</b>	<b>179</b>
<b>20.5 REBOOTING THE DEVICE .....</b>	<b>179</b>
<b>CHAPTER 21 INTERFACE CONFIGURATION OVERVIEW .....</b>	<b>180</b>
<b>21.1 SUPPORTED INTERFACE TYPES .....</b>	<b>180</b>
<b>21.2 INTERFACE CONFIGURATION INTRODUCTION .....</b>	<b>180</b>
<b>CHAPTER 22 INTERFACE CONFIGURATION .....</b>	<b>182</b>
<b>22.1 CONFIGURING INTERFACE COMMON ATTRIBUTE.....</b>	<b>182</b>
<b>22.2 ADDING DESCRIPTION .....</b>	<b>182</b>
22.2.1 Configuring Bandwidth .....	182
22.2.2 Configuring Time Delay.....	182
<b>22.3 MONITORING AND MAINTAINING THE PORT .....</b>	<b>182</b>
22.3.1 Browsing the State of an Interface .....	183
22.3.2 Initializing and Deleting the Port .....	183
22.3.3 Closing and Restarting the Port.....	183
<b>22.4 SETTING THE ETHERNET INTERFACE .....</b>	<b>183</b>
22.4.1 Choosing an Ethernet Interface .....	184
22.4.2 Setting the Rate .....	184
22.4.3 Setting the Duplex Mode of an Interface.....	184
22.4.4 Setting Flow Control on an Interface.....	184
<b>22.5 CONFIGURING LOGICAL INTERFACE .....</b>	<b>185</b>
22.5.1 Configuring Null Interface.....	185
22.5.2 Configuring Loopback Interface .....	185
22.5.3 Configuring Aggregation Interface .....	185
22.5.4 Configuring VLAN Interface .....	186
22.5.5 Configuring SuperVLAN Interface.....	186
<b>CHAPTER 23 INTERFACE CONFIGURATION EXAMPLE .....</b>	<b>187</b>
<b>23.1 CONFIGURING PUBLIC ATTRIBUTE OF INTERFACE.....</b>	<b>187</b>

23.1.1 Example for Interface Description .....	187
23.1.2 Example of Interface Shutdown .....	187
<b>CHAPTER 24 INTERFACE RANGE CONFIGURATION .....</b>	<b>188</b>
<b>24.1 INTERFACE RANGE CONFIGURATION TASK.....</b>	<b>188</b>
24.1.1 Understanding Interface Range .....	188
24.1.2 Entering Interface Range Mode .....	188
24.1.3 Configuration Example.....	188
<b>CHAPTER 25 PORT ADDITIONAL CHARACTERISTICS CONFIGURATION.....</b>	<b>189</b>
<b>25.1 STORM BLOCK .....</b>	<b>189</b>
<b>25.2 PORT ISOLATION.....</b>	<b>189</b>
<b>25.3 STORM CONTROL .....</b>	<b>190</b>
<b>25.4 RATE LIMIT .....</b>	<b>190</b>
<b>25.5 LOOPBACK DETECTION.....</b>	<b>191</b>
<b>25.6 MAC ADDRESS LEARNING.....</b>	<b>191</b>
<b>25.7 PORT SECURITY .....</b>	<b>191</b>
<b>25.8 PORT BINDING.....</b>	<b>192</b>
<b>25.9 VLAN MAC ADDRESS LEARNING .....</b>	<b>193</b>
<b>25.10 VLAN MAC ADDRESS LEARNING NUMBER .....</b>	<b>193</b>
<b>25.11 PORT FEC .....</b>	<b>194</b>
<b>25.12 CONFIGURING LINK SCAN.....</b>	<b>194</b>
25.12.1 Overview .....	194
25.12.2 Link Scan Configuration Task.....	194
25.12.3 Configuration Example.....	195
<b>25.13 CONFIGURING SYSTEM MTU.....</b>	<b>195</b>
25.13.1 Overview .....	195
25.13.2 Configuration Task .....	195
25.13.3 Configuration Example.....	196
<b>CHAPTER 26 INTERFACE CONFIGURATION .....</b>	<b>197</b>
<b>26.1 CONFIGURING THE ETHERNET INTERFACE.....</b>	<b>197</b>
26.1.1 Configuring Flow Control for the Port.....	197
26.1.2 Configuring the Rate Unit for the Port.....	197
26.1.3 Configuring the Storm Control on the Port.....	198
<b>CHAPTER 27 SECURE PORT CONFIGURATION .....</b>	<b>199</b>
<b>27.1 OVERVIEW.....</b>	<b>199</b>
<b>27.2 CONFIGURATION TASK OF THE SECURE PORT.....</b>	<b>199</b>

<b>27.3 CONFIGURING THE SECURE PORT .....</b>	<b>199</b>
27.3.1 Configuring the Secure Port Mode.....	199
27.3.2 Configuring the Static MAC Address of the Secure Port .....	200
<b>CHAPTER 28 CONFIGURING PORT MIRRORING .....</b>	<b>201</b>
<b>28.1 CONFIGURING PORT MIRRORING TASK LIST .....</b>	<b>201</b>
<b>28.2 CONFIGURING PORT MIRRORING TASK .....</b>	<b>201</b>
28.2.1 Configuring Port Mirroring .....	201
28.2.2 Displaying Port Mirroring Information.....	201
<b>28.3 REMOTE MIRRORING CONFIGURATION EXAMPLE.....</b>	<b>201</b>
<b>CHAPTER 29 CONFIGURING MAC ADDRESS ATTRIBUTE.....</b>	<b>204</b>
<b>29.1 MAC ADDRESS CONFIGURATION TASK LIST .....</b>	<b>204</b>
<b>29.2 MAC ADDRESS CONFIGURATION TASK .....</b>	<b>204</b>
29.2.1 Configuring Static Mac Address.....	204
29.2.2 Configuring MAC Address Aging Time.....	204
29.2.3 Displaying MAC Address Table .....	205
29.2.4 Clearing Dynamic MAC Address.....	205
<b>CHAPTER 30 CONFIGURING MAC LIST .....</b>	<b>206</b>
<b>30.1 MAC LIST CONFIGURATION TASK .....</b>	<b>206</b>
30.1.1 Creating MAC List.....	206
30.1.2 Configuring Items of MAC List .....	206
30.1.3 Applying MAC List.....	207
<b>30.2 802.1X CONFIGURATION EXAMPLE .....</b>	<b>207</b>
<b>CHAPTER 31 VLAN CONFIGURATION .....</b>	<b>213</b>
<b>31.1 VLAN INTRODUCTION.....</b>	<b>213</b>
<b>31.2 DOT1Q TUNNEL OVERVIEW.....</b>	<b>213</b>
31.2.1 Preface .....	213
31.2.2 Dot1Q Tunnel Realization Mode .....	214
31.2.3 Modifying Attributes Through TPID Value .....	214
<b>31.3 VLANCONFIGURATION TASK LIST.....</b>	<b>215</b>
<b>31.4 VLAN CONFIGURATION TASK .....</b>	<b>215</b>
31.4.1 Adding/Deleting VLAN.....	215
31.4.2 Configuring the Port of the Switch .....	216
31.4.3 Creating/deleting the VLAN interface.....	216
31.4.4 Configuring the Super VLAN Interface.....	217
31.4.5 Monitoring the VLAN Configuration and VLAN State .....	217
31.4.6 Enabling or disabling Dot1 Q Tunnel globally and configuring TPID globally .....	218
31.4.7 enable/disable globalflat-translation.....	218
31.4.8 Configuring VLAN translation mode and items on a port.....	218

31.4.9 Setting MAC-Based VLAN .....	219
31.4.10 Setting IP Subnet-Based VLAN .....	219
31.4.11 Setting Protocol-Based VLAN .....	220
<b>31.5 CONFIGURATION EXAMPLE .....</b>	<b>221</b>
31.5.1 SuperVLAN Configuration Example.....	221
31.5.2 Dot1Q Tunnel Configuration Examples.....	221
<b>31.6 APPENDIX A ABBREVIATIONS .....</b>	<b>226</b>
<b>CHAPTER 32 CONFIGURING GVRP .....</b>	<b>227</b>
<b>32.1 INTRODUCTION .....</b>	<b>227</b>
<b>32.2 CONFIGURING TASK LIST .....</b>	<b>227</b>
32.2.1 GVRP Configuration Task List.....	227
<b>32.3 GVRP CONFIGURATION TASK .....</b>	<b>227</b>
32.3.1 Enabling/Disabling GVRP Globally .....	227
32.3.2 Dynamic VLAN to Validate only on a Registered Port .....	227
32.3.3 Enabling/Disabling GVRP on the Interface .....	227
32.3.4 Monitoring and Maintenance of GVRP .....	228
<b>32.4 CONFIGURATION EXAMPLE .....</b>	<b>229</b>
<b>CHAPTER 33 PRIVATE VLAN SETTINGS .....</b>	<b>230</b>
<b>33.1 OVERVIEW OF PRIVATE VLAN .....</b>	<b>230</b>
<b>33.2 PRIVATE VLAN TYPE AND PORT TYPE IN PRIVATE VLAN .....</b>	<b>230</b>
33.2.1 Having One Primary VLAN Type .....	230
33.2.2 Having Two Secondary VLAN Types .....	230
33.2.3 Port Types Under the Private VLAN Port.....	230
33.2.4 Modifying the Fields in VLAN TAG .....	230
<b>33.3 PRIVATE VLAN CONFIGURATION TASK LIST .....</b>	<b>231</b>
<b>33.4 PRIVATE VLAN CONFIGURATION TASKS .....</b>	<b>231</b>
33.4.1 Configuring Private VLAN .....	231
33.4.2 Configuring the Association of Private VLAN Domains .....	231
33.4.3 Configuring the L2 Port of Private VLAN to Be the Host Port.....	232
33.4.4 Configuring the L2 Port of Private VLAN to Be the Promiscuous Port .....	232
33.4.5 Modifying Related Fields of Egress Packets in Private VLAN .....	233
33.4.6 Displaying the Configuration Information of Private VLAN .....	233
<b>33.5 CONFIGURATION EXAMPLE .....</b>	<b>234</b>
<b>CHAPTER 34 CONFIGURING STP .....</b>	<b>237</b>
<b>34.1 STP INTRODUCTION.....</b>	<b>237</b>
<b>34.2 SSTPCONFIGURATION TASK LIST .....</b>	<b>238</b>
<b>34.3 SSTP CONFIGURATION TASKS .....</b>	<b>238</b>
34.3.1 Choosingthe STP Mode .....	238

34.3.2 Disabling/Enabling STP .....	238
34.3.3 Disabling/Enabling STP on a Port.....	238
34.3.4 Setting the Bridge Priority .....	239
34.3.5 Setting the Hello Time .....	239
34.3.6 Setting the Max Age .....	239
34.3.7 Setting the Forward Delay .....	239
34.3.8 Setting the PortPriority .....	240
34.3.9 Value of the path cost of a port .....	240
34.3.10 Monitoring the STP state.....	240
34.3.11 Setting the SNMP Trap.....	240
<b>34.4 SETTING THE SPANNING TREE OF VLAN .....</b>	<b>241</b>
34.4.1 Overview .....	241
34.4.2 VLAN STP Configuration Tasks .....	241
<b>CHAPTER 35 CONFIGURING RSTP.....</b>	<b>243</b>
<b>35.1 RSTP CONFIGURATION TASK LIST .....</b>	<b>243</b>
<b>35.2 RSTP CONFIGURATION TASKS.....</b>	<b>243</b>
35.2.1 Enabling/disabling RSTP of the Switch.....	243
35.2.2 Setting the Bridge Priority .....	243
35.2.3 Setting the Forward Time .....	243
35.2.4 Setting the Hello Time .....	244
35.2.5 Setting the Max Age .....	244
35.2.6 Value of the path cost of a port .....	245
35.2.7 Setting the Port Priority .....	245
35.2.8 Setting the Edge Port.....	245
35.2.9 Setting the Port Connection Type .....	246
35.2.10 Restarting the protocol conversion check.....	246
<b>CHAPTER 36 CONFIGURING MSTP .....</b>	<b>247</b>
<b>36.1 MSTP INTRODUCTION.....</b>	<b>247</b>
36.1.1 Overview .....	247
36.1.2 MST Region .....	247
36.1.3 IST, CST, CIST and MSTI .....	247
36.1.4 Port Role .....	252
36.1.5 MSTP BPDU .....	259
36.1.6 Stable State.....	260
36.1.7 Hop Count.....	261
36.1.8 STP Compatibility.....	261
<b>36.2 MSTP CONFIGURATION TASK LIST.....</b>	<b>261</b>
<b>36.3 MSTP CONFIGURATION TASKS .....</b>	<b>262</b>
36.3.1 Default MSTP Configuration .....	262
36.3.2 Enabling and disabling MSTP .....	262
36.3.3 Configuring MSTP region.....	263

36.3.4 Configuring network root.....	263
36.3.5 Configuring secondary root.....	264
36.3.6 Configuring Bridge Priority .....	265
36.3.7 Configuring time parameters of STP.....	265
36.3.8 Configuring network diameter .....	266
36.3.9 Configuring maximum hop count .....	267
36.3.10 Setting the Port Priority .....	267
36.3.11 Value of the path cost of a port.....	267
36.3.12 Setting the Edge Port.....	268
36.3.13 Setting the Port Connection Type .....	268
36.3.14 Activating MST-compatible mode.....	268
36.3.15 Restarting the protocol conversion check.....	269
36.3.16 Configuring role restriction of the port.....	270
36.3.17 Configuring TCN restriction of the port .....	270
36.3.18 Check MSTP information .....	270

## **CHAPTER 37 CONFIGURING STP OPTIONAL CHARACTERISTIC ..... 271**

<b>37.1 STP OPTIONAL CHARACTERISTIC INTRODUCTION .....</b>	<b>271</b>
37.1.1 Port Fast.....	271
37.1.2 BPDU Guard .....	272
37.1.3 BPDU Filter .....	272
37.1.4 Uplink Fast .....	273
37.1.5 Backbone Fast .....	274
37.1.6 Root Guard.....	275
37.1.7 Loop Guard .....	276
<b>37.2 CONFIGURING STP OPTIONAL CHARACTERISTIC.....</b>	<b>276</b>
37.2.1 STP Optional Characteristic Configuration Task.....	276
37.2.2 Configuring Port Fast .....	277
37.2.3 Configuring BPDU Guard.....	277
37.2.4 Configuring BPDU Filter.....	278
37.2.5 Configuring Uplink Fast.....	279
37.2.6 Configuring Backbone Fast.....	279
37.2.7 Configuring Root Guard .....	279
37.2.8 Configuring Loop Guard.....	280
37.2.9 Configuring Loop Fast.....	280
37.2.10 Configuring Address Table Aging Protection.....	281
37.2.11 Configuring FDB-Flush.....	282
37.2.12 Configuring BPDU Terminal .....	282

## **CHAPTER 38 CONFIGURING PORT AGGREGATION..... 283**

<b>38.1 OVERVIEW.....</b>	<b>283</b>
<b>38.2 PORT AGGREGATION CONFIGURATION TASK.....</b>	<b>283</b>
<b>38.3 PORT AGGREGATION CONFIGURATION TASK.....</b>	<b>283</b>
38.3.1 Configuring Logical Channel Used to Aggregation .....	283

38.3.2 Aggregation of Physical Port.....	283
38.3.3 Selecting Load Balance Method After Port Aggregation.....	284
38.3.4 Monitoring the Concrete Conditions of Port Aggregation.....	285
<b>CHAPTER 39 PDP OVERVIEW .....</b>	<b>286</b>
<b>39.1 OVERVIEW.....</b>	<b>286</b>
<b>39.2 PDP CONFIGURATION TASKS.....</b>	<b>286</b>
39.2.1 Default PDP Configuration.....	286
39.2.2 Setting the PDP Clock and Information Storage.....	286
39.2.3 Setting the PDP Version.....	287
39.2.4 Starting PDP on a Switch.....	287
39.2.5 Starting PDP on a Port.....	287
39.2.6 PDP Monitoring and Management.....	287
<b>39.3 PDP CONFIGURATION EXAMPLE.....</b>	<b>287</b>
<b>CHAPTER 40 LINK LAYER 2 DISCOVERY PROTOCOL (LLDP).....</b>	<b>289</b>
<b>40.1 LLDP OVERVIEW .....</b>	<b>289</b>
<b>40.2 INITIALIZING THE PROTOCOL.....</b>	<b>289</b>
40.2.1 Initializing LLDP Transmit Mode.....	289
40.2.2 Initializing LLDP Reception Mode .....	290
40.2.3 LLDP PDU Packet Structure Description.....	290
<b>40.3 LLDP CONFIGURATION TASK LIST .....</b>	<b>291</b>
<b>40.4 LLDP CONFIGURATION TASKS.....</b>	<b>291</b>
40.4.1 Disabling/enabling LLDP.....	291
40.4.2 Configuring holdtime .....	291
40.4.3 Configuring Timer.....	292
40.4.4 Configuring Reinit.....	292
40.4.5 Configuring the To-Be-Sent TLV .....	293
40.4.6 Specifying the Port's Configuration and Selecting the To-Be-Sent Expanded TLV .....	294
40.4.7 Configuring the Transmission or Reception Mode.....	296
40.4.8 Specifying the Management IP Address of a Port .....	296
40.4.9 Sending Trap Notification to mib Database.....	297
40.4.10 Configuring the Location Information .....	297
40.4.11 Specifying a Port to Set the Location Information.....	299
40.4.12 Configuring Show-Relative Commands.....	299
40.4.13 Configuring the Delete Commands.....	300
<b>40.5 CONFIGURATION EXAMPLE.....</b>	<b>300</b>
40.5.1 Network Environment Requirements .....	300
40.5.2 Network Topology.....	300
40.5.3 Configuration Procedure .....	300
<b>CHAPTER 41 INTRODUCTION OF FAST ETHERNET RING PROTECTION .....</b>	<b>308</b>

<b>41.1 OVERVIEW</b> .....	<b>308</b>
<b>41.2 RELATED CONCEPTS OF FAST ETHER-RING PROTECTION</b> .....	<b>308</b>
41.2.1 Roles of Ring's Nodes.....	308
41.2.2 Role of the Ring's Port .....	309
41.2.3 Control VLAN and Data VLAN .....	309
41.2.4 Aging of the MAC Address Table .....	310
41.2.5 Symbol of a Complete Ring Network .....	310
<b>41.3 TYPES OF EAPS PACKETS</b> .....	<b>310</b>
<b>41.4 FAST ETHERNET RING PROTECTION MECHANISM</b> .....	<b>310</b>
41.4.1 Ring Detection and Control of Master Node .....	310
41.4.2 Notification of Invalid Link of Transit Node .....	311
41.4.3 Resuming the Link of the Transit Node.....	311
<b>41.5 FAST ETHERNET RING PROTECTION CONFIGURATION</b> .....	<b>311</b>
<b>41.6 DEFAULT EAPS SETTINGS</b> .....	<b>311</b>
<b>41.7 REQUISITES BEFORE CONFIGURATION</b> .....	<b>312</b>
<b>41.8 MEAPS CONFIGURATION TASKS</b> .....	<b>312</b>
<b>41.9 FAST ETHERNET RING PROTECTION CONFIGURATION</b> .....	<b>312</b>
41.9.1 Configuring the Master Node .....	312
41.9.2 Configuring the Transit Node .....	313
41.9.3 Configuring the Ring Port.....	313
41.9.4 Browsing the State of the Ring Protection Protocol .....	314
<b>41.10 MEAPS CONFIGURATION</b> .....	<b>314</b>
41.10.1 Configuration Example.....	314
<b>CHAPTER 42 IGMP SNOOPING CONFIGURATION</b> .....	<b>316</b>
<b>42.1 IGMP SNOOPING CONFIGURATION TASK</b> .....	<b>316</b>
42.1.1 Enabling/Disabling IGMP Snooping of VLAN .....	316
42.1.2 Adding/Deleting Static Multicast Address of VLAN .....	317
42.1.3 Configuring Immediate-leave of VLAN.....	317
42.1.4 Configuring Static Routing Interface of VLAN.....	317
42.1.5 Configuring IPACL of Generating Multicast Forward Table.....	317
42.1.6 Configuring the Function to Filter Multicast Message Without Registered Destination Address .....	318
42.1.7 Configuring Router Age Timer of IGMP Snooping .....	318
42.1.8 Configuring Response Time of IGMP Snooping .....	318
42.1.9 Configuring Querier of IGMP Snooping .....	319
42.1.10 Configuring IGMP Snooping's Querier Time.....	319
42.1.11 Configuring Filter of IGMP Snooping.....	320
42.1.12 Configuring Clear-group of IGMP Snooping .....	320
42.1.13 Configuring quick-query of IGMP-snooping .....	320
42.1.14 Configuring Decrease-query-report-for-mvc of IGMP Snooping.....	321
42.1.15 Configuring no-send-special-query of IGMP-snooping.....	321

42.1.16 Configuring Forward-L3-to-Mrouter of IGMP Snooping to Forward the Data Packets to the Routing Port .....	321
42.1.17 Configuring Sensitive mode and Value for IGMP Snooping .....	322
42.1.18 Configuring IGMP Snooping's v3-leave-check Function .....	322
42.1.19 Configuring IGMP Snooping's forward-wrongiif-within-vlan Function.....	323
42.1.20 Configuring IGMP-snooping's IPACL function at port.....	323
42.1.21 Configuring maximum multicast IP address quantity function at IGMP-snooping's port ...	323
42.1.22 Monitoring and Maintaining IGMP-Snooping .....	324
42.1.23 IGMP-Snooping Configuration Example.....	325
<b>CHAPTER 43 IGMP PROXY CONFIGURATION .....</b>	<b>327</b>
<b>43.1 IGMP PROXY CONFIGURATION TASKS.....</b>	<b>327</b>
43.1.1 Enabling/Disabling IGMP-Proxy.....	327
43.1.2 Adding/Deleting VLAN Agent Relationship .....	327
43.1.3 Adding/Deleting Static Multicast Source Entries .....	328
43.1.4 Monitoring and Maintaining IGMP-Proxy .....	328
43.1.5 IGMP Proxy Configuration Example .....	329
<b>CHAPTER 44 CHAPTER 1 DHCP SNOOPING CONFIGURATION .....</b>	<b>330</b>
<b>44.1 IGMP SNOOPING CONFIGURATION TASKS .....</b>	<b>330</b>
44.1.1 Enabling/Disabling DHCP Snooping.....	330
44.1.2 Enabling DHCP Snooping in a VLAN .....	331
44.1.3 Enabling DHCP Anti-attack in a VLAN.....	331
44.1.4 Setting an Interface to a DHCP-Trusting Interface .....	331
44.1.5 Enabling/Disabling Binding Table Fast Update Function .....	332
44.1.6 Enabling DAI in a VLAN .....	332
44.1.7 Setting an Interface to an ARP-Trusting Interface .....	332
44.1.8 Enabling Source IP Address Monitoring in a VLAN .....	332
44.1.9 Setting an Interface to the One Which is Trusted by IP Source Address Monitoring.....	333
44.1.10 Setting DHCP Snooping Option 82.....	333
44.1.11 Setting the Policy of DHCP Snooping Option82 Packets .....	335
44.1.12 Setting the TFTP Server for Backing Up Interface Binding .....	335
44.1.13 Setting a File Name for Interface Binding Backup.....	336
44.1.14 Setting the Interval for Checking Interface Binding Backup.....	336
44.1.15 Setting Interface Binding Manually .....	337
44.1.16 Monitoring and Maintaining DHCP-Snooping .....	337
44.1.17 Example of DHCP Snooping Configuration .....	338
<b>CHAPTER 45 CONFIGURING LAYER 2 PROTOCOL TUNNEL.....</b>	<b>341</b>
<b>45.1 INTRODUCTION .....</b>	<b>341</b>
<b>45.2 CONFIGURING LAYER 2 PROTOCOL TUNNEL.....</b>	<b>341</b>
<b>45.3 CONFIGURATION EXAMPLE OF LAYER 2 PROTOCOL TUNNEL.....</b>	<b>341</b>
<b>CHAPTER 46 QOS CONFIGURATION.....</b>	<b>343</b>

<b>46.1 QoS OVERVIEW .....</b>	<b>343</b>
46.1.1 QoS Concept.....	343
46.1.2 Terminal-To-Terminal QoS Model.....	343
46.1.3 Queue Algorithm of QoS .....	345
46.1.4 Weighted Random Early Detection .....	349
<b>46.2 QoS CONFIGURATION TASK LIST .....</b>	<b>351</b>
<b>46.3 QoS CONFIGURATION TASKS.....</b>	<b>352</b>
46.3.1 Setting the Global CoS Priority Queue .....	352
46.3.2 Setting Global Cos to Local Priority Mapping .....	352
46.3.3 Setting the Bandwidth of the CoS Priority Queue .....	353
46.3.4 Setting the Schedule Policy of the CoS Priority Queue .....	353
46.3.5 Configuring the Minimum and Maximum Bandwidths of CoS Priority Queue .....	354
46.3.6 Setting the Default CoS Value of a Port.....	354
46.3.7 Setting the CoS Priority Queue of a Port .....	354
46.3.8 Setting Cos Priority Queue Based on dscp.....	355
46.3.9 Setting QoS Policy Mapping .....	355
46.3.10 Setting the Description of the QoS Policy Mapping .....	356
46.3.11 Setting the Matchup Data Flow of the QoS Policy Mapping .....	356
46.3.12 Setting the Actions of the Match-up Data Flow of the QoS Policy Mapping .....	357
46.3.13 Applying the QoS Policy on a Port.....	358
46.3.14 Configuring the Trust Mode.....	359
46.3.15 Displaying the QoS Policy Mapping Table .....	359
<b>46.4 QoS CONFIGURATION EXAMPLE .....</b>	<b>360</b>
46.4.1 Example for Applying the QoS Policy on a Port.....	360
<b>46.5 DoS ATTACK OVERVIEW.....</b>	<b>360</b>
<b>CHAPTER 47 DOS ATTACK PREVENTION CONFIGURATION.....</b>	<b>361</b>
<b>47.1 CONCEPT OF DoS ATTACK .....</b>	<b>361</b>
<b>47.2 DoS ATTACK TYPE.....</b>	<b>361</b>
<b>47.3 DoS ATTACK PREVENTION CONFIGURATION TASK LIST .....</b>	<b>365</b>
<b>47.4 DoS ATTACK PREVENTION CONFIGURATION TASKS.....</b>	<b>365</b>
47.4.1 Configuring Global DoS Attack Prevention .....	365
47.4.2 Displaying All DoS Attack Prevention Configurations .....	366
<b>47.5 DoS ATTACK PREVENTION CONFIGURATION EXAMPLE.....</b>	<b>366</b>
<b>CHAPTER 48 ATTACK PREVENTION INTRODUCTION.....</b>	<b>367</b>
<b>48.1 OVERVIEW OF FILTER.....</b>	<b>367</b>
<b>48.2 THE MODE OF FILTER.....</b>	<b>367</b>
<b>CHAPTER 49 ATTACK PREVENTION CONFIGURATION .....</b>	<b>368</b>
<b>49.1 ATTACK PREVENTION CONFIGURATION TASKS.....</b>	<b>368</b>

<b>49.2 ATTACK PREVENTION CONFIGURATION .....</b>	<b>368</b>
<b>49.3 CONFIGURING THE ATTACK FILTER PARAMETERS .....</b>	<b>368</b>
49.3.1 Configuring the Attack Prevention Type.....	369
49.3.2 Enabling the Attack Prevention Function .....	370
49.3.3 Checking the State of Attack Prevention.....	370
<b>CHAPTER 50 ATTACK PREVENTION CONFIGURATION EXAMPLE .....</b>	<b>371</b>
<b>50.1 USING FILTER ARP TO PROTECT THE LAN.....</b>	<b>371</b>
<b>50.2 USING FILTER IP TO PROTECT LAYER-3 NETWORK.....</b>	<b>372</b>
<b>CHAPTER 51 CONFIGURING IP ADDRESSING .....</b>	<b>373</b>
<b>51.1 IP INTRODUCTION .....</b>	<b>373</b>
51.1.1 IP .....	373
51.1.2 IP Routing Protocol .....	373
<b>51.2 CONFIGURING IP ADDRESS TASK LIST .....</b>	<b>374</b>
<b>51.3 CONFIGURING IP ADDRESS .....</b>	<b>374</b>
51.3.1 Configuring IP Address at the Network Interface.....	374
51.3.2 Configuring Multiple IP Addresses at the Network Interface.....	375
51.3.3 Configuring Address Resolution.....	376
51.3.4 Configuring Routing Process .....	379
51.3.5 Configuring Broadcast Packet Process .....	379
51.3.6 Detecting and Maintaining IP Address .....	381
<b>51.4 IP ADDRESSING EXAMPLE.....</b>	<b>381</b>
<b>CHAPTER 52 CONFIGURING DHCP .....</b>	<b>382</b>
<b>52.1 OVERVIEW.....</b>	<b>382</b>
52.1.1 DHCP Application.....	382
52.1.2 Advantages of DHCP .....	382
52.1.3 DHCP Terms .....	382
<b>52.2 CONFIGURING DHCP CLIENT .....</b>	<b>383</b>
52.2.1 Configuration Task List of DHCP Client .....	383
52.2.2 DHCP Client Configuration Tasks .....	383
52.2.3 DHCP Client Configuration Example .....	384
<b>52.3 CONFIGURING DHCP SERVER.....</b>	<b>385</b>
52.3.1 DHCP Server Configuration Tasks .....	385
52.3.2 Setting the Address Pool of DHCP Server .....	385
52.3.3 DHCP Server Configuration Example.....	391
<b>52.4 CONFIGURING DHCP RELAY .....</b>	<b>392</b>
52.4.1 Configuration Task List of DHCP Relay .....	392
52.4.2 DHCP Relay Configuration Tasks .....	392
52.4.3 DHCP Relay Configuration Example .....	392

<b>CHAPTER 53 CHAPTER 3 IP SERVICE CONFIGURATION .....</b>	<b>393</b>
<b>53.1 CONFIGURING IP SERVICE.....</b>	<b>393</b>
53.1.1 Managing IP Connection.....	393
53.1.2 Configuring Performance Parameters .....	397
53.1.3 Detecting and Maintaining IP Network.....	398
<b>53.2 CONFIGURING ACCESS LIST.....</b>	<b>399</b>
53.2.1 Filtering IP Packet.....	399
53.2.2 Creating Standard and Extensible IP Access List.....	400
53.2.3 Applying the Access List to the Routing Interface.....	401
53.2.4 Applying the Access List to the Global Mode.....	402
53.2.5 Applying the Access List to the Physical Interface.....	402
53.2.6 Extensible Access List Example .....	402
<b>CHAPTER 54 APPLICATION OF IP ACCESS CONTROL LIST .....</b>	<b>404</b>
<b>54.1 APPLYING THE IP ACCESS CONTROL LIST .....</b>	<b>404</b>
54.1.1 Applying ACL on Ports .....	404
<b>CHAPTER 55 ROUTING PROTOCOL OVERVIEW.....</b>	<b>405</b>
<b>55.1 IP ROUTING PROTOCOL .....</b>	<b>405</b>
<b>55.2 CHOOSING ROUTING PROTOCOL .....</b>	<b>405</b>
55.2.1 Interior Gateway Router Protocol.....	405
55.2.2 Exterior Gateway Routing Protocol.....	406
<b>CHAPTER 56 CONFIGURING VRF .....</b>	<b>407</b>
<b>56.1 OVERVIEW.....</b>	<b>407</b>
<b>56.2 VRF CONFIGURATION TASK LIST .....</b>	<b>407</b>
<b>56.3 CONFIGURATION TASK .....</b>	<b>407</b>
56.3.1 Creating VRF Table.....	407
56.3.2 Relating the interface to VRF.....	407
56.3.3 Configuring the Target VPN Expansion Attribute of VRF.....	408
56.3.4 Configuring Description of VRF .....	408
56.3.5 Configuring Static Route of VRF.....	409
56.3.6 Monitoring VRF .....	409
56.3.7 Maintaining VRF.....	409
<b>56.4 EXAMPLE OF THE VRF CONFIGURATION .....</b>	<b>410</b>
<b>CHAPTER 57 STATIC ROUTING CONFIGURATION.....</b>	<b>414</b>
<b>57.1 OVERVIEW.....</b>	<b>414</b>
<b>57.2 STATIC ROUTING CONFIGURATION TASK LIST .....</b>	<b>414</b>
<b>57.3 STATIC ROUTING CONFIGURATION TASK.....</b>	<b>415</b>
57.3.1 Configure the Static Routing.....	415

57.4 EXAMPLE OF THE STATIC ROUTING CONFIGURATION .....	415
<b>CHAPTER 58 CONFIGURING RIP .....</b>	<b>416</b>
58.1 OVERVIEW.....	416
58.2 RIP CONFIGURATION TASK LIST.....	416
58.3 RIP CONFIGURATION TASK .....	417
58.3.1 Starting the RIP .....	417
58.3.2 Allowing the mono-broadcasting updaed and grouped by RIP Router.....	417
58.3.3 Using the Offsets on the Route metric .....	417
58.3.4 Regulating the Timer .....	417
58.3.5 Appointing the RIP Version Number .....	418
58.3.6 Enabling the RIP Authentication .....	418
58.3.7 Activating the 'Passive' and 'Deaf' of the Interface .....	419
58.3.8 Activating RIP Authentication .....	419
58.3.9 Prohibitting the Route summary.....	420
58.3.10 Prohibitting the Authentication of Source IP Address .....	420
58.3.11 Maximum Number of Routes.....	421
58.3.12 Activating or Prohibit the Horizontal Split.....	421
58.3.13 Monitoring and Maintainance of RIP.....	422
58.4 EXAMPLE OF THE RIP CONFIGURATION.....	422
<b>CHAPTER 59 BEIGRP CONFIGURATION.....</b>	<b>424</b>
59.1 OVERVIEW.....	424
59.2 BEIGRP CONFIGURATION TASK LIST.....	424
59.2.1 Activating BEIGRP Protocol.....	425
59.2.2 Configuring the Sharable Percentage of Bandwidth.....	425
59.2.3 Adjusting the Arithmetic Coefficient of BEIGRP Composite Distance.....	425
59.2.4 Using "Offset" to Adjust the Composite Distance of the Router.....	425
59.2.5 Turning off Auto-Summary .....	426
59.2.6 Customizing Route Summary .....	426
59.2.7 Redistributing Other Routes into the BEIGRP Process .....	426
59.2.8 Configuring Other Parameters of BEIGRP .....	427
59.2.9 Monitoring and Maintaining BEIGRP .....	430
59.3 EXAMPLES OF BEIGRP CONFIGURATION.....	430
<b>CHAPTER 60 CONFIGURING OSPF .....</b>	<b>431</b>
60.1 OVERVIEW.....	431
60.2 OSPF CONFIGURATION TAST LIST .....	431
60.3 OSPF CONFIGURATION TAST.....	432
60.3.1 Starting OSPF .....	432
60.3.2 Configuring the Interface Parameter of OSPF.....	432
60.3.3 Configuring OSPF Network Type.....	432

60.3.4 Configuring One-to-Multiple Broadcast Network .....	433
60.3.5 Configuring Non-Broadcasting Network.....	434
60.3.6 Configure OSPF domain.....	435
60.3.7 Configuring the NSSA Area of OSPF.....	435
60.3.8 Configuring Route Summary Within OSPF Domain .....	435
60.3.9 Configuring the Gathering of a Forwarding Router.....	436
60.3.10 Creating Default Route.....	436
60.3.11 Selecting Router ID Through Loopback Interface .....	436
60.3.12 Configuring the Management Distance of OSPF.....	436
60.3.13 Configuring the Route Calculation Timer .....	437
60.3.14 Configuring the On-Demand Link .....	437
60.3.15 Monitoring and Maintaining OSPF .....	438
<b>60.4 EXAMPLES OF OSPF CONFIGURATION .....</b>	<b>438</b>
60.4.1 Examples of OSPF one-to-multi Point Configuration.....	438
60.4.2 Examples of OSPF point to multipoints, non-broadcasting configuration.....	440
60.4.3 Examples of the configuration of variable length sub-network masks.....	440
60.4.4 Examples of the configuration of OSPF route and route distribution.....	441
<b>CHAPTER 61 CONFIGURE BGP .....</b>	<b>449</b>
<b>61.1 OVERVIEW.....</b>	<b>449</b>
61.1.1 The BGP implementation of the router .....	449
61.1.2 How does BGP select the path .....	449
<b>61.2 BGP CONFIGURATION TASK LIST.....</b>	<b>450</b>
61.2.1 Basic configuration task list of BGP .....	450
61.2.2 Advanced BGP configuration tasks list.....	450
<b>61.3 CONFIGURE BASIC BGP FEATURES TAST .....</b>	<b>451</b>
61.3.1 Configuring Basic BGP Features .....	451
61.3.2 Configuring advanced BGP features .....	455
<b>61.4 MONITORING AND MAINTAINING BGP .....</b>	<b>459</b>
61.4.1 Deleting the BGP Routing Table and the BGP Database. ....	460
61.4.2 Displaying the Routing Table and the System Statistics Information.....	460
61.4.3 Tracking the BGP Information .....	461
<b>61.5 EXAMPLES OF BGP CONFIGURATION .....</b>	<b>461</b>
61.5.1 Example of BGP Route Map.....	461
61.5.2 Example of Neighbour Configuration .....	462
61.5.3 Example of BGP Route Filtration based on the Neighbor .....	462
61.5.4 Examples of BGP Route Filtration based on the Interface .....	463
61.5.5 Examples of Using Prefix List to Configure Route Filtration .....	463
61.5.6 Example of BGP Route Aggregation.....	464
61.5.7 Example of BGP Route Reflector .....	464
61.5.8 Example of BGP Confederation.....	466
61.5.9 Example of Route Map with BGP Group Attribute .....	468

<b>CHAPTER 62 CONFIGURING RSVP .....</b>	<b>470</b>
<b>62.1 OVERVIEW.....</b>	<b>470</b>
<b>62.2 RSVP CONFIGURATION TASK LIST.....</b>	<b>470</b>
<b>62.3 RSVP CONFIGURATION TASK .....</b>	<b>470</b>
62.3.1 Enable a RSVP on a Router .....	470
62.3.2 Start RSVP in an IP Phone Module Configuration.....	471
62.3.3 Use RSVP to Configure Command.....	471
62.3.4 Configure TOS and Precedence for RSVP flow .....	471
62.3.5 Use Access List in RSVP Module .....	472
<b>CHAPTER 63 CONFIGURING PBR .....</b>	<b>473</b>
<b>63.1 OVERVIEW.....</b>	<b>473</b>
<b>63.2 PBR CONFIGURATION TASK LIST .....</b>	<b>473</b>
<b>63.3 PBR CONFIGURATION TASK.....</b>	<b>473</b>
63.3.1 Create STANDARD Access List.....	473
63.3.2 Create ROUTE-map.....	473
63.3.3 Apply route-MAP on interface .....	474
63.3.4 Debug PBR .....	474
<b>63.4 PBR CONFIGUTION EXAMPLE .....</b>	<b>474</b>
<b>CHAPTER 64 CONFIGURING DNS .....</b>	<b>476</b>
<b>64.1 OVERVIEW.....</b>	<b>476</b>
64.1.1 DNS APPLICATION .....	476
64.1.2 DNS Term.....	476
<b>64.2 DNS CONFIGURATION TASK LIST .....</b>	<b>477</b>
<b>64.3 DNS CONFIGURATION TASK.....</b>	<b>477</b>
64.3.1 Enable DNS-based host name-to-address translation .....	477
64.3.2 Specify the IP address of a domain name server .....	478
64.3.3 Set a default domain name .....	478
64.3.4 Define a list of domains.....	478
64.3.5 Define static host name-to-address mapping .....	479
64.3.6 Specify times to retry a DNS query.....	479
64.3.7 Specify timeout waiting for response to a DNS query .....	479
64.3.8 Delete the mapping of a host name to IP address in cache .....	479
64.3.9 Specify the IP address of a primary server .....	480
64.3.10 Enable update function of dynamic DNS .....	480
64.3.11 Set the period of DNS update .....	480
64.3.12 Bind the domain name to a IP address or IP address of interface .....	480
64.3.13 The function of information showing or debug showing.....	481
<b>64.4 EXAMPLES OF BGP CONFIGURATION.....</b>	<b>482</b>
<b>CHAPTER 65 IP HARDWARE SUBNET ROUTING CONFIGURATION .....</b>	<b>483</b>

<b>65.1 IP HARDWARE SUBNET CONFIGURATION TASK .....</b>	<b>483</b>
65.1.1 Overview .....	483
65.1.2 Configuring IP Hardware Subnet Routing .....	483
<b>65.2 CONFIGURATION EXAMPLE .....</b>	<b>483</b>
<b>CHAPTER 66 IP-PBR CONFIGURATION .....</b>	<b>485</b>
<b>66.1 IP-PBR CONFIGURATION .....</b>	<b>485</b>
66.1.1 Enabling or Disabling IP-PBR Globally .....	485
66.1.2 ISIS Configuration Task List .....	485
66.1.3 Monitoring and Maintaining MVC .....	486
66.1.4 IP-PBR Configuration Example .....	487
<b>CHAPTER 67 MULTI-VRF CE INTRO .....</b>	<b>489</b>
<b>67.1 OVERVIEW .....</b>	<b>489</b>
67.1.1 Establishing Routes with CE .....	489
67.1.2 Establishing Routes with PE .....	490
<b>CHAPTER 68 MULTI-VRF CE CONFIGURATION .....</b>	<b>491</b>
<b>68.1 DEFAULT VRF CONFIGURATION .....</b>	<b>491</b>
<b>68.2 MCE CONFIGURATION TASKS .....</b>	<b>491</b>
<b>68.3 MCE CONFIGURATION .....</b>	<b>491</b>
68.3.1 Configuring VRF .....	491
68.3.2 Configuring VPN Route .....	492
68.3.3 Configuring the BGP Route Between PE and CE .....	492
68.3.4 Testifying the VRF Connectivity Between PE and CE .....	493
<b>CHAPTER 69 MCE CONFIGURATION EXAMPLE .....</b>	<b>494</b>
<b>69.1 CONFIGURING S11 .....</b>	<b>494</b>
<b>69.2 CONFIGURING MCE-S1 .....</b>	<b>494</b>
<b>69.3 CONFIGURING PE .....</b>	<b>496</b>
<b>69.4 CONFIGURING MCE-S2 .....</b>	<b>497</b>
<b>69.5 SETTING S22 .....</b>	<b>499</b>
<b>69.6 TESTIFYING VRF CONNECTIVITY .....</b>	<b>499</b>
<b>CHAPTER 70 VRRP CONFIGURATION .....</b>	<b>501</b>
<b>70.1 OVERVIEW .....</b>	<b>501</b>
<b>70.2 VRRP CONFIGURATION TASK LIST .....</b>	<b>501</b>
<b>70.3 VRRP CONFIGURATION TASK .....</b>	<b>501</b>
70.3.1 Configuring VRRP Virtual IP Address .....	501
70.3.2 Configuring VRRP Authentication Mode .....	501
70.3.3 Configuring VRRP Description .....	502

70.3.4 Configuring VRRP Priority Preemption .....	502
70.3.5 Configuring VRRP Protocol Packet MAC Address .....	502
70.3.6 Configuring VRRP Priority.....	503
70.3.7 Configuring VRRP Clock Value.....	503
70.3.8 Configuring VRRP Monitoring Object .....	503
70.3.9 Monitoring and Maintaining VRRP.....	504
70.3.10 VRRP Configuration Example.....	504
<b>CHAPTER 71 MULTICAST OVERVIEW .....</b>	<b>508</b>
<b>71.1 MULTICAST ROUTING REALIZATION .....</b>	<b>508</b>
<b>71.2 MULTICAST ROUTING CONFIGURATION TASK LIST.....</b>	<b>509</b>
71.2.1 Basic Multicast Configuration Task List.....	509
71.2.2 IGMP Configuration Task List.....	509
71.2.3 PIM-DM CONFIGURATION Task List.....	509
71.2.4 PIM-SM Configuration Task List.....	510
<b>CHAPTER 72 BASIC MULTICAST ROUTING CONFIGURATION.....</b>	<b>511</b>
<b>72.1 STARTING UP MULTICAST ROUTING .....</b>	<b>511</b>
<b>72.2 STARTING UP THE MULTICAST FUNCTION ON THE PORT .....</b>	<b>511</b>
72.2.1 Starting up PIM-DM.....	511
72.2.2 Starting up PIM-SM.....	511
<b>72.3 CONFIGURING TTL THRESHOLD .....</b>	<b>511</b>
<b>72.4 CONFIGURING IP MULTICAST BOUNDARY.....</b>	<b>512</b>
<b>72.5 CONFIGURING IP MULTICAST HELPER .....</b>	<b>512</b>
<b>72.6 CONFIGURING STUB MULTICAST ROUTE .....</b>	<b>513</b>
<b>72.7 MONITORING AND MAINTAINING MULTICAST ROUTE.....</b>	<b>514</b>
<b>CHAPTER 73 IGMP CONFIGURATION .....</b>	<b>517</b>
<b>73.1 IGMP OVERVIEW.....</b>	<b>517</b>
<b>73.2 IGMP CONFIGURATION .....</b>	<b>517</b>
<b>73.3 CHANGING CURRENT IGMP VERSION.....</b>	<b>517</b>
73.3.1 Configuring IGMP Query Interval .....	518
73.3.2 Configuring IGMP Querier Interval.....	518
73.3.3 Configuring Maximum IGMP Response Time.....	518
73.3.4 Configuring IGMP Query Interval for the Last Group Member .....	519
73.3.5 Static IGMP Configuration.....	519
73.3.6 Configuring the IGMP Immediate-leave List .....	520
<b>73.4 IGMP CHARACTERISTIC CONFIGURATION EXAMPLE.....</b>	<b>520</b>
<b>CHAPTER 74 PIM-DM CONFIGURATION .....</b>	<b>528</b>
<b>74.1 PIM-DM INTRODUCTION .....</b>	<b>528</b>

<b>74.2 CONFIGURING PIM-DM</b> .....	<b>529</b>
74.2.1 Modifying Timer.....	529
74.2.2 Designating the Version Number.....	529
74.2.3 Configuring State-Refresh.....	529
74.2.4 Configuring Filtration List.....	529
74.2.5 Setting DR Priority.....	530
74.2.6 Clearing Item (S,G).....	530
<b>74.3 PIM-DM STATE-REFRESH CONFIGURATION EXAMPLE</b> .....	<b>530</b>
<b>CHAPTER 75 CONFIGURING PIM-SM</b> .....	<b>531</b>
<b>75.1 PIM-SM INTRODUCTION</b> .....	<b>531</b>
<b>75.2 CONFIGURING PIM-SM</b> .....	<b>532</b>
75.2.1 Enabling Global Multicast.....	532
75.2.2 Starting up PIM-SM.....	532
75.2.3 Configuring Neighbor Filter List.....	532
75.2.4 DR Election.....	533
75.2.5 Configuring Candidate RP.....	534
75.2.6 Configuring Candidate BSR.....	534
75.2.7 Configuring SPT-threshold.....	534
75.2.8 Configuring SSM.....	534
75.2.9 Configuring Management Domain sz.....	535
75.2.10 Configuring Source Address of Registered Packets.....	536
75.2.11 Configuring anycast-rp.....	536
75.2.12 Displaying PIM-SM Multicast Route.....	536
75.2.13 Clearing Multicast Routes Learned by PIM-SM.....	537
<b>75.3 CONFIGURATION EXAMPLE</b> .....	<b>537</b>
75.3.1 PIM-SM Configuration Example (The switch is configured on the VLAN port).....	537
75.3.2 BSR Configuration Example (The switch is configured on the VLAN port).....	538
<b>CHAPTER 76 IPV6 PROTOCOL'S CONFIGURATION</b> .....	<b>539</b>
<b>76.1 IPV6 PROTOCOL'S CONFIGURATION</b> .....	<b>539</b>
<b>76.2 ENABLING IPV6</b> .....	<b>539</b>
76.2.1 Setting the IPv6 Address.....	539
<b>CHAPTER 77 SETTING THE IPV6 SERVICES</b> .....	<b>541</b>
<b>77.1 SETTING THE IPV6 SERVICES</b> .....	<b>541</b>
77.1.1 Managing the IPv6 Link.....	541
<b>CHAPTER 78 CONFIGURING THE ROUTING MANAGEMENT MODULES</b> .....	<b>544</b>
<b>78.1 OVERVIEW</b> .....	<b>544</b>
<b>78.2 CONFIGURATION TASK LIST OF ROUTING MANAGEMENT MODULE</b> .....	<b>545</b>
<b>78.3 ROUTING MANAGEMENT MODULE'S CONFIGURATION TASKS</b> .....	<b>546</b>

78.3.1 Setting the Static Route .....	546
78.3.2 Setting the Threshold of Routes in a Routing Table .....	546
78.3.3 Monitoring and Maintaining the State of the Routing Table .....	547
<b>78.4 STATIC ROUTE'S CONFIGURATION EXAMPLE .....</b>	<b>549</b>
<b>CHAPTER 79 ND CONFIGURATION .....</b>	<b>554</b>
<b>79.1 ND OVERVIEW.....</b>	<b>554</b>
<b>79.2 ADDRESS RESOLUTION .....</b>	<b>554</b>
<b>79.3 ND CONFIGURATION .....</b>	<b>555</b>
<b>CHAPTER 80 OSPFV3 CONFIGURATION .....</b>	<b>558</b>
<b>80.1 OVERVIEW.....</b>	<b>558</b>
<b>80.2 OSPFV3 CONFIGURATION TASK LIST.....</b>	<b>558</b>
<b>80.3 OSPFV3 CONFIGURATION TASKS .....</b>	<b>559</b>
80.3.1 Enabling OSPFv3.....	559
80.3.2 Setting the Parameters of the OSPFv3 Interface .....	559
80.3.3 Setting OSPFv3 on Different Physical Networks .....	560
80.3.4 Setting the OSPF Network Type .....	560
80.3.5 Setting the Parameters of the OSPFv3 Domain .....	560
80.3.6 Setting the Route Summary in the OSPFv3 Domain.....	561
80.3.7 Setting the Summary of the Forwarded Routes.....	561
80.3.8 Generating a Default Route .....	561
80.3.9 Choosing the Route ID on the Loopback Interface.....	561
80.3.10 Setting the Management Distance of OSPFv3 .....	562
80.3.11 Setting the Timer of Routing Algorithm.....	562
80.3.12 Monitoring and Maintaining OSPFv3 .....	562
<b>80.4 OSPFV3 CONFIGURATION EXAMPLE .....</b>	<b>563</b>
80.4.1 Example for OSPFv3 Route Learning Settings .....	563
<b>CHAPTER 81 OVERVIEW .....</b>	<b>573</b>
<b>81.1 STIPULATION .....</b>	<b>573</b>
81.1.1 Format Stipulation in the Command Line.....	573
<b>CHAPTER 82 NTP CONFIGURATION .....</b>	<b>574</b>
<b>82.1 OVERVIEW.....</b>	<b>574</b>
<b>82.2 NTP CONFIGURATION .....</b>	<b>574</b>
82.2.1 Configuring the Equipment As an NTP Server.....	574
82.2.2 Configuring NTP Authentication Function .....	574
82.2.3 Configuring NTP Association .....	574
<b>CHAPTER 83 IPV6 ACL CONFIGURATION.....</b>	<b>576</b>
<b>83.1 IPV6 ACL CONFIGURATION.....</b>	<b>576</b>

83.1.1 Filtering IPv6 Packets .....	576
83.1.2 Setting up IPv6 ACL .....	576
83.1.3 Applying ACL to the Ports .....	577
83.1.4 Examples of IPv6 ACL .....	577
<b>CHAPTER 84 CONFIGURING TIME RANGE.....</b>	<b>578</b>
<b>84.1 TIME RANGE INTRODUCTION .....</b>	<b>578</b>
84.1.1 Overview .....	578
84.1.2 Absolute Time Range .....	578
84.1.3 Periodic Time Range.....	578
84.1.4 Isolating Time Range .....	578
84.1.5 From-to Time Range .....	578
84.1.6 Activating Time Range .....	579
<b>84.2 TIME RANGE CONFIGURATION TASK LIST .....</b>	<b>579</b>
<b>84.3 TIME RANGE CONFIGURATION TASK .....</b>	<b>579</b>
84.3.1 Adding/Deleting Time Range .....	579
84.3.2 Adding/Deleting Absolute Time Range.....	580
84.3.3 Adding/Deleting Periodic Time Range .....	580
84.3.4 Applying Time Range .....	581
84.3.5 Monitoring the configuration and state of Time Range .....	581
<b>84.4 CONFIGURATION EXAMPLE.....</b>	<b>582</b>

# Chapter 1 INTRODUCTION

Thank you for purchasing PLANET Layer 3 24-/48-Port 10G SFP+ plus 4-Port 100G QSFP28 Managed Switch. The descriptions of these models are shown below:

<b>XGS-6350-24X4C</b>	Layer 3 24-Port 10G SFP+ + 4-Port 100G QSFP28 Managed Switch
	Layer 3 48-Port 10G SFP+ + 2-Port 40G QSFP+ + 4-Port 100G QSFP28 Managed Switch

## 1.1 Packet Contents

Unless specified, “**Managed Switch**” mentioned in this users manual refers to the XGS-6350-24X4C/XGS-6350-48X2Q4C.

Open the box of the Managed Switch and carefully unpack it. The box should contain the following items:

	XGS-6350-24X4C	XGS-6350-48X2Q4C
Quick Installation Guide	■	■
DB9 to RJ45 Interface RS232 Console Cable	■	■
Rack Mount Accessory Kit	■	■
AC Power Cord	■	■
SFP Dust Cap	28	54

If any item is found missing or damaged, please contact your local reseller for replacement.

## 1.2 Product Description

### Powerful 100Gbps Solution for All Long-Reach Networks

PLANET XGS-6350-Series is a High-performance Layer 3 Managed Switch that meets the next-generation Metro, Data Center, Campus and Enterprise network requirements.

The administrator can flexibly choose the suitable transceivers according to the transmission distance or the transmission speed required to extend the **1G/10G/40G/100G** network efficiently. Besides, with **high** switching capacity, the XGS-6350-Series can handle extremely large amounts of data in a secure topology linking to backbone or high capacity servers where audio, video streaming and multicast applications are utilized.

### Extractive Power Supply Design to Increase Flexibility

The XGS-6350-Series is equipped with one extractive 100~240V AC power supply unit, so it is easy to replace the power for users. Besides, the XGS-6350-Series reserves another backup power slot on the rear panel where the second AC or DC power can be added to make it a redundant power supply. The redundant power system is specifically designed to handle the demands of high-tech facilities requiring the highest power integrity.

### Rich Multi-layer Networking Protocols

The XGS-6350-Series comes with the complete Layer 3 managed function with comprehensive protocols and applications to facilitate the rapid service deployment and management for both the traditional L2 and L3 networks. With support for advanced features, including **RIP, RIPng, OSPFv2, OSPFv3, BGP, BGP4+**, etc., this switch is ideal for the traditional or fully-virtualized data center.

### Strong Multicast

The XGS-6350-Series supports abundant multicast features. In Layer 2, it features IPv4 IGMPv1/v2/v3 snooping and IPv6 MLD v1/v2 snooping. With Multicast VLAN Registration (MVR), multicast receiver/sender control and illegal multicast source detection functions can be had. In Layer 3 multicast protocols, it features **PIM-DM, PIM-SM** and **PIM-SSM** which make the XGS-6350-Series great for any robust networking.

### Full IPv6 Support

The XGS-6350-Series supports IPv4-to-IPv6 technologies including **IPv4 manual/automatic tunnel, IPv6-to-IPv4 tunnel**, and Intra-Site Automatic Tunnel Addressing Protocol (**ISATAP**) tunnel. It comprehensively supports IPv6 Neighbor Discovery, DHCPv6, Path MTU Discovery, IPv6-based Telnet, SSH and ACL, meeting the need of IPv6 network device management and service control.

## High Reliability

The key components of the XGS-6350-Series are management module, power system and the fan system that support redundancy design. All system modules support hot-swap and seamless switching without manual intervention.

It supports In-service Software Upgrade (**ISSU**) and Graceful Restart (**GR**) for OSPF/BGP routing protocol, guaranteeing non-stop user data transmission when the system is upgraded. It supports Bidirectional Forwarding Detection (**BFD**) that realizes fault detection and service recovery in seconds through linking with Layer 2 or Layer 3 protocol.

## Excellent and Secure Traffic Control

The XGS-6350-Series is loaded with powerful traffic management and WRR features to enhance services offered by telecoms and enterprises. The **WRR** functionalities include wire-speed Layer 4 traffic classifiers and bandwidth limitation which are particularly useful for multi-tenant unit, multi-business unit, Telco, or network service applications.

## Powerful Security from Layer 2 to Layer 4

The ACL policies supported can classify the traffic by source/destination IP addresses, source/destination MAC addresses, IP protocols, TCP/UDP, IP precedence, time ranges and ToS. Moreover, various policies can be conducted to forward the traffic. The XGS-6350-Series also provides IEEE 802.1x port-based access authentication, which can be deployed with RADIUS, to ensure the port level security and block illegal users. Thus, the XGS-6350-Series empowers enterprises and campuses to take full advantage of the limited network resources and guarantees the best performance in VoIP and video conferencing transmissions.

## Robust Layer 2 Features

The XGS-6350-Series can be programmed for basic switch management functions such as port speed configuration, port aggregation, VLAN, Spanning Tree Protocol, WRR, bandwidth control and IGMP snooping. It also supports 802.1Q tagged VLAN, Q-in-Q, voice VLAN and GVRP Protocol. In addition, the number of VLAN interfaces is 1K and the number of VLAN IDs is 4K. By supporting port aggregation, the XGS-6350-Series allows the operation of a high-speed trunk combined with multiple ports, making it an LACP link aggregation.

## Efficient and Secure Management

For efficient management, the XGS-6350-Series Managed 100Gigabit Switch is equipped with console, Web and SNMP management interfaces.

- With its built-in Web-based management interface, the XGS-6350-Series offers an easy-to-use, platform-independent management and configuration facility.
- The XGS-6350-Series supports standard Simple Network Management Protocol (SNMP) and can be managed via any standard-based management software.

- For reducing product learning time, the XGS-6350-Series offers Cisco-like command via Telnet or console port. Moreover, the XGS-6350-Series offers secure remote management by supporting SSH connection which encrypts the packet content at each session.

### **Centralized Hardware Stacking Management**

The XGS-6350-Series can be used to build a virtually logical facility. The XGS-6350-Series gives the enterprises, service providers and telecoms flexible control over port density, uplinks and switch stack performance. The XGS-6350-Series can connect as a ring for redundancy and ensures that data integrity is retained even if one switch in the stack fails. You can even hot-swap switches without disrupting the network, which greatly simplifies the tasks of upgrading the LAN for catering to increasing bandwidth demands.

### **Flexibility and Extension Solution**

The XGS-6350-Series provides 24/48 10Gbps SFP+, 40Gbps QSFP+ and 100Gbps QSFP28 Fiber interfaces. Each of the SFP+ slots support **Dual Speed, 10GBASE-SR/LR or 100GBASE-SX/LX** and each of the QSFP28 slots supports native **100 Gigabit Ethernet, 40G and 4 x 10 Gigabit Ethernet modes**. Therefore, the administrator can flexibly choose the suitable SFP transceiver according to not only the transmission distance, but also the transmission speed required. The distance can be extended from 550 meters to 2km (multi-mode fiber) or up to 10/20/30/40/50/70/120 km (single-mode fiber or WDM fiber). They are well suited for applications within the enterprise data centers and distributions.

### **Redundant Ring, Fast Recovery for Critical Network Applications**

The XGS-6350-Series supports redundant ring technology and features strong, rapid self-recovery capability to prevent interruptions and external intrusions. It incorporates advanced ITU-T **G.8032 ERPS** (Ethernet Ring Protection Switching) technology and Spanning Tree Protocol (802.1s MSTP) into customer's network to enhance system reliability and uptime in harsh environments. In a certain simple Ring network, the recovery time could be less than 50ms to quickly bring the network back to normal operation.

## 1.3 Product Features

### XGS-6350-24XC

- 24 10GBASE-SR/LR SFP+ slots, compatible with 1000BASE-SX/LX/BX SFP
- 4 QSFP28 slots with each supporting native 100 Gigabit Ethernet, 40G and 4 x 10 Gigabit Ethernet modes
- RJ45 to DB9 console interface for switch basic management and setup
- MNG port for HTTP server access
- USB port

### XGS-6350-48X2Q4C

- 48 10GBASE-SR/LR SFP+ slots, compatible with 1000BASE-SX/LX/BX SFP
- 2 QSFP+ slots with each supporting 40G and 4 x 10 Gigabit Ethernet modes
- 4 QSFP28 slots with each supporting native 100 Gigabit Ethernet, 40G and 4 x 10 Gigabit Ethernet modes
- RJ45 to DB9 console interface for switch basic management and setup
- MNG port for HTTP server access
- USB port

#### ➤ IPv4 Features

- Static Routing, RIP v1/v2, OSPF and BGP
- Policy Routing
- BFD for OSPF and BGP

#### ➤ IPv6 Features

- ICMPv6, DHCPv6, ACLv6, IPv6 Telnet
- IPv6 Neighbor Discovery
- Path MTU Discovery
- MLD and MLD Snooping
- IPv6 Static Routing, RIPng, OSFpv3 and BGP4+
- Manual Tunnel, ISATAP Tunnel and 6-to-4 Tunnel

#### ➤ Multicast Routing Features

- Supports Multicast Routing Protocols:
  - PIM-DM (Protocol Independent Multicast - Dense Mode)
  - PIM-SM (Protocol Independent Multicast - Sparse Mode)
  - PIM-SSM (Protocol Independent Multicast - Source-Specific Multicast Mode)
- Supports IGMP v1/v2/v3

#### ➤ Layer 2 Features

- Supports VLAN
  - IEEE 802.1Q tag-based VLAN
  - Provider Bridging (VLAN Q-in-Q, IEEE 802.1ad) supported
  - GVRP for dynamic VLAN management
  - Private VLAN
- Supports Link Aggregation

- 802.3ad Link Aggregation Control Protocol (LACP)
- Cisco ether-channel (static trunk)
- Supports Spanning Tree Protocol
  - STP, IEEE 802.1D (Classic Spanning Tree Protocol)
  - RSTP, IEEE 802.1w (Rapid Spanning Tree Protocol)
  - MSTP, IEEE 802.1s (Multiple Spanning Tree Protocol, spanning tree by VLAN)
- Port mirroring to monitor the incoming or outgoing traffic on a particular port (many to 1)
- Loop protection to avoid broadcast loops
- Link Layer Discovery Protocol (LLDP)
- Ethernet OAM 802.3ah/802.1ag/ITU-Y.1731
- Supports G.8032 ERPS (Ethernet Ring Protection Switching)

#### ➤ **Quality of Service**

- Ingress shaper and egress rate limit per port bandwidth control
- 8 priority queues on all switch ports
  - IEEE 802.1p CoS/DSCP/Precedence
  - VLAN ID
  - Policy-based ingress and egress QoS

#### ➤ **Multicast**

- Supports IPv4 IGMP snooping v1, v2 and v3
- Supports IPv6 MLD snooping v1 and v2
- Querier mode support
- MVR (Multicast VLAN Registration)

#### ➤ **Security**

- Authentication
  - IEEE 802.1x port-based network access authentication
  - Built-in RADIUS client to cooperate with the RADIUS servers
  - RADIUS/TACACS+ users access authentication
- Access Control List
  - IP-based Access Control List (ACL)
  - MAC-based Access Control List (ACL)
  - Time-based ACL
- DHCP Snooping to filter distrusted DHCP messages
- Dynamic ARP Inspection discards ARP packets with invalid MAC address to IP address binding
- IP Source Guard prevents IP spoofing attacks

#### ➤ **Management**

- IPv4 and IPv6 dual stack management
- Switch Management Interfaces
  - Console and Telnet Command Line Interface
  - HTTP web switch management
  - SNMP v1 and v2c switch management
  - SSHv2, SSLv3, TLSv1.0 and SNMP v3 secure access

- SNMP Management
  - Four RMON groups (history, statistics, alarms, and events)
  - SNMP trap for interface Link Up and Link Down notification
- Built-in Trivial File Transfer Protocol (TFTP) client
- BOOTP and DHCP for IP address assignment
- System Maintenance
  - Firmware upload/download via HTTP
  - Reset button for system reboot or reset to factory default
  - Dual images
- DHCP Functions:
  - DHCP Relay
  - DHCP Option 82
  - DHCP Server
- User Privilege levels control
- Network Time Protocol (NTP), SPAN, RSPAN
- Network Diagnostic
  - SFP-DDM (Digital Diagnostic Monitor)
  - ICMP remote IP ping
- Syslog remote alarm
- System Log
- PLANET NMS System and Smart Discovery Utility for deployment management

➤ **Stacking Management**

- Virtualized multiple XGS-6350-Series switches integrated into one logical device
- Single IP address stack management, supporting up to 2 hardware units stacked together
- Stacking architecture supports redundant Ring mode

## 1.4 Product Specifications

### ➤ XGS-6350-24X4C

Product	XGS-6350-24X4C	XGS-6350-48X2Q4C
<b>Hardware Specifications</b>		
<b>QSFP28 Slots</b>	4 with each supporting native 100/40 Gigabit Ethernet and 4 x 10 Gigabit Ethernet modes	
<b>QSFP+ Slots</b>	-	2, each supports 40 Gigabit Ethernet and 4 x 10 Gigabit Ethernet modes
<b>SFP+ Slots</b>	24 10GBASE-SR/LR SFP+ interfaces Compatible with 1000BASE-SX/LX/BX SFP transceiver	48 10GBASE-SR/LR SFP+ interfaces Compatible with 1000BASE-SX/LX/BX SFP transceiver
<b>Console</b>	1 x RJ45-to-DB9 serial port (9600, 8, N, 1)	
<b>Management</b>	1 x 10/100/1000BASE-T RJ45 port	
<b>USB</b>	1 x USB 2.0	
<b>Dimensions (W x D x H)</b>	442.5 x 364 x 44 mm, 1U height	442 x 404 x 44 mm, 1U height
<b>Weight</b>	5990g	8400g
<b>Power Consumption</b>	75 watts/210 BTU (maximum)	147 watts/504.3 BTU (maximum)
<b>Power Requirements</b>	AC 100~240V, 50/60Hz	AC 100~240V, 50/60Hz DC 36~72V (Optional power module)
<b>Number of Power Supply Bays</b>		2
<b>Number of Fan Trays</b>	4 fixed	4
<b>LED</b>	System: PWR, SYS Ports: 40G/100G QSFP Port: LNK/ACT	System: PWRA, PWRB, <b>Green</b> SYS, <b>Green</b> MNG, <b>Green</b> Ports: 10G SFP+ interfaces: LNK/ACT, <b>Green</b> 40G/100G QSFP28 interfaces: LNK/ACT, <b>Green</b> 40G QSFP+ interfaces:

		LNK/ACT, <b>Green</b>
<b>Switching Specifications</b>		
<b>Switch Architecture</b>	Store-and-forward	
<b>Switch Capacity</b>	800Gbps/non-blocking	1.92Tbps/non-blocking
<b>Switch Throughput</b>	960Mpps	1440Mpps@64bytes
<b>Address Table</b>	32K MAC address table with auto learning function	64K MAC address table with auto learning function
<b>Shared Data Buffer</b>	4MB	9MB
<b>Flow Control</b>	Back pressure for half duplex IEEE 802.3x pause frame for full duplex	
<b>Jumbo Frame</b>	9KB	
<b>IPv4 Layer 3 Functions</b>		
<b>IP Routing Protocol</b>	RIP v1/v2 OSPFv2 BGP (Border Gateway Protocol) Static routing	
<b>Multicast Routing Protocol</b>	PIM-DM and PIM-SM PIM-SSM	
<b>Routing Features</b>	VRRP Policy routing Load balance through equal-cost routing BFD (Bidirectional Forwarding Detection) for OSPF and BGP	
<b>IPv6 Layer 3 Functions</b>		
<b>IP Routing Protocol</b>	RIPng OSPFv3 BGP4+	
<b>Routing Features</b>	Manual tunnel ISATAP tunnel 6-to-4 tunnel	
<b>IPv6 Functions</b>	ICMPv6, DHCPv6, ACLv6, IPv6 Telnet IPv6 Neighbor Discovery Path MTU Discovery	
<b>Layer 2 Functions</b>		
<b>Port Configuration</b>	Port disable/enable Auto-negotiation 10/100/1000Mbps full and half duplex mode selection Flow control disable/enable Bandwidth control on each port Port loopback detect	

<b>VLAN</b>	<p>IEEE 802.1Q tag-based VLAN,  IEEE 802.1ad Q-in-Q VLAN stacking/tunneling  GVRP for VLAN management  Private VLAN  Up to 4K VLAN groups</p>
<b>Spanning Tree Protocol</b>	<p>IEEE 802.1D Spanning Tree Protocol (STP)  IEEE 802.1w Rapid Spanning Tree Protocol (RSTP)  IEEE 802.1s Multiple Spanning Tree Protocol (MSTP)  BPDU protection, root protection</p>
<b>Ring</b>	<p>Supports ITU-G G.8032 ERPS</p>
<b>IPv4 IGMP Snooping</b>	<p>IPv4 IGMP v1/v2/v3 snooping  IGMP Fast Leave  IPv4 Querier mode support  IGMP Filtering and IGMP Throttling  IGMP Proxy reporting</p>
<b>IPv6 MLD Snooping</b>	<p>IPv6 MLD v1/v2 snooping  Multicast VLAN Register (MVR)</p>
<b>Bandwidth Control</b>	<p>Ingress and Egress  At least 64Kbps stream</p>
<b>Link Aggregation</b>	<p>IEEE 802.3ad LACP/static trunk  Supports 8 groups with 8 ports per trunk group</p>
<b>QoS</b>	<p>8 priority queues on all switch ports  Traffic Supervision and Traffic Shaping  Scheduling for priority queues <ul style="list-style-type: none"> <li>- Weighted Round Robin (WRR)</li> <li>- Strict priority (SP)</li> <li>- SP+WRR</li> </ul> Traffic classification: <ul style="list-style-type: none"> <li>- IEEE 802.1p CoS</li> <li>- DSCP</li> <li>- DiffServ</li> <li>- Precedence</li> <li>- TOS</li> <li>- VLAN ID</li> <li>- IP ACL</li> <li>- MAC ACL</li> </ul> Policy-based ingress and egress QoS  802.1p and DSCP priority remark</p>
	<p>IEEE 802.1x port-based network access control  AAA authentication: TACACS+ and IPv4/IPv6 over RADIUS</p>

Security Function	
<b>Access Control List</b>	<ul style="list-style-type: none"> <li>Supports Standard and Expanded ACL</li> <li>IP-based ACL/MAC-based ACL</li> <li>Time-based ACL</li> <li>Up to 1K entries</li> </ul>
<b>Security</b>	<ul style="list-style-type: none"> <li>Port isolation</li> <li>Port security, supports IP + MAC + port binding</li> <li>Identification and filtering of L2/L3/L4 based ACL</li> <li>Defend against DOS or TCP attacks</li> <li>Suppression of broadcast, multicast and unknown unicast packet</li> <li>DHCP Snooping, DHCP Option 82</li> <li>Command line authority control based on user levels</li> </ul>
<b>AAA</b>	TACACS+ and IPv4/IPv6 over RADIUS
<b>Network Access Control</b>	IEEE 802.1x port-based network access control
Management Function	
<b>System Configuration</b>	<ul style="list-style-type: none"> <li>Console and Telnet</li> <li>Web browser</li> <li>SNMP v1, v2c</li> </ul>
<b>Secure Management Interfaces</b>	<ul style="list-style-type: none"> <li>SSHv2, SSLv3 and SNMPv3</li> <li>Maximum 8 sessions for SSH and Telnet connection</li> </ul>
<b>System Management</b>	<ul style="list-style-type: none"> <li>Supports both IPv4 and IPv6 Protocols</li> <li>Supports the user IP security inspection for IPv4/IPv6 SNMP</li> <li>Supports MIB and TRAP</li> <li>Supports TFTP, FTP</li> <li>Supports IPv4/IPv6 NTP</li> <li>Supports RMON 1, 2, 3, 9 groups</li> <li>Supports the RADIUS authentication for IPv4/IPv6 Telnet user name and password</li> <li>The right configuration for users to adopt RADIUS server's shell management</li> <li>Supports Security IP safety net management function: avoid unlawful landing at non-restrictive area</li> <li>Supports TACACS+</li> <li>Supports SPAN, RSPAN</li> </ul>
<b>Event Management</b>	Supports syslog server for IPv4 and IPv6
<b>SNMP MIBs</b>	<ul style="list-style-type: none"> <li>RFC 1213 MIB-II</li> <li>RFC 1215 Internet Engineering Task Force</li> <li>RFC 1271 RMON</li> <li>RFC 1354 IP-Forwarding MIB</li> </ul>

	<p>RFC 1493 Bridge MIB</p> <p>RFC 1643 Ether-like MIB</p> <p>RFC 1907 SNMPv2</p> <p>RFC 2011 IP/ICMP MIB</p> <p>RFC 2012 TCP MIB</p> <p>RFC 2013 UDP MIB</p> <p>RFC 2096 IP forward MIB</p> <p>RFC 2233 if MIB</p> <p>RFC 2452 TCP6 MIB</p> <p>RFC 2454 UDP6 MIB</p> <p>RFC 2465 IPv6 MIB</p> <p>RFC 2466 ICMP6 MIB</p> <p>RFC 2573 SNMPv3 notification</p> <p>RFC 2574 SNMPv3 VACM</p> <p>RFC 2674 Bridge MIB Extensions</p>
<b>Standard Conformance</b>	
<b>Regulatory Compliance</b>	FCC Part 15 Class A, CE
<b>Standards Compliance</b>	<p>IEEE 802.3z Gigabit 1000BASE-SX/LX</p> <p>IEEE 802.3ae 10Gb/s Ethernet</p> <p>IEEE 802.3x flow control and back pressure</p> <p>IEEE 802.3ad port trunk with LACP</p> <p>IEEE 802.1D Spanning Tree Protocol</p> <p>IEEE 802.1w Rapid Spanning Tree Protocol</p> <p>IEEE 802.1s Multiple Spanning Tree Protocol</p> <p>IEEE 802.1p Class of Service</p> <p>IEEE 802.1Q VLAN tagging</p> <p>IEEE 802.1X port authentication network control</p> <p>IEEE 802.1ab LLDP</p> <p>RFC 768 UDP</p> <p>RFC 793 TFTP</p> <p>RFC 791 IP</p> <p>RFC 792 ICMP</p> <p>RFC 2068 HTTP</p> <p>RFC 1112 IGMP v1</p> <p>RFC 2236 IGMP v2</p> <p>RFC 3376 IGMP v3</p> <p>RFC 2710 MLD v1</p> <p>FRC 3810 MLD v2</p> <p>RFC 2328 OSPF v2</p>

	RFC 1058 RIP v1 RFC 2453 RIP v2
<b>Environment</b>	
<b>Operating</b>	Temperature: 0 ~ 50 degrees C Relative Humidity: 10 ~ 85% (non-condensing)
<b>Storage</b>	Temperature: -40 ~ 80 degrees C Relative Humidity: 5 ~ 95% (non-condensing)

# Chapter 2 Installation

This section describes the hardware features and installation of the Managed Switch on the desktop or rack mount. For easier management and control of the Managed Switch, familiarize yourself with its display indicators, and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the Managed Switch, please read this chapter completely.

## 2.1 Hardware Description

### 2.1.1 Switch Front Panel

The unit front panel provides a simple interface monitoring the switch. [Figure 2-1-1](#), [2-1-2](#), [2-1-3](#) and [2-1-4](#) show the front panel of the Managed Switches.

#### XGS-6350-24X4C Front Panel

Figure 2-1-1 XGS-6350-24X4C front panel

#### XGS-6350-48X2Q4C Front Panel

Figure 2-1-2 XGS-6350-48X2Q4C front panel

#### ■ Gigabit TP interface

10/100/1000BASE-T copper, RJ45 twisted-pair: Up to 100 meters.

#### ■ SFP/SFP+ slots

SFP/SFP+ mini-GBIC slot, SFP (Small Factor Pluggable) transceiver module: From 550 meters (Multi-mode fiber) to 10/30/50/70/120 kilometers (Single-mode fiber).

#### ■ Console Port

The console port is an RJ45 type, RS232 male serial port connector. It is an interface for connecting a terminal directly. Through the console port, it provides rich diagnostic information including IP address setting, factory reset, port management, link status and system setting. Users can use the attached RS232 cable in the package and connect to the console port on the device. After the connection, users can run any terminal emulation program (Hyper Terminal, ProComm Plus, Telix, Winterm and so on) to enter the startup screen of the device.

#### ■ USB Interface

The USB port is a USB2.0 type; it is an interface for uploading/restoring the configuration/firmware.

#### ■ MGMT Port

The MGMT port is an RJ45 type, an independent interface for Telnet or SSH.

## **2.1.2 LED Indications**

The front panel LEDs indicate instant status of port links, data activity, system operation, stack status and system power, and helps monitor and troubleshoot when needed.

# XGS-6350-24X4C

Figure 2-1-3 XGS-6350-24X4C front panel

## ■ System

LED	Color	Function
PWR	Green	Lights to indicate that the Switch has power.
	Off	Power is off.
SYS	Green	Blinks to indicate the system diagnosis is completed; lights to indicate the system is normally starting up.

## ■ Interfaces

LED	Color	Function
LNK/ACT	Green	Blinks to indicate the data is transmitting and receiving through the port; lights to indicate the link on the port is normal.

## ■ 40G Status LED (Divided into 4 10G)

LED	Color	Function
LNK/ACT (CG1~CG4)	Green	Operating in 100G mode, the LED does not light; when the QSFP+ corresponding port indicator is lit, 4 indicators indicate the LINK/ACT status of the 4 10GE ports corresponding to the QSFP+ port.

# XGS-6350-48X2Q4C

Figure 2-1-4 XGS-6350-48X2Q4C front panel

## ■ System

LED	Color	Function
PWRA	Green	Lights to indicate that the Switch has power.
PWRB	Off	Power is off.
SYS	Green	Blinks to indicate the system diagnosis is completed; lights to indicate the system is normally starting up.
MNG	Green	Lights to indicate that the Switch has connected the Ethernet cable to management port.
	Off	Lights to indicate that the Switch has not connected the Ethernet cable to management port.

## ■ Interfaces

LED	Color	Function
LNK/ACT	Green	Blinks to indicate the data is transmitting and receiving through the port; lights to indicate the link on the port is normal.

## ■ 40G BREAKOUT LED

LED	Color	Function
LNK/ACT (1~4)	Green	Operating in 100Gbps on 4 QSFP28 ports and 40Gbps on 2 QSFP+ ports, the BREAKOUT LED does not light; when you configure the interface <b>dividing into</b> 4 10G ports through configuration, the BREAKOUT LED indicators will light up.

## 2.2 Switch Installation

This section describes how to install your Managed Switch and make connections to the Managed Switch. Please read the following topics and perform the procedures in the order being presented. To install your Managed Switch on a desktop or shelf, simply complete the following steps.

### 2.2.1 Desktop Installation

To install the Managed Switch on desktop or shelf, please follow these steps:

**Step 1:** Attach the rubber feet to the recessed areas on the bottom of the Managed Switch.

**Step 2:** Place the Managed Switch on the desktop or the shelf near an AC power source, as shown in [Figure 2-2-1](#).

**Figure 2-2-1** Place the Managed Switch on the desktop

**Step 3:** Keep enough ventilation space between the Managed Switch and the surrounding objects.

---

When choosing a location, please keep in mind the environmental restrictions discussed in Chapter 1, Section 4 under **Specifications**.

---

**Step 4:** [Connect the Managed Switch to network devices.](#)

Connect one end of a standard network cable to the 10/100/1000 RJ45 ports on the front of the Managed Switch and connect the other end of the cable to the network devices such as printer servers, workstations or routers, etc.

---

Connection to the Managed Switch requires UTP Category 5 network cabling with RJ45 tips. For more information, please see the Cabling Specification in Appendix A.

---

**Step 5:** Supply power to the Managed Switch.

Connect one end of the power cable to the Managed Switch.

Connect the power plug of the power cable to a standard wall outlet.

When the Managed Switch receives power, the Power LED should remain solid Green.

## 2.2.2 Rack Mounting

To install the Managed Switch in a 19-inch standard rack, please follow the instructions described below:

**Step 1:** Place the Managed Switch on a hard flat surface, with the front panel positioned towards the front side.

**Step 2:** Attach the rack-mount bracket to each side of the Managed Switch with supplied screws attached to the package.

Figure 2-2-2 shows how to attach brackets to one side of the Managed Switch.

**Figure 2-2-2** Attach brackets to the Managed Switch.

---

You must use the screws supplied with the mounting brackets. Damage caused to the parts by using incorrect screws would invalidate the warranty.

---

**Step 3:** Secure the brackets tightly.

**Step 4:** Follow the same steps to attach the second bracket to the opposite side.

**Step 5:** After the brackets are attached to the Managed Switch, use suitable screws to securely attach the brackets to the rack, as shown in Figure 2-2-3.

**Figure 2-2-3** Mounting SGS-6341 Series in a Rack

**Step 6:** Proceed with Steps 4 and 5 of Session 2.2.1 Desktop Installation to connect the network cabling and supply power to the Managed Switch.

■ **AC Power Receptacle**

Compatible with electrical services in most areas of the world, the Managed Switch's power supply automatically adjusts to line power in the range of 100-240VAC and 50/60 Hz.

Plug the female end of the power cord firmly into the receptacle on the rear panel of the Managed Switch. Plug the other end of the power cord into an electrical outlet and then the power will be ready.

# Chapter 3 Configuration Preparation

The chapter mainly describes the following preparatory works before you configure the switch at the first time:

- Port number of the switch
- Preparation before switch startup
- How to get help
- Command mode
- Cancelling a command
- Saving configuration

## 3.1 Port Number of the Switch

The physical port of the switch is numbered in the **<type><slot>/<port>** form. The type-to-name table is shown as follows:

Interface Type	Name	Simplified Name
10M Ethernet	Ethernet	e
100M fast Ethernet	FastEthernet	f
1000M Ethernet	GigaEthernet	g

The expansion slot number to mark and set ports must be the number **0**. Other expansion slots are numbered from left to right, starting from **1**.

The ports in the same expansion slot are numbered according to the order from top to bottom and the order from left to right, starting from **1**. If only one port exists, the port number is **1**.

**Note:**

Ports in each kind of modulars must be numbered sequently from top to bottom and from left to right.

## 3.2 Preparation Before Switch Startup

Do the following preparatory works before the switch is configured:

- (1) Set the switch's hardware according to the requirements of the manual.
- (2) Configure a PC terminal simulation program.
- (3) Determine the IP address layout for the IP network protocols.

## 3.3 Acquiring Help

Use the question mark (?) and the direction mark to help you enter commands:

- Enter a question mark. The currently available command list is displayed.

Switch> ?

- Enter several familiar characters and press the space key. The available command list starting with the entered familiar characters is displayed.

Switch> s?

- Enter a command, press the space key and enter the question mark. The command parameter list is displayed.

Switch> show ?

- Press the “up” key and the commands entered before can be displayed. Continue to press the “up” key and more commands are to be displayed. After that, press the “down” key and the next command to be entered is displayed under the current command.

### 3.4 Command Modes

The command line interfaces for the switch can be classified into several modes. Each command mode enables you to configure different groupware. The command that can be used currently is up to the command mode where you are. You can enter the question mark in different command modes to obtain the available command list. Common command modes are listed in the following table:

Command Mode	Login Mode	Prompt	Exit Mode
System monitoring mode	Enter <b>Ctrl-p</b> after the power is on.	monitor#	Run <b>quit</b> .
User mode	Log in.	Switch>	Run <b>exit</b> or <b>quit</b> .
Management mode	Enter <b>enter</b> or <b>enable</b> in user mode.	Switch#	Run <b>exit</b> or <b>quit</b> .
Office configuration mode	Enter <b>config</b> in management mode.	Switch_config#	Run <b>exit</b> or <b>quit</b> or <b>Ctrl-z</b> to directly back to the management mode.
Port configuration mode	Enter the <b>interface</b> command in office configuration mode, such as <b>interface f0/1</b> .	Switch_config_f0/1#	Run <b>exit</b> or <b>quit</b> or <b>Ctrl-z</b> to directly back to the management mode.

Each command mode is unsuitable to subsets of some commands. If problem occurs when you enter commands, check the prompt and enter the question mark to obtain the available command list. Problem may occur when you run in incorrect command mode or you misspelled the command. Pay attention to the changes of the interface prompt and the relative command mode in the following case:

```
Switch> enter
Password: <enter password>
Switch# config
Switch_config# interface f0/1
Switch_config_f0/1# quit
Switch_config# quit
Switch#
```

### **3.5 Canceling a Command**

To cancel a command or resume its default properties, add the keyword “no” before most commands. An example is given as follows:

**no ip routing**

### **3.6 Saving Configuration**

You need to save configuration in case the system is restarted or the power is suddenly off. Saving configuration can quickly recover the original configuration. You can run write to save configuration in management mode or office configuration mode.

# Chapter 4 System Management Configuration

## 4.1 File Management Configuration

### 4.1.1 Managing the file system

The filename in flash is no more than 20 characters and filenames are case insensitive.

GP3616 SWITCH is mainly consisted of MSU. As MSU needs IOS, download BIN file to MSU. Ensure the suffix of the BIN file is .bin. The BIN file name can be arbitrary.

In GP3616 file system, IOS file with the suffix .bin is used for MSU startup. The file name is arbitrary. BOOTROM will select a bin startup automatically based on the sequence. tiger.blob file is applied on the PON program of GP3616 board card. startup-config is the system configuration file; config.db is the ONU configuration database file; and if index-config is the port mapping configuration file.

### 4.1.2 Commands for the file system

The boldfaces in all commands are keywords. Others are parameters. The content in the square bracket “[ ]” is optional.

Command	Purpose
<b>format</b>	Formats the file system and delete all data.
<b>dir</b> [filename]	Displays files and directory names. The file name in the symbol “[ ]” means to display files starting with several letters. The file is displayed in the following format: Index number file name <FILE> length established time
<b>delete</b> filename	Deletes a file. The system will prompt if the file does not exist.
<b>md</b> dirname	Creates a directory.
<b>rd</b> dirname	Deletes a directory. The system will prompt if the directory is not existed.
<b>more</b> filename	Displays the content of a file. If the file content cannot be displayed by one page, it will be displayed by pages.
<b>cd</b>	Changes the path of the current file system.
<b>pwd</b>	Displays the current path.

### 4.1.3 Starting up from a file manually

```
monitor#boot flash <local_filename>
```

The command is to start an SWITCH software in the flash, which may contain multiple SWITCH softwares.

Description

<b>Parameters</b>	<b>Description</b>
<i>local_filename</i>	file name in the flash, the user must enter the file name

## Example

```
monitor#boot flash switch.bin
```

### 4.1.4 Updating software

User can use this command to download SWITCH system software locally or remotely to obtain version update or the custom-made function version.

There are two ways of software update in monitor mode.

## Through TFTP protocol

```
monitor#copy tftp flash [ip_addr]
```

The command is to copy file from the tftp server to the flash in the system. After you enter the command, the system will prompt you to enter the remote server name and the remote filename.

Description

<b>Parameters</b>	<b>Description</b>
ip_addr	Means the IP address of the TFTP server. If this parameter is not designated, you are prompted to enter the IP address after the copy command is run.

## Example

The following example shows a main.bin file is read from the server, written into the SWITCH and changed into the name switch. Bin.

```
monitor#copy tftp flash
```

```
Prompt: Source file name[]?main.bin
```

```
Prompt: Remote-server ip address[]?192.168.20.1
```

```
Prompt: Destination file name[main.bin]?switch.bin
```

```
please wait ...
```

```
#####  
#####  
#####  
#####  
#####  
#####
```

```
TFTP:successfully receive 3377 blocks ,1728902 bytes
```

```
monitor#
```

## 4.1.5 Updating configuration

The SWITCH configuration is saved as a file, the filename is startup-config. You can use commands similar to software update to update the configuration.

## Through TFTP protocol

```
monitor#copy tftp flash startup-config
```

### 4.1.6 Using ftp to perform the update of software and configuration

```
switch #copy ftp flash [ip_addr]
```

Use ftp to perform the update of software and configuration in formal program management. Use the copy command to download a file from ftp server to SWITCH, also to upload a file from file system of the SWITCH to ftp server. After you enter the command, the system will prompt you to enter the remote server name and remote filename.

```
copy{ftp:[[//login-name:[login-  
password]@]location]/directory]/filename)}flash:filename>}{flash<:filename>ftp:[[//login-name:[login-  
password]@]location]/directory]/filename}<blksize><mode><type>
```

## Description

Parameters	Description
login-nam	Username of the ftp server If this parameter is not designated, you are prompted to enter the IP address after the copy command is run.
login-password	Password of the ftp server If this parameter is not designated, you are prompted to enter the IP address after the copy command is run.
ip_addr	IP address of the ftp server If this parameter is not designated, you are prompted to enter the IP address after the copy command is run.
active	Means to connect the ftp server in active mode.
passive	Means to connect the ftp server in passive mode.
type	Set the data transmission mode (ascii or binary)

## Example

The following example shows a main.bin file is read from the server, written into the SWITCH and changed into the name switch.bin.

```
switch#copy ftp flash
```

```
Prompt:ftp user name[anonymous]? login-nam
```

```
Prompt:ftp user password[anonymous]? login-password
```

```
Prompt:Source file name[]?main.bin
```

```
Prompt:Remote-server ip address[]?192.168.20.1
```

```
Prompt:Destination file name[main.bin]?switch.bin
```

Or

```
switch#copy ftp://login-nam:login-password@192.168.20.1/main.bin flash:switch.bin
#####
#####
FTP:successfully receive 3377 blocks ,1728902 bytes
switch#
```

### Note:

- 1) When the ftp server is out of service, the wait time is long. If this problem is caused by the tcp timeout time (the default value is 75s), you can configure the global command ip tcp synwait-time to modify the tcp connection time. However, it is not recommended to use it.
- 2) When you use ftp in some networking conditions, the rate of data transmission might be relatively slow. You can properly adjust the size of the transmission block to obtain the best effect. The default size is 512 characters, which guarantee a relatively high operation rate in most of the networks.

## 4.2 Basic System Management Configuration

### 4.2.1 Configuring Ethernet IP Address

```
monitor#ip address <ip_addr> <net_mask>
```

This command is to configure the IP address of the Ethernet.,The default IP address is 192.168.0. 1,and the network mask is255.255.255.0.

Description

<b>Parameters</b>	<b>Description</b>
<i>ip_addr</i>	IP address of the Ethernet
<i>net_mask</i>	Mask of the Ethernet

## Example

```
monitor#ip address 192.168.1.1 255.255.255.0
```

### 4.2.2 Setting the Default Route

```
monitor#ip route default <ip_addr>
```

This command is used to configure the default route. You can configure only one default route.

Description

Parameters	Description
<i>ip_addr</i>	IP address of the gateway

## Example

```
monitor#ip route default 192.168.1.1
```

### 4.2.3 Using Ping to Test Network Connection State

```
monitor#ping <ip_address>
```

This command is to test network connection state.

## Description

<b>Parameters</b>	<b>Description</b>
<i>ip_address</i>	Stands for the destination IP address

## Example

```
monitor#ping 192.168.20.100
PING 192.168.20.100: 56 data bytes
64 bytes from 192.168.20.100: icmp_seq=0. time=0. ms
64 bytes from 192.168.20.100: icmp_seq=1. time=0. ms
64 bytes from 192.168.20.100: icmp_seq=2. time=0. ms
64 bytes from 192.168.20.100: icmp_seq=3. time=0. ms
----192.168.20.100 PING Statistics----
4 packets transmitted, 4 packets received, 0% packet loss
round-trip (ms)  min/avg/max = 0/0/0
```

# Chapter 5 Terminal Configuration

## 5.1 VTY Configuration Overview

The system uses the line command to configure terminal parameters. Through the command, you can configure the width and height that the terminal displays.

## 5.2 Configuration Tasks

The system has four types of lines: console, aid, asynchronous and virtual terminal. Different systems have different numbers of lines of these types. Refer to the following software and hardware configuration guide for the proper configuration.

Line Type	Interface	Description	Numbering
CON(CTY)	Console	To log in to the system for configuration.	0
VTY	Virtual and asynchronous	To connect Telnet, X.25 PAD, HTTP and Rlogin of synchronous ports (such as Ethernet and serial port) on the system	32 numbers starting from 1

### 5.2.1 Relationship between Line and Interface

## Relationship between Synchronous Interface and VTY Line

The virtual terminal line provides a synchronous interface to access to the system. When you connect to the system through VTY line, you actually connects to a virtual port on an interface. For each synchronous interface, there can be many virtual ports.

For example, if several Telnets are connecting to an interface (Ethernet or serial interface).

Steps for configuring VTY:

- (1) Log in to the line configuration mode.
- (2) Configure the terminal parameters.

Note: The serial port terminal and telnet terminal may log out the system if they log on to SWITCH without any operation within a certain time. The timeout can be configured.

For VTY configuration, refer to the section “VTY configuration example”.

### 5.3 Monitor and Maintenance

Run `show line` to check the VTY configuration.

### 5.4 Browsing Logs

By default, the system will export the logs to the console port.

After the terminal monitor command is set on the telnet line, the logs will be exported to this line.

By default the logs will not be exported to the cache and cannot be browsed after you run `show log`. After you run `logging buffer size` to set the log cache, you can run `show log` to browse the log information.

### 5.5 VTY Configuration Example

It shows how to cancel the limit of the line number per screen for all VTYs without more prompt:

```
config#line vty 0 32
config_line#length 0

32 vty configuration timeout time
Switch_config#line vty 0 31
Switch_config_line#exec-timeout 10
Switch_config_line#exit
Switch_config#
```

# Chapter 6 SSH Configuration Commands

## 6.1 Ssh Overview

### 6.1.1 SSH Server

SSH client can provide a secure and encrypted communication link through SSH server and other devices. This connection has the same functions as those of Telnet. SSH server supports the following encryption algorithms: des, 3des and blowfish.

### 6.1.2 SSH Client

SSH client runs on the basis of the SSH protocol, providing authentication and encryption. Due to the application of authentication and encryption, SSH client ssh client allows to establish secure communication in unsecure network environment between our's communication devices or between other devices that support ssh server. SSH client supports the following encryption algorithms: des, 3des and blowfish.

### 6.1.3 Attribute Realization

SSH server and SSH client support SSH 1.5. Both of them supports the shell application.

## 6.2 Configuration Tasks

### 6.2.1 Configuring the Authentication Method List

SSH server adopts the login authentication mode. SSH server uses the default authentication method list by default.

In global configuration mode, the following command can be used to configure the authentication method list.

Command	Purpose
ip sshd auth-method STRING	Configure the authentication method list. The length of the authentication method's name is no more than 20 characters.

### 6.2.2 Configuring Access List

In order to control SSH server to access other devices, you can configure ACL for SSH server.

In global configuration mode, the following command can be used to configure the timeout time.

Command	Purpose
ip sshd access-class STRING	Configures ACL. The length of the access list's name is no more than 19 characters.

### 6.2.3 Configuring the Authentication Timeout Time

After SSH client connects SSH server successfully, the SSH server will close the connection if the authentication cannot be passed during the configured time.

In global configuration mode, the following command can be used to configure the authentication timeout.

Command	Purpose
ip sshd timeout <60-65535>	Configure the authentication timeout time.

## 6.2.4 Configuring the Authentication Retry Times

If the times for failed authentications exceed the maximum times, SSH server will not allow you to retry authentication and the system enters the silent period. The maximum times for retrying authentication is 6 by default.

In global configuration mode, the following command can be used to configure the authentication retry times.

Command	Purpose
ip sshd auth-retries <0-65535>	Configures the authentication retry times.

## 6.2.5 Configuring the Login Silence Period

The system enters in the silent period when the authentication retry times exceed the threshold. The silence period is 60s by default.

In global configuration mode, the following command can be used to configure the silence period.

Command	Purpose
ip sshd silence-period <0-3600>	Configures the login silence period

## 6.2.6 Enabling Encryption Key Saving Function

Enable ssh server and the initial encryption key needs to be calculated. The process may take one to two minutes. When enabling the encryption key saving function, the initial encryption key is saved in the flash. When enabling ssh server in a second time, the encryption key will be read first.

sftp function is disabled by default. Use the following command to enable sftp function in global configuration mode:

Command	Purpose
ip sshd save	Enable encryption key saving function.

## 6.2.7 Enabling SFTP Function

The SFTP function refers to the secure file transmission system based on SSH, of which the authentication procedure and data transmission are encrypted. Though it has low transmission efficiency, network security is highly improved.

SFTP function is disabled by default. Run following command to enable SFTP function in global configuration mode.

Command	Purpose
ip sshd sftp	Enable sftp function.

## 6.2.8 Enabling SSH Server

Ssh server is disabled by default. WHEN SSH server is enabled, a RSA key pair will be generated and then listens the connection request from SSH client. The whole process probably requires one or two minutes.

The following command can be used in global configuration mode to enable SSH server:

Command	Purpose
ip sshd enable	Enable SSH server. The digit of the password is 1024.

## 6.3 Configuration Example of SSH Server

The following configuration allows the host whose IP is 192.168.20.40 to access SSH server, while the local user database will be used to authenticate the user.

### 6.3.1 ACL

```
ip access-list standard ssh-acl
permit 192.168.20.40
```

### 6.3.2 Global Configuration

```
aaa authentication login ssh-auth local
ip sshd auth-method ssh-auth
ip sshd access-class ssh-acl
```

```
ip sshd enable
```

# Chapter 7 Network Management Configuration

## 7.1 SNMP Configuration

### 7.1.1 Overview

The SNMP system includes the following 3 parts:

- SNMP management server (NMS)
- SNMP agent (agent)
- MIB

SNMP is a protocol for the application layer. It provides the format for the packets which are transmitted between NMS and agent.

SNMP management server is a part of the network management system, such as CiscoWorks.

SNMP agent includes the MIB variable and the SNMP management server can be used to browse or change these variables' values. The management server can get the values from the agent or save these variables in the agent. The agent collects data from MIB. MIB is the database of equipment parameters and network data.

## SNMP Notification

When a special event occurs, the system will send an inform to the SNMP management server. For example, when the agent system runs into an incorrect condition, it will send a message to the management server.

The SNMP notification can be sent as a trap or an inform request. Because the receiver receives a trap and does not send any response, the transmitter hence cannot confirm whether the trap is received. In this way, the trap is unreliable. Comparatively, the SNMP management server uses SNMP to respond PDU, which is acted as a response of this message. If the management server does not receive the inform request, it will not transmit a response. If the transmitter does not receive the response, it will transmit the inform request again. In this way, the inform has more chance to arrive the planned destination.

### 7.2 SNMP Tasks

- Configuring idle time value
- Configuring the time value of waiting for acknowledgement
- Configuring busy time value of remote end
- Configuring time value of Response
- Configuring the time of reject
- Configuring the redial times
- Configuring the size of window for resend
- Configuring the size of accumulated data packet
- Setting the acknowledgement time-delay
- Setting the maximum numbers of acknowledgement
- Showing LLC2 link information
- Debugging LLC2 link information

### 7.3 LLC2 Configuration Task

#### 7.3.1 Configuring Idle Time Value

The command is used for controlling the frequency of query at the idle time (no data exchanged)

The command "no" can be used for restoring to the default value.

Command	Purpose
[no] llc2 idle-time [seconds]	Used for controlling the frequency of query at the idle time (no data exchanged). seconds: The interval seconds of sending RR frame at the idle time. The maximum is 60 seconds, the minimum is 1 second, and the default is 10 seconds.

Configuration mode: Interface Configuration

#### Notes:

At idle time, no I (information) frame is exchanged and RR (receive ready) frame is sent to the remote end periodically to tell the remote end that the local end is ready to receive data. The relative small value should be set for ensuring the prompt advice to the remote end. If the value is set too small, too many RR frames is likely to be sent on the network.

Example: Setting RR frame sent every 12 seconds

```
int ethernet1/1
llc2 idle-time 12
```

### 7.3.2 Configuring the Time Value of Waiting for Acknowledgement

Command	Purpose
[no] llc2 t1-time [seconds]	Used for controlling the waiting time of expecting remote acknowledgement. The command “no” can be used for restoring to the default value. Seconds The seconds of waiting for remote acknowledgement. The maximum is 60 seconds, the minimum is 1 second and the default is 1 second.

Configuration mode: Interface configuration

**Notes:**

When the local end sends I frame, it will wait for remote acknowledgement. If no acknowledgement is received within a given time, the I-frame will be resent. The relative big value should be set on the network where the data is transmitted at a slow rate.

Example: Setting 12 seconds as the time value of waiting for acknowledgement.

```
int ethernet1/1
llc2 t1-time 12
```

### 7.3.3 Configuring Busy Time Value of Remote Terminal

Command	Purpose
[no] llc2 tbusy-time [seconds]	Used for controlling the waiting time when the remote end is busy. The command “no” can be used for restoring to the default value. Seconds The waiting seconds when the remote end is busy. The maximum is 60 seconds, the minimum is 1 second and the default is 10 seconds.

Configuration mode: Interface configuration

**Notes:**

a LLC2 connective end is able to inform the opposite end that local end is busy and prevent the opposite end from sending data to local end by sending a RNR (receive not ready) The relative big value can be set for averting the timeout.

Example: Setting 12 seconds as the busy time value of remote end.

```
int ethernet1/1
llc2 tbusy-time 12
```

### 7.3.4 Configuring Time Value of Response

The command is used for controlling the time of waiting for the response of remote end. The command “no” can be used for restoring to the default value.

Command	Purpose
[no] llc2 tpf-time [seconds]	used for controlling the time of waiting for the response of remote end. The command “no” can be used for restoring to the default value. Seconds :The seconds of waiting for the response of remote end. The maximum is 60 seconds, the minimum is 1 second, and the default is 1 second.

Configuration Mode: Interface Configuration

**Notes:**

A LLC2 connective end sometimes needs to know the status of opposite end. For this purpose, a command frame that requires a response from the opposite end needs to be sent. When the opposite end receives the command frame, it will reply a response frame. If the error occurs in the process, the send end will keep waiting. In order to avoid the situation, a clock needs to be enabled. When the arrival time is hit, the clock will think that the error occurs and it will send a separate command frame. The command is used for setting the time of waiting for the response of the opposite end to the command frame.

Example: Setting 12 seconds as the time of waiting for the response of the opposite end.

```
int ethernet1/1
llc2 tpf-time 12
```

### 7.3.5 Configuring the Time of Rejection

The command is

Command	Purpose
[no] llc2 trej-time [seconds]	Used for controlling the time of waiting for the response of remote end to the reject frame. The command "no" can be used for restoring to the default value. Seconds: The seconds of waiting when the remote end is busy. The maximum is 60 seconds, the minimum is 1 second and the default is 3 seconds.

Configuration mode: Interface configuration

**Notes:**

The data receive and send on the two ends of LLC2 link is carried out on the set sequence. When a LLC2 connective end receives 1 frame of opposite end whose sequence number is not the expected one, it will send a REJ (reject) frame and enable a clock. If no response is made at the arrival time, LLC2 link will be disconnected. The command is used for setting the time of waiting for the response of the opposite end to the REJ (reject) frame.

Example: Setting 12 seconds as the waiting time.

```
int ethernet1/1
llc2 trej-time 12
```

### 7.3.6 Configuring the Redial Times

The command is

Command	Purpose
[no]llc2 n2 retry-count	Used for controlling the times of re-sending the frame. The command "no" can be used for restoring to the default value. retry-count:The times of resending frame. The maximum is 255, the minimum is 1 and the default is 8.

Configuration mode: Interface configuration

**Notes:**

When one end of LLC2 sends the data to the opposite end, it will wait for the acknowledgement of the opposite end. If the opposite end does not send the acknowledgement within a given time, the local end will resend the data. But the time of resend shall be limited. When the value of resend times exceeds retry-count, LLC2 will be disconnected. The command is used for setting the times of retry-count.

Example: Setting the times of re-send as 12

```
int ethernet1/1
llc2 n2 12
```

### 7.3.7 Configuring the Size Of Window for Resending

The command is

Command	Purpose
[no]llc2 local-window packet-count	Used for controlling the maximum size of I frame send (namely the size of window for resend) when I frame is not confirmed. The command "no" can be used for restoring to the default value. packet-count:The maximum size of I frame send. The maximum is 127, the minimum is 1 and the default is 7.

Configuration mode: Interface configuration

**Notes:**

When one end of LLC2 link sends data to the opposite end, it can only send a certain amount of data before waiting for the acknowledgement of the opposite end. The command is used for setting the maximum value. When the set value is too big, it may lead to the loss of data because the opposite end is not able to receive all the data.

Example: Setting the size of send window as 12.

```
int ethernet1/1
llc2 local-window 12
```

### 7.3.8 Configuring the Size of Accumulated Data Packet

The command is

Command	Purpose
[no] llc2 holdqueue [packet-count]	Used for controlling the maximum local accumulated size of data packet when I frame (the remote end is busy) cannot be sent. The command "no" can be used for restoring to the default value. packet-count:The maximum size of data packets reserved by I frame when I frame is not confirmed.

Configuration mode: Interface configuration

**Notes:**

When the opposite end is busy, one end of LLC2 link is not able to send data (I frame). All the data shall be reserved before the busyness of the opposite end is cleared. But the reserved amount is limited. The command is used for setting the data amount to be reserved.

Example: Setting maximum data amount to be reserved as 120.

```
int ethernet1/1
llc2 holdqueue 120
```

### 7.3.9 Setting the Acknowledgement Time-Delay

When an I-frame (information frame) is received, an acknowledgement frame shall be sent immediately. In order to reduce the unnecessary acknowledgement, the acknowledgement can be delayed. If information frame is sent, an information frame will be sent as an acknowledgement instead of acknowledge frame. When

the information frame sent by the opposite end exceeds the acknowledged maximum size, an acknowledge frame will be sent immediately rather than at the timeout. The command below can be used for setting the value.

Command	Purpose
<b>llc2 ack-delay-time</b> <i>seconds</i>	Setting the acknowledgement time-delay

### 7.3.10 Setting the Maximum Numbers of Acknowledgement

When the information frame sent by the opposite end exceeds the maximum number of acknowledgement in the process of acknowledging the time delay, the acknowledgement frame shall be sent immediately for clearing the network timeout perceived by the opposite end. The command below can be used for setting the value.

Command	Purpose
<b>llc2 ack-max</b> <i>number</i>	Setting the acknowledgement time-delay.

### 7.3.11 Showing LLC2 Link Information

Command	Purpose
<b>show llc interface</b> [ <i>type number</i> ]	Used for showing the related information of LLC2 link connection.

Configuration Mode: Interface, configuration and global

**Notes:**

Showing the related information of LLC2 link connection. Under interface mode, the command “show llc” is used for displaying LLC2 link information of the interface.

Example: Under interface mode, the command “show llc” is used for showing llc2 information on ethernet1/1.

```
int ethernet1/1
sho llc ethernet1/1
```

### 7.3.12 Debugging LLC2 Link Information

The command is

Command	Purpose
<b>debug llc2</b> [ <i>packet error state</i> ]	Used for opening LLC2 debug switch.

Configuration mode: Management Mode

**Notes:**

packet , Opening the debug switch of LLC2 link status information

Example, opening the debug switch of LLC2 link.

```
debug llc2 packet
debug llc2 state
debug llc2 error
```

## 7.4 Example of LLC2 Configuration

The number of LLC2 frame received before the response can be configured. For example, it is supposed that two information frames are received at the time 0 rather than at the maximum number 3, the responses of these frames are not sent. If the third frame that makes the router response is not received within 800 ms, the response will be transmitted as the time-delay timer is activated.

```
interface interface e1/1
llc2 ack-max 3
llc2 ack-delay-time 800
```

In this connection, as it is told that all the frames are received, the counter that calculates the maximum number of information frame is reset as 0.

### 7.4.1 Configuring SDLC as Two-Way and Concurrent Mode

SDLC two-way and concurrent mode allows master SDLC link station to use a full duplex serial circuit. When an outstanding polling occurs, the master SDLC link station is able to send the data to the slave station. The two-way and concurrent mode works only on the side of SDLC master station. In the slave link station, it response to the polling sent from the master station.

SDLC two-way and concurrent mode runs in the multi-branch link environment or point-to-point link environment.

In the multi-branch link environment, a two-way and concurrent master station is able to poll a slave station and receive the data from the slave station and send the data (information frame) to other slave stations.

In the point-to-point link environment, so long as no maximum limit on reaching the window, a two-way and concurrent master station is able to send the data (information frame) to the slave station even if there is an outstanding polling.

Any one of the commands can be used under interface configuration mode for activating the two-way and concurrent mode:

Command	Purpose
<b>sdhc simultaneous full-datamode</b>	Setting the send of data from master station to the polled slave station and receive of data from it.
<b>sdhc simultaneous half-datamode</b>	Shutting down the master station sending the data to the slave station.

### 7.4.2 Configuring SDLC Timer and Re-Sending Times

When SDLC workstation sends frame, it will wait for the response of receive end. The response indicates the frame has been received. The response time allowed by the router before re-sending frame can be amended. The times of re-sending the frame by the software can be set before terminating SDLC session process. Through controlling these values, by controlling these values, the network overhead can be reduced in continuing to detect the transmitted frame.

One or two commands below can be used under interface configuration mode for configuring SDLC timer and retransmission times:

Command	Purpose
---------	---------

<b>sdhc t1</b> <i>milliseconds</i>	Controlling the total time of software of waiting for response.
<b>sdhc n2</b> <i>retry-count</i>	Configuring the times of software of retrying a timeout operation.

### 7.4.3 Configuring the Number of SDLC Frame and Information Frame

The maximum length of input frame and the maximum number of the information frame (or the size of window) received before router sends response to the receive end can be configured. When the configured value is relative big, the network overhead can be reduced.

The command below can be used under interface configuration mode for configuring SDLC frame and number of information frame.

Command	Purpose
<b>sdhc n1</b> <i>bit-count</i>	Configuring the maximum length of input frame
<b>sdhc k</b> <i>window-size</i>	Configuring the size of local window of router
<b>sdhc poll-limit-value</b> <i>count</i>	Configuring the times of master station's polling to the slave station.

### 7.4.4 Controlling the Size of Cache

The size of cache can be controlled. The cache is used for storing the data that is not decided to be sent to remote SDLC station. The command is especially useful in SDLC protocol convert equipment that implements the communication between SNA workstation whose link layer protocol is LLC2 in token-ring local area network (LAN) and SNA workstation whose link layer protocol is SDLC on serial link. The frame length and the size of window on the token-ring are usually much bigger than the acceptable ones on the serial link. What's more, the serial link is slower than token-ring.

In order to control the accumulation problem produced in the high-speed data transmission from token-ring to serial link, the command below can be used on the basis of each address under interface configuration mode:

Command	Purpose
<b>sdhc holdqueue address</b> <i>queue-size</i>	Setting the maximum quantity of the data packets stored in the sequence before transmission.

### 7.4.5 Controlling the polling of slave station

The interval of router's polling to the slave station, the length of time of sending data from master station to slave station and how long the software polls a slave station before moving to the next station can be controlled.

The following points should be noted in using these commands:

Only when the slave station is polled by the master station, the data can be transmitted. When the polling terminates and the value of timer is too big, the response time of slave station will add. When the value of the timer is reduced too small, it will lead to the congestion of serial link and data flood due to the excessive and unnecessary polling frames sent from the slave station, which takes the extra CPU time for dealing with them. The communication efficiency between master station and single slave station can be improved by increasing

the limit value of polling, but it may delay the polling to other slave stations.

One or more commands below can be used under interface configuration mode for controlling the polling of slave station:

Command	Purpose
<b>sdhc poll-pause-timer</b> <i>milliseconds</i>	Configuring the waiting time interval of router's polling to two slave stations on some single serial port.
<b>sdhc poll-limit-value</b> <i>count</i>	Configuring the times of a master station's polling to slave station.

The "def" format of these commands can be used for restoring to the default polling value.

## 7.4.6 Configuring SDLC Interface as Half-Duplex Mode

Under default state, SDLC interface runs under full duplex mode. The command below can be used under interface configuration mode for configuring SDLC interface as half-duplex mode.

Command	Purpose
<b>half-duplex</b>	Configuring SDLC interface as half-duplex mode.

## 7.4.7 Configuring XID Value

XID value set in the router shall be consistent with the corresponding parameter set on token-ring host with which SDLC equipment will communicate and shall match with the corresponding system parameter in IDBLK and IDNUM defined in VTAM of token ring host.

### Notes:

Configuring XID value will affect the attribute of the interface. If XID value is configured, it means that the equipment connected with the interface is Pu2.0. XID value can be configured after the port is shut down.

The command below can be used under interface configuration mode for configuring XID value.

Command	Purpose
<b>sdhc xid address</b> <i>xid</i>	Designating XID value related to SDLC station.

## 7.4.8 Configuring the Maximum Value of SDLC Information Frame

Normally, the router and SDLC equipment that interacts with router protocol shall support the same and maximum length of SDLC information frame. The bigger the value is, the more efficient the link is used and the performance will be better.

After SDLC equipment is configured with the maximum possible information frame to be sent, the router shall be configured for supporting the same maximum length of information frame. The default value is 265 bytes. The maximum value supported by the software must be smaller than the maximum frame value of LLC2 defined at the time of configuring the maximum length of LLC2 information frame.

The command below can be used under interface configuration mode for configuring the maximum value of SDLC information frame:

Command	Purpose
<b>sdhc sdhc-largest-frame</b> <i>address size</i>	Configuring the maximum length of information frame that can be sent or received by the designated SDLC station.

## 7.4.9 Monitoring SDLC Workstation

The command below can be used under management mode for monitoring the configuration of SDLC workstation and deciding which SDLC parameter needs to be adjusted.

Command	Purpose
<b>show interfaces</b>	Showing configuration information of SDLC workstation.

# Chapter 8 AAA Configuration

## 8.1 AAA Overview

Access control is used to control the users to access SWITCH or NAS and to limit their service types. Authentication, authorization, and accounting (AAA) network security services provide the primary framework through which you set up access control on your SWITCH or access server.

### 8.1.1 AAA Security Service

AAA is an architectural framework for configuring a set of three independent security functions in a consistent manner. AAA provides a modular way of performing the following services:

- **Authentication:** It is a method of identifying users, including username/password inquiry and encryption according to the chosen security protocol.

Authentication is a method to distinguish the user's identity before users access the network and enjoy network services. AAA authentication can be configured through the definition of an authentication method list and then application of this method list on all interfaces. This method list defines the authentication type and the execution order; any defined authentication method list must be applied on a specific interface before it is executed. The only exception is the default authentication method list (which is named default). If there are no other authentication method lists, the default one will be applied on all interfaces automatically. If anyone is defined, it will replace the default one. For how to configure all authentications, see "Authentication Configuration".

- **Authorization:** it is a remote access control method to limit user's permissions.

AAA authorization takes effect through a group of features in which a user is authorized with some permissions. Firstly, the features in this group will be compared with the information about a specific user in the database, then the comparison result will be returned to AAA to confirm the actual permissions of this user. This database can be at the accessed local server or SWITCH, or remote Radius/TACACS+ server. The Radius or TACACS+ server conducts user authorization through a user-related attribute-value peer. The attribute value (AV) defines the allowably authorized permissions. All authorization methods are defined through AAA. Like authentication, an authorization method list will be first defined and then this list will be applied on all kinds of interfaces. For how to carry on the authorization configuration, see "Authorization Configuration".

- **Accounting:** it is a method to collect user's information and send the information to the security server. The collected information can be used to open an account sheet, make auditing and form report lists, such as the user ID, start/end time, execution commands, and the number of packets or bytes.

The accounting function can track the services that users access, and at the same time track the service-consumed network resource number. When AAA accounting is activated, the access server can report user's activities to the TACACS+ or Radius server in way of accounting. Each account contains an AV peer, which is stored on the security server. The data can be used for network management, client's accounting analysis or audit. Like authentication and authorization, an accounting method list must be first defined and then applied on different interfaces. For how to carry on the accounting configuration, see "Accounting Configuration".

### 8.1.2 Benefits of Using AAA

AAA provides the following benefits:

- Increased flexibility and control of access configuration
- Scalability

- Standardized authentication methods, such as RADIUS, TACACS+, and Kerberos
- Multiple backup systems

### 8.1.3 AAA Principles

AAA is designed to enable you to dynamically configure the type of authentication and authorization you want on a per-line (per-user) or per-service (for example, IP, IPX, or VPDN) basis. You define the type of authentication and authorization you want by creating method lists, then applying those method lists to specific services or interfaces.

### 8.1.4 AAA Method List

To configure AAA, define a named method list first and then apply it to the concrete service or interface. This method list defines the running AAA type and their running sequence. Any defined method list must be applied to a concrete interface or service before running. The only exception is the default method list. The default method list is automatically applied to all interfaces or services. Unless the interface applies other method list explicitly, the method list will replace the default method list.

A method list is a sequential list that defines the authentication methods used to authenticate a user. In AAA method list you can specify one or more security protocols. Thus, it provides with a backup authentication system, in case the initial method is failed. Our SWITCH software uses the first method listed to authenticate users; if that method does not respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or the authentication method list is exhausted, in which case authentication fails.

It is important to notice that the SWITCH software attempts authentication with the next listed authentication method only when there is no response from the previous method. If authentication fails at any point in this cycle—meaning that the security server or local user name database responds by denying the user access—the authentication process stops and no other authentication methods are attempted.

The following figures shows a typical AAA network configuration that includes four security servers: R1 and R2 are RADIUS servers, and T1 and T2 are TACACS+ servers. Take the authentication as an example to demonstrate the relation between AAA service and AAA method list.

Figure 8-1 Typical AAA Network Configuration

In this example, default is the name of the method list, including the protocol in the method list and the request

sequence of the method list follows the name. The default method list is automatically applied to all interfaces. When a remote user attempts to dial in to the network, the network access server first queries R1 for authentication information. If R1 authenticates the user, it issues a PASS response to the network access server and the user is allowed to access the network. If R1 returns a FAIL response, the user is denied access and the session is terminated. If R1 does not respond, then the network access server processes that as an ERROR and queries R2 for authentication information. This pattern continues through the remaining designated methods until the user is either authenticated or rejected, or until the session is terminated.

A FAIL response is significantly different from an ERROR. A FAIL means that the user has not met the criteria contained in the applicable authentication database to be successfully authenticated. Authentication ends with a FAIL response. An ERROR means that the security server has not responded to an authentication query. Only when an ERROR is detected will AAA select the next authentication method defined in the authentication method list.

Suppose the system administrator wants to apply the method list to a certain or a specific port. In such case, the system administrator should create a non-default method list and then apply the list of this name to an appropriate port.

### **8.1.5 AAA Configuration Process**

You must first decide what kind of security solution you want to implement. You need to assess the security risks in your particular network and decide on the appropriate means to prevent unauthorized entry and attack. Before you configure AAA, you need know the basic configuration procedure. To do AAA security configuration on SWITCH or access servers, perform the following steps:

- If you decide to use a security server, configure security protocol parameters first, such as RADIUS, TACACS+, or Kerberos.
- Define the method lists for authentication by using an AAA authentication command.
- Apply the method lists to a particular interface or line, if required.
- (Optional) Configure authorization using the aaa authorization command.
- (Optional) Configure accounting using the aaa accounting command.

## **8.2 Authentication Configuration**

### **8.2.1 AAA Authentication Configuration Task List**

- Configuring Login Authentication Using AAA
- Configuring PPP Authentication Using AAA
- Enabling Password Protection at the Privileged Level
- Configuring Message Banners for AAA Authentication
- Modifying the Notification Character String for Username Input
- Modifying AAA authentication password-prompt
- Creating local user name authentication database
- Creating the Authentication Database with the Local Privilege

## 8.2.2 AAA Authentication Configuration Task

General configuration process of AAA authentication

To configure AAA authentication, perform the following configuration processes:

- (1) If you decide to use a separate security server, configure security protocol parameters, such as RADIUS, or TACACS+. Refer to the relevant section for the concrete configuration methods.
- (2) Configuring Authentication Method List Using aaa authentication
- (3) If necessary, apply the accounting method list to a specific interface or line.

## Configuring Login Authentication Using AAA

The AAA security services facilitate a variety of login authentication methods. Use the `aaa authentication login` command to enable AAA authentication no matter which of the supported login authentication methods you decide to use. With the `aaa authentication login` command, you create one or more lists of authentication methods that are tried at login. These lists are applied using the login authentication line configuration command. After the authentication method lists are configured, you can apply these lists by running login authentication. You can run the following command in global configuration mode to start the configuration:

Command	Purpose
<code>aaa authentication login {default   list-name}method1 [method2...]</code>	Enables AAA globally.
<code>line { console   vty } line-number [ending-line-number]</code>	Enter the configuration mode of a line.
<code>login authentication {default   list-name}</code>	Applies the authentication list to a line or set of lines. (In the line configuration mode)

The list-name is a character string used to name the list you are creating. The key word method specifies the actual method of the authentication method. The additional methods of authentication are used only if the previous method returns an error, not if it fails. To specify that the authentication should succeed even if all methods return an error, specify none as the final method in the command line.

The default parameter can create a default authentication list, which will be automatically applied to all interfaces. For example, to specify that authentication should succeed even if (in this example) the TACACS+ server returns an error, enter the following command:

```
aaa authentication login default group radius
```

**Note:**

Because the none keyword enables any user logging in to successfully authenticate, it should be used only as a backup method of authentication.

If you cannot find the authentication method list, you can only login through the console port. Any other way of login is in accessible.

The following table lists the supported login authentication methods:

Keyword	Notes:
enable	Uses the enable password for authentication.
group name	Uses named server group for authentication.
group radius	Uses RADIUS for authentication.
group tacacs+	Uses group tacacs+ for authentication.
line	Uses the line password for authentication.
local	Uses the local username database for authentication.
localgroup	Uses the local strategy group username database for authentication.
local-case	Uses case-sensitive local user name authentication.
none	Passes the authentication unconditionally.

- (1) Using the enable password to carry on the login authentication:

To specify the enable password as the user authentication method, run the following command:

```
aaa authentication login default enable
```

(2) Using the line password to login

Use the `aaa authentication login` command with the `line` method keyword to specify the line password as the login authentication method. For example, to specify the line password as the method of user authentication at login when no other method list has been defined, enter the following command:

```
aaa authentication login default line
```

Before you can use a line password as the login authentication method, you need to define a line password.

(3) Using the local password to carry on the login authentication:

When you run `aaa authentication login`, you can use the keyword "local" to designate the local database as the login authentication method. For example, if you want to specify the local username database as the user authentication method and not define any other method, run the following command:

```
aaa authentication login default local
```

For information about adding users into the local username database, refer to the section "Establishing Username Authentication" in this chapter.

(4) Login Authentication Using RADIUS

Use the `aaa authentication login` command with the `group radius` method to specify RADIUS as the login authentication method. For example, to specify RADIUS as the method of user authentication at login when no other method list has been defined, enter the following command:

```
aaa authentication login default group radius
```

Before you can use RADIUS as the login authentication method, you need to enable communication with the RADIUS security server. For more information about establishing communication with a RADIUS server, refer to the chapter "Configuring RADIUS."

## Enabling Password Protection at the Privileged Level

Use the `aaa authentication enable default` command to create a series of authentication methods that are used to determine whether a user can access the privileged EXEC command level. You can specify up to four authentication methods. The additional methods of authentication are used only if the previous method returns an error, not if it fails. To specify that the authentication should succeed even if all methods return an error, specify `none` as the final method in the command line. Use the following command in global configuration mode:

Command	Purpose
<code>aaa authentication enable default method1 [method2...]</code>	Enables user ID and password checking for users requesting privileged EXEC level.

The method argument refers to the actual list of methods the authentication algorithm tries, in the sequence entered.

The following table lists the supported enable authentication methods:

Keyword	Notes
<code>enable</code>	Uses the enable password for authentication.
<code>group group-name</code>	Uses named server group for authentication.
<code>group radius</code>	Uses RADIUS authentication.
<code>group tacacs+</code>	Uses tacacs+ for authentication.
<code>line</code>	Uses the line password for authentication.
<code>none</code>	Passes the authentication unconditionally.

When configuring enable authentication method as the remote authentication, use RADIUS for authentication.

Do as follows:

- (5) Uses RADIUS for enable authentication:

The user name for authentication is `$ENABLE/level$`; level is the privileged level the user enters, that is, the number of the privileged level after enable command. For instance, if the user wants to enter the privileged level 7, enter command `enable 7`; if configuring RADIUS for authentication, the user name presenting to Radius-server host is `$ENABLE7$`; the privileged level of enable is 15 by default, that is, the user name presenting to Radius-server host in using RADIUS for authentication is `$ENABLE15$`. The user name and the password need to be configured on Radius-server host in advance. The point is that in user database of Radius-server host, the Service-Type of the user specifying the privileged authentication is 6, that is, Admin-User.

## **Configuring Message Banners for AAA Authentication**

The banner of configurable, personal logon or failed logon is supported. When AAA authentication fails during system login, the configured message banner will be displayed no matter what the reason of the failed authentication is.

## Configuring the registration banner

Run the following command in global configuration mode.

Command	Purpose
<b>aaa authentication banner</b> <i>delimiter text-string delimiter</i>	Configures a personal logon registration banner.

## Configuring the banner of failed logon

Run the following command in global configuration mode.

Command	Purpose
<b>aaa authentication fail-message</b> <i>delimiter</i> <i>text-string delimiter</i>	Configures a personal banner about failed logon.

## Usage Guidelines

When creating a banner, you need to configure a delimiter and then to configure the text string itself. The delimiter is to notify that the following text string will be displayed as the banner. The delimiter appears repeatedly at the end of the text character string, indicating that the banner is ended.

## Modifying the Notification Character String for Username Input

To modify the default text of the username input prompt, run `aaa authentication username-prompt`. You can run `no aaa authentication username-prompt` to resume the password input prompt.

username :

The `aaa authentication username-prompt` command does not change any prompt information provided by the remote TACACS+ server or the RADIUS server. Run the following command in global configuration mode:

Command	Purpose
<code>aaa authentication username-prompt <i>text-string</i></code>	Modifies the default text of the username input prompt.

## Modifying AAA authentication password-prompt

To change the text displayed when users are prompted for a password, use the `aaa authentication password-prompt` command. To return to the default password prompt text, use the `no` form of this command. You can run `no aaa authentication username-prompt` to resume the password input prompt.

password :

The `aaa authentication password-prompt` command does not change any prompt information provided by the remote TACACS+ server or the RADIUS server. Run the following command in global configuration mode:

Command	Purpose
<code>aaa authentication password-prompt text-string</code>	String of text that will be displayed when the user is prompted to enter a password.

## Creating the Authentication Database with the Local Privilege

To create the enable password database with the local privilege level, run `enable password { [encryption-type] encrypted-password} [level level]` in global configuration mode. To cancel the enable password database, run `no enable password [level level]`.

**enable password** { [*encryption-type*] *encrypted-password*} [**level** *level*]

**no enable password** [**level** *level*]

### 8.2.3 AAA Authentication Configuration Example

## RADIUS Authentication Example

The following example shows how to configure the SWITCH to authenticate and authorize using RADIUS:

```
aaa authentication login radius-login group radius local
aaa authorization network radius-network group radius
line vty 3
login authentication radius-login
```

The meaning of each command line is shown below:

- The `aaa authentication login radius-login group radius local` command configures the SWITCH to use RADIUS for authentication at the login prompt. If RADIUS returns an error, the user is authenticated using the local database.
- The `aaa authorization network radius-network group radius` command queries RADIUS for network authorization, address assignment, and other access lists.
- The `login authentication radius-login` command enables the radius-login method list for line 3.

## 8.3 Authorization Configuration

### 8.3.1 AAA Authorization Configuration Task List

- Configuring EXEC authorization through AAA

### 8.3.2 AAA Authorization Configuration Task

## General configuration process of AAA authorization

To configure AAA authorization, perform the following configuration processes :

- (6) If you decide to use a separate security server, configure security protocol parameters, such as RADIUS, or TACACS+. Refer to the relevant section for the concrete configuration methods.
- (7) Run `aaa authorization` to define the authorization method list. The authorization service is not provided by default.
- (8) If necessary, apply the accounting method list to a specific interface or line.

## Configuring EXEC authorization through AAA

To enable AAA authorization, run `aaa authorization`. The `aaa authorization exec` command can create one or several authorization method lists and enable the EXEC authorization to decide whether the EXEC hull program is run by the users or not, or decide whether the users are authorized with the privilege when entering the EXEC hull program. After the authorization method lists are configured, you can apply these lists by running login authorization. You can run the following command in global configuration mode to start the configuration:

Command	Purpose
<code>aaa authorization exec {default   list-name}method1 [method2...]</code>	Creates the global authorization list.
<code>line [console   vty] line-number [ending-line-number]</code>	Enter the configuration mode of a line.
<code>login authorization {default   list-name}</code>	Applies the authorization list to a line or set of lines. (In the line configuration mode)

The list-name is a character string used to name the list you are creating. The method keyword is used to designate the real method for the authorization process. Only when the previously-used method returns the authorization error can other authorization methods be used. If the authorization fails because of the previous method, other authorization methods will not be used. If you requires the EXEC shell to be entered even when all authorization methods returns the authorization errors, designate none as the last authorization method in the command line.

The default parameter can create a default authentication list, which will be automatically applied to all interfaces. For example, you can run the following command to designate RADIUS as the default authorization method of EXEC:

```
aaa authorization exec default group radius
```

**Note:**

If the authorization method list cannot be found during authorization, the authorization will be directly passed without the authorization service conducted.

The following table lists currently-supported EXEC authorization methods:

Keyword	Notes:
<code>group WORD</code>	Uses the named server group to conduct authorization.
<code>group radius</code>	Uses RADIUS authorization.
<code>group tacacs+</code>	Uses tacacs+ authorization.
<code>local</code>	Uses the local database to perform authorization.
<code>if-authenticated</code>	Automatically authorizes the authencated user with all required functions.
<code>none</code>	Passes the authorization unconditionally.

### 8.3.3 AAA Authorization Examples

## Example of Local EXEC Authorization

The following example shows how to perform the local authorization and local authorization by configuring the SWITCH:

```
aaa authentication login default local
aaa authorization exec default local
!
localauthor a1
  exec privilege default 15
!
local author-group a1
  username exec1 password 0 abc
  username exec2 password 0 abc author-group a1
  username exec3 password 0 abc maxlinks 10
  username exec4 password 0 abc autocommand telnet 172.16.20.1
!
```

The following shows the meaning of each command line:

- The `aaa authentication login default local` command is used to define the default login-authentication method list, which will be automatically applied to all login authentication services.
- The command is used to define the default EXEC authorization method list, which will be automatically applied to all users requiring to enter the EXEC shell.
- Command `localauthor a1` defines a local authority policy named `a1`. Command `exec privilege default 15` means the privileged level of `exec login` user is 15 by default.
- Command `local author-group a1` means apply the local authorization policy `a1` to global configuration (the default local policy group).
- Command `username exec1 password 0 abc` defines an account `exec1` with password `abc` in the global configuration mode.
- Command `username exec2 password 0 abc author-group a1` defines an account `exec 2` with password `abc` in the global configuration mode. The account is applied to the local authorization policy `a1`.
- Command `username exec3 password 0 abc maxlinks 10` defines an account `exec 3` with password `abc` in the global configuration mode. The account makes 10 users available simultaneously.
- Command `username exec4 password 0 abc autocommand telnet 172.16.20.1` defines an account `exec4` with password `abc`. `telnet 172.16.20.1` is automatically run when the user login the account.

## 8.4 AAA Accounting Configuration

### 8.4.1 AAA Accounting Configuration Task List

- Configuring Connection Accounting using AAA
- Configuring Network Accounting using AAA

### 8.4.2 AAA Accounting Configuration Task

## General configuration process of AAA accounting

To configure AAA accounting, perform the following configuration processes:

- (9) If you decide to use a separate security server, configure security protocol parameters, such as RADIUS, or TACACS+. Refer to the relevant section for the concrete configuration methods.
- (10) Apply the method lists to a particular interface or line, if required. The accounting service is not provided by default.
- (11) If necessary, apply the accounting method list to a specific interface or line.

## Configuring Connection Accounting Using AAA

To enable AAA accounting, run command `aaa accounting`. To create a or multiple method list(s) to provide accounting information about all outbound connections made from the SWITCH, use the `aaa accounting connection` command. The outbound connections include Telnet, PAD, H323 and rlogin. Only H323 is supported currently. You can run the following command in global configuration mode to start the configuration:

Command	Purpose
<code>aaa accounting connection {default   list-name} {{{start-stop   stop-only} group groupname}   none}</code>	Establishes the global accounting list.

The list-name is a character string used to name the list you are creating. The method keyword is used to designate the real method for the accounting process.

The following table lists currently-supported connection accounting methods:

Keyword	Notes:
group <i>WORD</i>	Uses the named server group to conduct accounting.
group radius	Uses the RADIUS for accounting.
group tacacs+	Uses the TACACS+ for accounting.
none	Disables accounting services for the specified line or interface.
stop-only	Sends a "stop" record accounting notice at the end of the requested user process.
start-stop	RADIUS or TACACS+ sends a "start" accounting notice at the beginning of the requested process and a "stop" accounting notice at the end of the process.

## Configuring Network Accounting using AAA

To enable AAA accounting, run command `aaa accounting`. The `aaa accounting network` command can be used to establish one or multiple accounting method lists. The network accounting is enabled to provide information to all PPP/SLIP sessions, these information including packets, bytes and time accounting. You can run the following command in global configuration mode to start the configuration:

Command	Purpose
<code>aaa accounting network {default   list-name} {{{start-stop   stop-only} group groupname}   none}</code>	Establishes the global accounting list.

The list-name is a character string used to name the list you are creating. The method keyword is used to designate the real method for the accounting process.

The following table lists currently-supported network accounting methods:

Keyword	Notes:
group <i>WORD</i>	Uses the named server group to conduct accounting.
group radius	Uses the RADIUS for accounting.
group tacacs+	Uses the TACACS+ for accounting.
none	Disables accounting services for the specified line or interface.
stop-only	Sends a "stop" record accounting notice at the end of the requested user process.
start-stop	RADIUS or TACACS+ sends a "start" accounting notice at the beginning of the requested process and a "stop" accounting notice at the end of the process.

## Configuring Accounting Update through AAA

To activate the AAA accounting update function for AAA to send the temporary accounting record to all users in the system, run the following command: You can run the following command in global configuration mode to start the configuration:

Command	Purpose
<code>aaa accounting update [newinfo] [periodic number]</code>	Enables AAA accounting update.

If the `newinfo` keyword is used, the temporary accounting record will be sent to the accounting server when there is new accounting information to be reported. For example, after IPCP negotiates with the IP address of the remote terminal, the temporary accounting record, including the IP address of the remote terminal, will be sent to the accounting server.

When the `periodic` keyword is used, the temporary accounting record will be sent periodically. The period is defined by the `number` parameter. The temporary accounting record includes all accounting information occurred before the accounting record is sent.

The two keywords are contradictable, that is, the previously-configured parameter will replace the latter-configured one. For example, if `aaa accounting update periodic` and then `aaa accounting update new info` are configured, all currently-registered users will generate temporary accounting records periodically. All new users have accounting records generated according to the `new info` algorithm.

## Limiting User Accounting Without Username

To prevent the AAA system from sending the accounting record to the users whose username character string is null, run the following command in global configuration mode:

- **aaa accounting suppress null-username**

## 8.5 Local Account Policy Configuration

### 8.5.1 Local Account Policy Configuration Task List

- Local authentication policy configuration
- Local authorization policy configuration
- Local password policy configuration
- Local policy group configuration

### 8.5.2 Local Account Policy Configuration Task

## Local authentication policy configuration

To enter local authentication configuration, run command `localauthen WORD` in global configuration mode.

(1) The max login tries within a certain time

**login max-tries** <1-9> **try-duration** *1d2h3m4s*

The configured local authentication policy can be applied to a local policy group or directly applied to a local account. It gives priority to some local account directly.

## Local authorization policy configuration

To enter local authorization configuration, run command `localauthor WORD` in global configuration mode.

(1) To authorize priority for login users.

**exec privilege {default | console | ssh | telnet} <1-15>**

The configured local authorization policy can be applied to a local policy group or directly applied to a local account. It gives priority to some local account directly.

## Local password policy configuration

To enter local authorization configuration, run command `localpass WORD` in global configuration mode.

- (1) The password cannot be the same with the user name

**non-user**

- (2) The history password check (The new password cannot be the same with the history password. The history password record is 20.)

**non-history**

- (3) Specify the components of the password (complicate the password)

**element** *[number] [lower-letter] [upper-letter] [special-character]*

- (4) Specify the components of the password (complicate the password)

**min-length** *<1-127>*

- (5) password validity period (the validity of the password)

**validity** *1d2h3m4s*

The configured local authorization policy can be applied to a local policy group or directly applied to a local account. It gives priority to some local account directly.

Local policy group configuration

To configure local policy group, run `localgroup WORD` in global configuration mode:

- (1) local authentication configuration: apply the configured local authentication policy to the policy group

**local authen-group** *WORD*

- (2) local authorization configuration: apply the configured local authorization policy to the policy group

**local author-group** *WORD*

- (3) local password configuration: apply the configured local password policy to the policy group

**local pass-group** *WORD*

- (4) local account configuration: set the maxlinks and freeze for the policy group

**local user** **{ {maxlinks <1-255>} | { freeze WORD } }**

- (5) account configuration: set the account for the policy group and establish the local database

**username** *username* **[ [password password | encryption-type encrypted-password] | maxlinks number | authen-group WORD | author-group WORD | pass-group WORD | bind-ip A.B.C.D | bind-mac H:H:H:H:H:H | bind-pool WORD | bind-port port | callback-dialstring string | callback-line line | callback-rotary rotary | nocallback-verify | nohangup | noescape]\* | autocommand command [line]&<0-n>**

The configured local policy group can be used in local authentication and authorization. Local method is applicable to the default policy group and `localgroup word` is to a local policy group.

### 8.5.3 Local Account Policy Example

This section provides one sample configuration using local account policy. The following example shows how

to configure the local authentication and local authorization.

```
aaa authentication login default local
aaa authorization exec default local
!
localpass a3
  non-user
  non-history
  element number lower-letter upper-letter special-character
  min-length 10
  validity 2d
!
localauthen a1
  login max-tries 4 try-duration 2m
!
localauthor a2
  exec privilege default 15
!
local pass-group a3
local authen-group a1
local author-group a2
!
```

The meaning of each command line is shown below:

- The `aaa authentication login default local` command is used to define the default login-authentication method list, which will be automatically applied to all login authentication services.
- The command is used to define the default EXEC authorization method list, which will be automatically applied to all users requiring to enter the EXEC shell.
- The command `localpass a3` defines the password policy named a3.
- The command `localauthen a1` defines the authentication policy named a1.
- The command `localauthor a2` defines the authorization policy named a2.
- The command `local pass-group a3` applies the password policy named a3 to the default policy group.
- The command `localauthen a1` applies the authentication policy named a1 to the default policy group.
- The command `localauthor a2` applies the authorization policy named a2 to the default policy group.

# Chapter 9 Configuring RADIUS

This chapter describes the Remote Authentication Dial-In User Service (RADIUS) security system, defines its operation, and identifies appropriate and inappropriate network environments for using RADIUS technology. The "RADIUS Configuration Task List" section describes how to configure RADIUS with the authentication, authorization, and accounting (AAA) command set. The last section in this chapter-RADIUS Configuration Examples- provides with two examples. Refer to RADIUS Configuration Commands for more details of RADIUS command.

## 9.1 Overview

### 9.1.1 RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. In the implementation, RADIUS clients run on SWITCHs and send authentication requests to a central RADIUS server that contains all user authentication and network service access information. RADIUS has been implemented in a variety of network environments that require high levels of security while maintaining network access for remote users.

Use RADIUS in the following network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors' access servers, dial-in users are authenticated through a RADIUS server.
- Networks in which a user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to a single protocol such as Point-to-Point Protocol (PPP). For example, when a user logs in, RADIUS identifies this user as having authorization to run PPP using IP address 10.2.3.4 and the defined access list is started.
- Networks that require resource accounting. You can use RADIUS accounting independent of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, indicating the amount of resources (such as time, packets, bytes, and so on) used during the session.

RADIUS is not suitable in the following network security situations:

- RADIUS does not support the following protocols :
  - AppleTalk Remote Access (ARA)
  - NetBIOS Frame Control Protocol (NBFCP)
- NetWare Asynchronous Services Interface (NASI)
- X.25 PAD connections
- Conditions of SWITCH to other switching devices. RADIUS does not provide two-way authentication. On the SWITCH only incoming call authentication is available when running RADIUS. The outbound call is impossible.
- Networks using a variety of services. RADIUS generally binds a user to one service model.

## 9.1.2 RADIUS Operation

When a user attempts to log in and authenticate to an access server using RADIUS, the following steps occur:

- (12) The user is prompted for and enters a username and password.
- (13) The username and encrypted password are sent over the network to the RADIUS server.
- (14) The user receives one of the following responses from the RADIUS server:

ACCEPT—The user is authenticated.

REJECT—The user is not authenticated and is prompted to reenter the username and password, or access is denied.

CHALLENGE—A challenge is issued by the RADIUS server. The challenge collects additional data from the user.

The ACCEPT or REJECT response is bundled with additional data that is used for EXEC or network authorization. You must first complete RADIUS authentication before using RADIUS authorization. The additional data included with the ACCEPT or REJECT packets consists of the following:

Services that the user can access, including Telnet or rlogin.

Connection parameters, including the host or client IP address, access list, and user timeouts.

## 9.2 RADIUS Configuration Steps

To configure RADIUS on your SWITCH or access server, you must perform the following tasks:

- Use the `aaa authentication global` configuration command to define method lists for RADIUS authentication. For more information about using the `aaa authentication` command, refer to the "Configuring Authentication" chapter.
- Use line and interface commands to enable the defined method lists to be used. For more information, refer to the "Configuring Authentication" chapter.

The following configuration tasks are optional:

- If necessary, run `aaa authorization` in global configuration mode to authorize the user's service request. For more information about using the `aaa authorization` command, refer to the "Configuring Authorization" chapter.
- If necessary, run `aaa accounting` in global configuration mode to record the whole service procedure. For more information about running `aaa accounting`, see Record Configuration.

## 9.3 RADIUS Configuration Task List

- Configuring SWITCH to RADIUS Server Communication
- Configuring SWITCH to Use Vendor-Specific RADIUS Attributes
- Specifying RADIUS Authentication
- Specifying RADIUS Authorization
- Specifying RADIUS Accounting

## 9.4 RADIUS Configuration Task

### 9.4.1 Configuring Switch to RADIUS Server Communication

The RADIUS host is normally a multiuser system running RADIUS server software from Livingston, Merit, Microsoft, or another software provider.

A RADIUS server and a Cisco router use a shared secret text string to encrypt passwords and exchange

responses.

To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the router.

To configure per-server RADIUS server communication, use the following command in global configuration mode:

command	purpose
<b>radius-server host</b> <i>ip-address</i> [ <b>auth-port</b> <i>port-number</i> ][ <b>acct-port</b> <i>portnumber</i> ]	Specifies the IP address or host name of the remote RADIUS server host and assign authentication and accounting destination port numbers.
<b>radius-server key</b> <i>string</i>	Specifies the shared secret text string used between the router and a RADIUS server.

To configure global communication settings between the router and a RADIUS server, use the following radius-server commands in global configuration mode: :

command	purpose
<b>radius-server retransmit</b> <i>retries</i>	Specifies how many times the switch transmits each RADIUS request to the server before giving up (the default is 2).
<b>radius-server timeout</b> <i>seconds</i>	Specifies for how many seconds a switch waits for a reply to a RADIUS request before retransmitting the request.
<b>radius-server deadtime</b> <i>minutes</i>	Specifies for how many minutes a RADIUS server that is not responding to authentication requests is passed over by requests for RADIUS authentication.

## 9.4.2 Configuring Switch to Use Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the network access server and the RADIUS server by using the vendor-specific attribute (attribute 26).

Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use.

For more information about vendor-IDs and VSAs, refer to RFC 2138, Remote Authentication Dial-In User Service (RADIUS). To configure the network access server to recognize and use VSAs, use the following command in global configuration mode:

command	purpose
<b>radius-server vsa send</b> [authentication]	Enables the network access server to recognize and use VSAs as defined by RADIUS IETF attribute 26.

## 9.4.3 Specifying RADIUS Authentication

After you have identified the RADIUS server and defined the RADIUS authentication key, you must define method lists for RADIUS authentication. Because RADIUS authentication is facilitated through AAA, you must enter the `aaa authentication` command, specifying RADIUS as the authentication method. For more information, refer to the chapter "Configuring Authentication."

## 9.4.4 Specifying RADIUS Authorization

AAA authorization lets you set parameters that restrict a user's access to the network. Authorization using RADIUS provides one method for remote access control, including one-time authorization or authorization for each service, per-user account list and profile, user group support, and support of IP, IPX, ARA, and Telnet. Because RADIUS authorization is facilitated through AAA, you must issue the `aaa authorization` command, specifying RADIUS as the authorization method. For more information, refer to the chapter "Configuring Authorization."

## 9.4.5 Specifying RADIUS Accounting

The AAA accounting feature enables you to track the services users are accessing as well as the amount of network resources they are consuming. Because RADIUS accounting is facilitated through AAA, you must issue the `aaa accounting` command, specifying RADIUS as the accounting method. For more information, refer to the chapter "Configuring Accounting."

## 9.5 RADIUS Configuration Examples

### 9.5.1 RADIUS Authentication Example

The following example shows how to configure the switch to authenticate and authorize using RADIUS :

```
aaa authentication login use-radius group radius local
```

The lines in this sample RADIUS authentication and authorization configuration are defined as follows :

`aaa authentication login use-radius radius local` configures the SWITCH to use RADIUS for authentication at the login prompt. If RADIUS returns an error, the user is authenticated using the local database. In this example, `use-radius` is the name of the method list, which specifies RADIUS and then local authentication.

### 9.5.2 RADIUS Application in AAA

The following example shows a general configuration using RADIUS with the AAA command set:

```
radius-server host 1.2.3.4
radius-server key myRaDiUSpassWoRd
username root password AlongPassword
aaa authentication login admins group radius local
line vty 1 16
login authentication admins
```

The meaning of each command line is shown below:

`radius-server host` is used to define the IP address of the RADIUS server.

`radius-server key` is used to define the shared key between network access server and RADIUS server.

`aaa authentication login admins group radius local` command defines the authentication method list "admins," which specifies that RADIUS authentication and then (if the RADIUS server does not respond) local authentication will be used on serial lines using PPP.

`login authentication admins` is used to designate to apply the admins method list during login.

# Chapter 10 TACACS+ Configuration

## 10.1 TACACS+ Overview

As an access security control protocol, TACACS+ provides the centralized verification of acquiring the network access server's access right for users. . The communication's safety is guaranteed because the information exchange between network access server and TACACS+ service program is encrypted

Before using TACACS+ configured on network access server, TACACS+'s server has to be accessed and configured. TACACS+ provides independent modularized authentication, authorization and accounting.

Authentication—supporting multiple authentication ways (ASCII, PAP, CHAP and etc), provides the ability of processing any conversation with users (for example, bringing forward probing questions like family address, service type, ID number and etc. after providing login username and password). Moreover, TACACS+ authentication service supports sending information to user's screen, like sending information to notify user that their password has to be changed because of the company's password aging policy.

Authorization—detailed controlling of user's service limitation during service time, including setting up automatic commands, access control, dialog continuing time and etc. It can also limit the command enforcement which user might execute.

Accounting—collecting and sending the information of creating bills, auditing, or counting the usage status of network resources. Network manager can use accounting ability to track user's activities for security auditing or provide information for user's bills. The accounting function keeps track of user authentication, beginning and starting time, executed commands, packets' quantity and bytes' quantities, and etc.

### 10.1.1 The Operation of TACACS+ Protocol

## Authentication in ASCII Form

When user logs in network access server which uses TACACS+, and asking for simple authentication in ASCII form, the following process might happen under typical circumstances:

When the connection is built up, network access server communicates with TACACS+ service program to acquire username prompt, and then gives it to user. User enters username, and network access server communicates with TACACS+ service program again to acquire password prompt. It shows password prompt to user. User enters password and then the password is sent to TACACS+ service program.

**Note:**

TACACS+ allows any dialogues between server's program and user until it collects enough information to identify user. Normally it is accomplished by the combination of prompting username and password, but it can also include other items, like ID number. All of these are under the control of TACACS+ server's program.

Network access server finally gets one of the following responses from TACACS+ server:

<b>ACCEPT</b>	User passes authentication, and service begins. If network access server is configured as requiring service authorization, authorization begins at this moment.
<b>REJECT</b>	User does not pass authentication. User might be rejected for further access or prompted to access again. It depends on the treatment of TACACS+ server.
<b>ERROR</b>	Error happens during authentication, and the cause might be at server. It also might happen at the network connection between server and network access server. If ERROR response is received, normally network access tries another way to identify user.
<b>CONTINUE</b>	It prompts user to enter additional authentication information.

## Authentication in PAP and CHAP Ways

PAP login is similar with ASCII login, but the difference is that username and password of network access server is in PAP message not entered by user, thus it would not prompt user to enter relative information. CHAP login is similar in the main parts. After authentication, user need to enter authorization stage if network access server asks for the authorization for user. But before TACACS+ authorization is handled, TACACS+ authentication has to be finished.

If TACACS+ authorization needs to be processed, it needs to contact with TACACS+ server program again and go back to the authorization response of ACCEPT or REJECT. If back to ACCEPT, AV (attribute-value) for data, which is used for specifying the user's EXEC or NETWORK dialogue and confirming services which user can access, might be included.

### 10.2 TACACS+ Configuration Process

In order to configure as supporting TACACS+, the following tasks must be processed:

Using command `tacacs-server` to assign one or multiple IP addresses of TACACS+ server. Using command `tacacs key` to assign encrypted secret key for all the exchanged information between network access server and TACACS+ server. The same secret key has to be configured in TACACS+ server program.

Use the global configuration command `aaa authentication` to define the method table which uses TACACS+ to do authentication. More information about command `aaa authentication`, please refer to "Authentication Configuration".

Use commands `line` and `interface` to apply the defined method table on interfaces or lines. More relative information, please refer to "Authentication Configuration".

### 10.3 TACACS+ Configuration Task List

- Assigning TACACS+ server
- Setting up TACACS+ encrypted secret key
- Assigning to use TACACS+ for authentication
- Assigning to use TACACS+ for authorization
- Assigning to use TACACS+ for accounting

### 10.4 TACACS+ Configuration Task

#### 10.4.1 Assigning TACACS+ Server

Command `Tacacs-server` could help to assign the IP address of TACACS+ server. Because TACACS+ searching host in the configured order, this characteristic is useful for servers which configured with different priorities. In order to assign TACACS+ host, use the following commands under global configuration mode:

Command	Purpose
<code>tacacs-server host ip-address</code> <code>[single-connection] multi-connection</code> <code>[port integer] [timeout integer] [key string]</code>	To assign the IP address of TACACS+ server and relative features.

Use command `tacacs-server` to configure the following as well:

- Use single-connection key word to assign the adoption of single connection. This would allow server program to deal with more TACACS+ operations and be more efficient. multi-connection means the adoption of multiple TCP connection.
- Use parameter `port` to assign TCP interface number which is used by TACACS+ server program. The default interface number is 49.
- Use parameter `timeout` to assign the time's upper limit ( taken second as the unit) for SWITCH's waiting response from server.
- Use parameter `key` to assign the encrypted and decrypted secret keys for messages.

**Note:**

Connect host after using `tacacs-server`, and connect the timeout value defined by command `timeout` to cover the global timeout value configured by command `tacacs-server timeout`. Use the encrypted secret key assigned by `tacacs-server` to cover the default secret key configured by global configuration command `tacacs-server key`. Therefore, this command could be used to configure the unique TACACS+ connection to enhance the network security.

## 10.4.2 Setting up TACACS+ Encrypted Secret Key

In order to set up the encrypted secret key of TACACS+ message, use the following command under the global configuration mode:

Command	Purpose
<code>tacacs-server key <i>keystring</i></code>	To set up the encrypted secret key matched with the encrypted secret key used by TACACS+ server.

**Note:**

In order to encrypt successfully, the same secret key should also be configured for TACACS+ server program.

## 10.4.3 Assigning to Use TACACS+ for Authentication

After having marked the TACACS+ server and defined its related encrypted secret key, method table need to be defined for TACACS+ authentication. Because TACACS+ authentication is by AAA, command `aaa authentication` should be assigned as TACACS+'s authentication way. More information, please refer to "Authentication Configuration".

## 10.4.4 Assigning to Use TACACS+ for Authorization

AAA authorization could help to set up parameter to confine user's network access limitation. TACACS+ authorization could be applied to services like command, network connection, EXEC dialogue and etc. Because TACACS+ authorization is by AAA, command `aaa authorization` should be assigned as TACACS+'s authentication way. More information, please refer to "Authorization Configuration".

## 10.4.5 Assigning to Use TACACS+ for Accounting

AAA accounting is able to track user's current service and their consumed network resources' quantity. Because TACACS+ authorization is by AAA, command `aaa accounting` should be assigned as TACACS+'s accounting way. More information, please refer to "Accounting Configuration".

## 10.5 TACACS+ Configuration Example

This chapter includes the following TACACS+ configuration example.

### 10.5.1 TACACS+ Authentication Examples

The following configuring login authentication is accomplished by TACACS+:

```
aaa authentication login test group tacacs+ local
tacacs -server host 1.2.3.4
tacacs-server key testkey
line vty 0
login authentication test
```

In this example:

Command `aaa authentication` defines the authentication method table `test` used on `vtty0`. Key word `tacacs+` means the authentication is processed by TACACS+, and if TACACS+ does not respond during authentication, key word `local` indicates to use the local database on the network access server to do authentication.

Command `tacacs-server host` marks TACACS+ server's IP address as `1.2.3.4`. command `tacacs-server key` defines the shared encrypted secret key as `testkey`.

The following example is the security protocol used when configuring TACACS+ as login authentication, with the usage of method table default not test:

```
aaa authentication login default group tacacs+ local
tacacs-server host 1.2.3.4
tacacs-server key goaway
```

In this example:

Command `aaa authentication` defines the default authentication method table `default` during login authentication. If authentication required, keyword `tacacs+` means authentication is by TACACS+. If TACACS+ does not respond, keyword `local` indicates to use the local database on the network access server for authentication.

Command `tacacs-server host` marks TACACS+ server program's IP address as `1.2.3.4`. Command `tacacs-server key` defines the shared encrypted secret key as `goaway`.

### 10.5.2 TACACS+ Authorization Examples

```
aaa authentication login default group tacacs+ local
aaa authorization exec default group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
```

In this example:

Command `aaa authentication` defines the default authentication method table `default` during login authentication. If authentication required, keyword `tacacs+` means authentication is by TACACS+. If TACACS+ does not respond, keyword `local` indicates to use the local database on the network access server for authentication.

Command `aaa authorization` does network service authorization by TACACS+.

Command `tacacs-server host` marks TACACS+ server's IP as `10.1.2.3`. Command `tacacs-server key` defines the shared encrypted secret key as `goaway`.

## 10.5.3 TACACS+ Accounting Examples

The following configuration of login authentication's method table uses TACACS+ as one of the methods to configure the accounting by TACACS+:

```
aaa authentication login default group tacacs+ local
aaa accounting exec default start-stop group tacacs+
tacacs-server host 10.1.2.3
tacacs-server key goaway
```

In this example:

Command `aaa authentication` defines the default authentication method table default during login authentication. If authentication required, keyword `tacacs+` means authentication is by TACACS+. If TACACS+ does not respond, keyword `local` indicates to use the local database on the network access server for authentication.

Command `aaa accounting` does accounting of network service by TACACS+. In this example, the relative information of starting and beginning time is accounted and sent to TACACS+ server.

Command `tacacs-server host` marks TACACS+ server's IP address as 10.1.2.3. command `Command tacacs-server key` defines the shared encrypted secret key as goaway.

# Chapter 11 HTTP Switch Configuration

## 11.1 HTTP Configuration

Switch configuration can be conducted not only through command lines and SNMP but also through Web browser. The switches support the HTTP configuration, the abnormal packet timeout configuration, and so on.

### 11.1.1 Choosing the Prompt Language

Up to now, switches support two languages, that is, English and Chinese, and the two languages can be switched over through the following command.

Command	Purpose
<code>ip http language {chinese   english}</code>	Sets the prompt language of Web configuration to <b>Chinese</b> or <b>English</b> .

### 11.1.2 Setting the HTTP Port

Generally, the HTTP port is port 80 by default, and users can access a switch by entering the IP address directly; however, switches also support users to change the service port and after the service port is changed you have to use the IP address and the changed port to access switches. For example, if you set the IP address and the service port to **192.168.1.3** and **1234** respectively, the HTTP access address should be changed to **http:// 192.168.1.3:1234**. You'd better not use other common protocols' ports so that access collision should not happen. Because the ports used by a lot of protocols are hard to remember, you'd better use port IDs following port 1024.

Command	Purpose
<code>ip http port { portNumber }</code>	Sets the HTTP port.

### 11.1.3 Enabling the HTTP Service

Switches support to control the HTTP access. Only when the HTTP service is enabled can HTTP exchange happen between switch and PC and, when the HTTP service is closed, HTTP exchange stops.

Command	Purpose
<code>ip http server</code>	Enables the HTTP service.
<code>ip http {timeout}</code>	Configures the timeout time of HTTP abnormal packets.

### 11.1.4 Setting the HTTP Access Mode

You can access a switch through two access modes: HTTP access and HTTPS access, and you can use the following command to set the access mode to **HTTP**.

Command	Purpose
<code>ip http http-access enable</code>	Sets the HTTP access mode.

### 11.1.5 Setting the Maximum Number of VLAN Entries on Web Page

A switch supports at most 4094 VLANs and in most cases Web only displays parts of VLANs, that is, those VLANs users want to see. You can use the following command to set the maximum number of VLANs. The default maximum number of VLANs is 100.

Command	Purpose
<code>ip http web max-vlan { max-vlan }</code>	Sets the maximum number of VLAN entries displayed in a web page.

### 11.1.6 Setting the Maximum Number of Multicast Entries Displayed on a Web Page

A switch supports at most 100 multicast entries. You can run the following command to set the maximum number of multicast entries and Web then shows these multicast entries. The default maximum number of multicast entries is 15.

Command	Purpose
<code>ip http web igmp-groups { igmp-groups }</code>	Sets the maximum number of multicast entries displayed in a web page.

## 11.2 HTTPS Configuration

In order to improve the security of communications, switches support not only the HTTP protocol but also the HTTPS protocol. HTTPS is a security-purposed HTTP channel and it is added to the SSL layer under HTTP.

### 11.2.1 Setting the HTTP Access Mode

You can run the following command to set the access mode to **HTTPS**.

Command	Purpose
<code>ip http ssl-access enable</code>	Sets the HTTPS access mode.

### 11.2.2 It is used to set the HTTPS port.

As the HTTP port, HTTPS has its default service port, port 443, and you also can run the following command to change its service port. It is recommended to use those ports following port 1024 so as to avoid collision with other protocols' ports.

Parameter	Remarks
<code>ip http secure-port {portNumber}</code>	Sets the HTTPS port.

# Chapter 12 Configuration Preparation

## 12.1 Accessing the Switch Through HTTP

When accessing the switch through Web, please make sure that the applied browser complies with the following requirements:

- HTML of version 4.0
- HTTP of version 1.1
- JavaScript™ of version 1.5

What's more, please ensure that the main program file, running on a switch, supports Web access and your computer has already connected the network in which the switch is located.

### 12.1.1 Initially Accessing the Switch

When the switch is initially used, you can use the Web access without any extra settings:

1. Modify the IP address of the network adapter and subnet mask of your computer to **192.168.0.1** and **255.255.255.0** respectively.
2. Open the Web browser and enter **192.168.0.1** in the address bar. It is noted that **192.168.0.1** is the default management address of the switch.
3. If the Internet Explorer browser is used, you can see the dialog box in figure 1. Both the original username and the password are “admin”, which is capital sensitive.

Figure 1: ID checkup of WEB login

4. After successful authentication, the systematic information about the switch will appear on the IE browser.

### 12.1.2 Upgrading to the Web-Supported Version

If your switch is upgraded to the Web-supported version during its operation and the switch has already stored

its configuration files, the Web visit cannot be directly applied on the switch. Perform the following steps one by one to enable the Web visit on the switch:

1. Connect the console port of the switch with the accessory cable, or telnet to the management address of the switch through the computer.
2. Enter the global configuration mode of the switch through the command line, the DOS prompt of which is similar to "Switch\_config#".
3. If the management address of the switch is not configured, please create the VLAN interface and configure the IP address.
4. Enter the **ip http server** command in global configuration mode and start the Web service.
5. Run **username** to set the username and password of the switch. For how to use this command, refer to the "Security Configuration" section in the user manual.

After the above-mentioned steps are performed, you can enter the address of the switch in the Web browser to access the switch.

6. Enter **write** to store the current configuration to the configuration file.

## 12.2 Accessing a Switch Through Secure Links

The data between the WEB browser and the switch will not be encrypted if you access a switch through common HTTP. To encrypt these data, you can use the secure links, which are based on the secure sockets layer, to access the switch.

To do this, you should follow the following steps:

1. Connect the console port of the switch with the accessory cable, or telnet to the management address of the switch through the computer.
2. Enter the global configuration mode of the switch through the command line, the DOS prompt of which is similar to "Switch\_config#".
3. If the management address of the switch is not configured, please create the VLAN interface and configure the IP address.
4. Enter the **ip http server** command in global configuration mode and start the Web service.
5. Run **username** to set the username and password of the switch. For how to use this command, refer to the "Security Configuration" section in the user manual.
6. Run **ip http ssl-access enable** to enable the secure link access of the switch.
7. Run **no ip http http-access enable** to forbid to access the switch through insecure links.
8. Enter **write** to store the current configuration to the configuration file.
9. Open the WEB browser on the PC that the switch connects, enter <https://192.168.0.1> on the address bar (192.168.0.1 stands for the management IP address of the switch) and then press the **Enter** key. Then the switch can be accessed through the secure links.

## 12.3 Introduction of Web Interface

The Web homepage appears after login, as shown in figure 2:

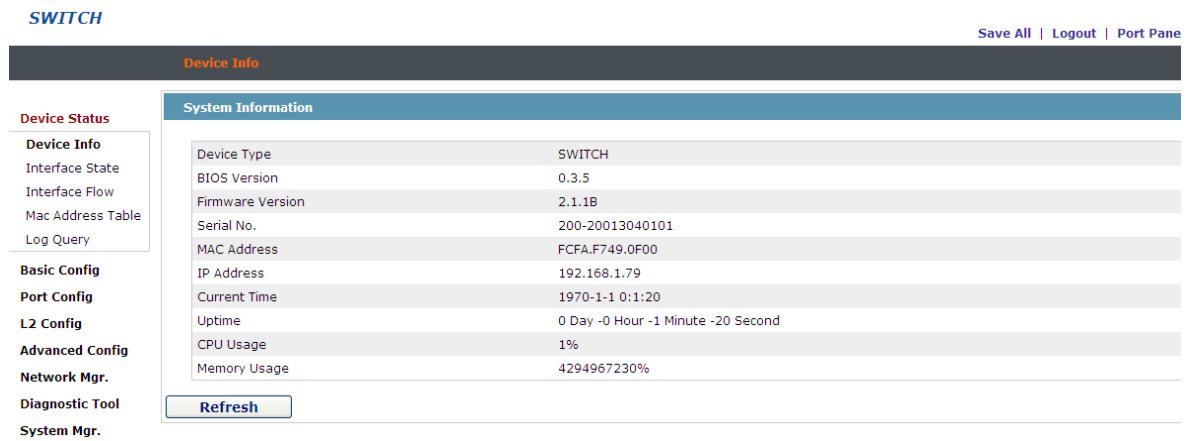

Figure 2: Web homepage

The whole homepage consists of the top control bar, the navigation bar, the configuration area and the bottom control bar.

### 12.3.1 Top Control Bar

Figure 3: Top control bar

Save All	Write the current settings to the configuration file of the device. It is equivalent to the execution of the <b>write</b> command. The configuration that is made through Web will not be promptly written to the configuration file after validation. If you click "Save All", the unsaved configuration will be lost after rebooting.
English	The interface will turn into the English version.
Chinese	The interface will turn into the Chinese version.
Logout	Exit from the current login state. After you click "logout", you have to enter the username and the password again if you want to continue the Web function.

After you configure the device, the result of the previous step will appear on the left side of the top control bar. If error occurs, please check your configuration and retry it later.

## 12.3.2 Navigation Bar

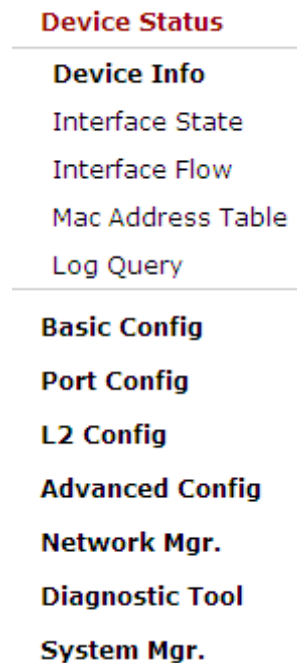

Figure 4 Navigation bar

The contents in the navigation bar are shown in a form of list and are classified according to types. By default, the list is located at “Runtime Info”. If a certain item need be configured, please click the group name and then the sub-item. For example, to browse the flux of the current port, you have to click “Interface State” and then “Interface Flow”.

**Note:**

The limited user can only browse the state of the device and cannot modify the configuration of the device. If you log on to the Web with limited user’s permissions, only “Interface State” will appear.

## 12.3.3 Configuration Area

System Information	
Device Type	SWITCH
BIOS Version	0.3.5
Firmware Version	2.1.1B
Serial No.	200-20013040101
MAC Address	FCFA:F749:0F00
IP Address	192.168.1.79
Current Time	1970-1-1 0:1:20
Uptime	0 Day -0 Hour -1 Minute -20 Second
CPU Usage	1%
Memory Usage	4294967230%

[Refresh](#)

Figure 5 Configuration Area

The configuration display area shows the state and configuration of the device. The contents of this area can

be modified by the clicking of the items in the navigation bar.

### 12.3.4 Bottom Control Bar

Figure 6: Bottom control bar

If you click the **About** button on the top control bar, the bottom control bar appears. The main function of the bottom control bar is to realize the automatic refreshing of the configuration display area. For example, if you click “Interface Flow” in the navigation bar and then click “Refresh”, the flow of the interface can be continuously monitored.

After you click “Refresh”, the countdown of the next-time refresh will appear on the left side. You can modify the countdown settings by clicking the dropdown list.

---

**Note:**

The smaller the countdown value is set, that is, the higher the frequency is, the higher the CPU usage is.

---

### 12.3.5 Configuration Area

The configuration area is to show the content that is selected in the navigation area. The configuration area always contains one or more buttons, and their functions are listed in the following table:

Refresh	Refresh the content shown in the current configuration area.
Apply	Apply the modified configuration to the device. The application of the configuration does not mean that the configuration is saved in the configuration file. To save the configuration, you have to click “Save All” on the top control bar.
Reset	Means discarding the modification of the sheet. The content of the sheet will be reset.
New	Creates a list item. For example, you can create a VLAN item or a new user.
Delete	Deletes an item in the list.
Back	Go back to the previous-level configuration page.

# Chapter 13 Basic Configuration

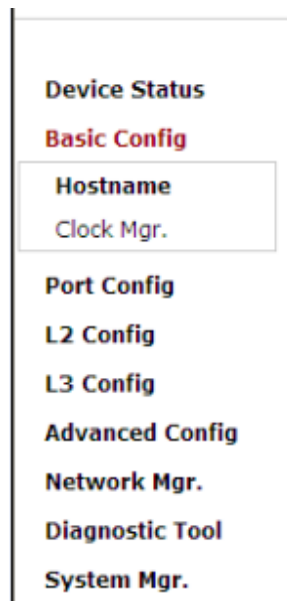

Figure 1 A list of basic configuration

## 13.1 Hostname Configuration

If you click **Basic Config -> Hostname Config** in the navigation bar, the **Hostname Configuration** page appears, as shown in figure 3.

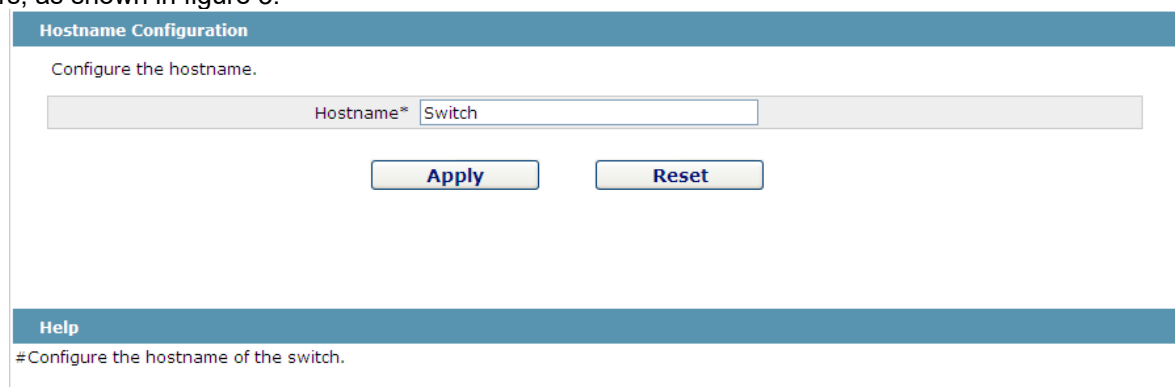

Figure 3 Hostname configuration

The hostname will be displayed in the login dialog box.

The default name of the device is “Switch”. You can enter the new hostname in the text box shown in figure 3 and then click “Apply”.

## 13.2 Time Management

If you click **System Manage -> Time Manage**, the **Time Setting** page appears.

**Time Setting**

System Time

Select Time-Zone

Set Time Manually

Set Time  Year  Month  Day  Hour  Minute(s)  Second

Network Time Synchronization

SNTP Server One	<input type="text"/>
SNTP Server Two	<input type="text"/>
SNTP Server Three	<input type="text"/>
Synchronization Interval	<input type="text" value="1"/> Minute(s)

Figure 4 Clock management

To refresh the clock of the displayed device, click “Refresh”.

In the “Select Time-Zone” dropdown box select the time zone where the device is located. When you select “Set Time Manually”, you can set the time of the device manually. When you select “Network Time Synchronization”, you can designate 3 SNTP servers for the device and set the interval of time synchronization.

# Chapter 14 Configuration of the Physical Interface

Figure 1: Physical port configuration list

## 14.1 Configuring Port Description

If you click **Physical port config -> Port description Config** in the navigation bar, the **Port description Configuration** page appears, as shown in figure 2.

Port	Port Description
G0/1	<input type="text"/>
G0/2	<input type="text"/>
G0/3	<input type="text"/>
G0/4	<input type="text"/>

Figure 2: Port description configuration

You can modify the port description on this page and enter up to 120 characters. The description of the VLAN port cannot be set at present.

## 14.2 Configuring the Attributes of the Port

If you click **Physical port config -> Port attribute Config** in the navigation bar, the **Port Attribute Configuration** page appears, as shown in figure 3.

Port	Status	Speed	Duplex	Flow Control	Medium
G0/1	Up	Auto	Auto	Off	Auto
G0/2	Up	Auto	Auto	Off	Auto
G0/3	Up	Auto	Auto	Off	Auto
G0/4	Up	Auto	Auto	Off	Auto
G0/5	Up	Auto	Auto	Off	Auto
G0/6	Up	Auto	Auto	Off	Auto
G0/7	Up	Auto	Auto	Off	Auto
G0/8	Up	Auto	Auto	Off	Auto
G0/9	Up	Auto	Auto	Off	Auto
G0/10	Up	Auto	Auto	Off	Auto

Figure 3 Configuring the port attributes

On this page you can modify the on/off status, rate, duplex mode, flow control status and medium type of a port.

Note:

1. The Web page does not support the speed and duplex mode of the fast-Ethernet port.
2. After the speed or duplex mode of a port is modified, the link state of the port may be switched over and the network communication may be impaired.

### 14.3 Rate control

If you click **Physical port Config -> Port rate-limit Config** in the navigation bar, the **Port rate limit** page appears, as shown in figure 4.

Port	Receive Status	Receive Speed Unit	Receive Speed	Send Status	Send Speed Unit	Send Speed
G0/1	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/2	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/3	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/4	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/5	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/6	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/7	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/8	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/9	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)
G0/10	Disable	64kbps	(1-15625)	Disable	64kbps	(1-15625)

Figure 4: Port's rate limit

On this page you can set the reception speed and transmission speed of a port. By default, all ports have no speed limited.

### 14.4 Port mirroring

If you click **Physical port Config -> Port Mirror** in the navigation bar, the **Port Mirror Config** page appears, as shown in figure 4-5.

Mirror Port G0/1

Filters Port Type: All Slot Num: All Name(s): Help

Mirrored Port	Mirror Mode
<input type="checkbox"/> G0/1	RX
<input checked="" type="checkbox"/> G0/2	TX

Figure 4-5 Port mirror configuration

Click the dropdown list on the right side of "Mirror Port" and select a port to be the destination port of mirror.  
 Click a checkbox and select a source port of mirror, that is, a mirrored port.

- RX                      The received packets will be mirrored to the destination port.
- TX                        The transmitted packets will be mirrored to a destination port.
- RX & TX                The received and transmitted packets will be mirrored simultaneously.

## 14.5 Loopback Detection

If you click **Physical port Config -> Port loopback detection** in the navigation bar, the **Setting the port loopback detection** page appears, as shown in figure 4-6.

Port	Status	Keepalive Period
G0/1	Enable <input type="button" value="v"/>	3333 (0-32767)Seconds

Figure 4-6: Port loopback detection

You can set the loopback detection cycle on the **Loopback Detection** page.

## 14.6 Port security

### 14.6.1 IP Binding Configuration

If you click **Physical port Config -> Port Security -> IP bind** in the navigation bar, the **Configure the IP-Binding Info** page appears, as shown in figure 4-7.

Interface Name	Detail
G0/1	<a href="#">Detail</a>

Figure 4-7 IP binding configuration

Click "Detail" and then you can conduct the binding of the source IP address for each physical port. In this way, the IP address that is allowed to visit the port will be limited.

	Serial number	Address	Operate
<input type="checkbox"/>	1	192.168.0.2	<a href="#">Edit</a>
<input type="checkbox"/>	2	192.168.0.3	<a href="#">Edit</a>

Figure 4-8 Setting the binding of the source IP address

### 14.6.2 MAC Binding Configuration

If you click **Physical port Config -> Port Security -> MAC bind** in the navigation bar, the **Configure the MAC-Binding Info** page appears, as shown in figure 4-10.

Interface Name	Detail
G0/1	<a href="#">Detail</a>

Figure 4-9 MAC binding configuration

Click "Detail" and then you can conduct the binding of the source MAC address for each physical port. In this

way, the MAC address that is allowed to visit the port will be limited.

	Serial number	Address	Operate
<input type="checkbox"/>	1	1234.1234.1234	<a href="#">Edit</a>
<input type="checkbox"/>	2	1234.1234.1235	<a href="#">Edit</a>

Figure 4-10 Setting the binding of the source MAC address

### 14.6.3 Setting the Static MAC Filtration Mode

If you click **Physical port Config -> Port Security -> Static MAC filtration mode** in the navigation bar, the **Configure the static MAC filtration mode** page appears, as shown in figure 4-11.

Interface Name	Port Mode	Static MAC Filtration Mode
G0/1	Access	Disable <input type="button" value="v"/>

Figure 4-11: Setting the static MAC filtration mode

On this page you can set the static MAC filtration mode. By default, the static MAC filter is disabled. Also, the static MAC filter mode cannot be set on ports in trunk mode.

### 14.6.4 Static MAC Filtration Entries

If you click **Physical port Config -> Port security -> Static MAC filtration entries** in the navigation bar, the **Setting the static MAC filtration entries** page appears.

Interface Name	Detail
G0/1	<a href="#">Detail</a>

Figure 4-12: Static MAC filtration entry list

If you click "Detail", you can conduct the binding of the source MAC address for each physical port. According to the configured static MAC filtration mode, the MAC address of a port can be limited, allowed or forbidden to visit.

	Serial number	Filtration Mode	MAC Address	Operate
<input type="checkbox"/>	1	Disable	0001.0002.0003	<a href="#">Edit</a>

Figure 4-13: Setting static MAC filtration entries

### 14.6.5 Setting the Dynamic MAC Filtration Mode

If you click **Physical port Config -> Port Security -> Dynamic MAC filtration mode** in the navigation bar, the **Configure the dynamic MAC filtration mode** page appears, as shown in figure 4-14.

Interface Name	Dynamic MAC Filtration Mode	Max MAC Address
G0/1	Disable <input type="button" value="v"/>	<input type="text" value="1"/> (1-4095)

Figure 4-14: Setting the dynamic MAC filtration mode

You can set the dynamic MAC filtration mode and the allowable maximum number of addresses on this page. By default, the dynamic MAC filtration mode is disabled and the maximum number of addresses is 1.

## 14.7 Storm control

In the navigation bar, click **Physical port Config -> Storm control**. The system then enters the page, on which the broadcast/multicast/unknown unicast storm control can be set.

### 14.7.1 Broadcast Storm Control

Port	Status	Threshold
G0/1	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/2	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/3	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/4	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/5	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/6	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/7	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS

Figure 5 Broadcast storm control

Through the dropdown boxes in the **Status** column, you can decide whether to enable broadcast storm control on a port. In the **Threshold** column you can enter the threshold of the broadcast packets. The legal threshold range for each port is given behind the threshold.

### 14.7.2 Multicast Storm Control

G0/38	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/39	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/40	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/41	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/42	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/43	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/44	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/45	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/46	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/47	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
G0/48	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/1	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/2	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/3	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/4	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/5	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/6	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/7	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS
T1/8	Disable <input type="button" value="v"/>	<input type="text"/> (1-1638400) 100PPS

Apply

Reset

Figure 6 Setting the broadcast storm control

Through the dropdown boxes in the **Status** column, you can decide whether to enable multicast storm control on a port. In the **Threshold** column you can enter the threshold of the multicast packets. The legal threshold range for each port is given behind the threshold.

### 14.7.3 Unknown Unicast Storm Control

G0/39	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/40	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/41	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/42	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/43	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/44	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/45	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/46	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
G0/47	Disable <input type="button" value="v"/>		(1-1638400) 100PPS

T1/2	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/3	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/4	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/5	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/6	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/7	Disable <input type="button" value="v"/>		(1-1638400) 100PPS
T1/8	Disable <input type="button" value="v"/>		(1-1638400) 100PPS

Figure 7 Unknown unicast storm control

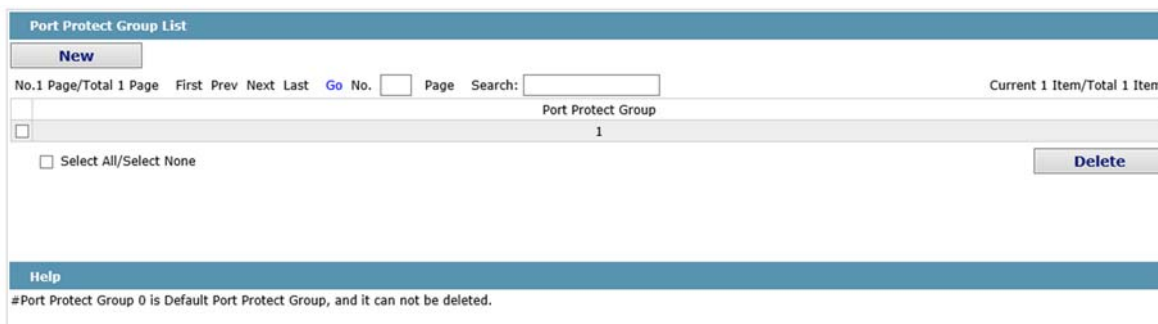

In the **Threshold** column you can enter the threshold of the broadcast packets. The legal threshold range for each port is given behind the threshold.

## 14.8 Port Protect Group Configuration

Click "Port Config" -> "Port Protect Group Config" in the navigation bar, and enter the configuration page of Port Protect Group List and Port Protect Group Interface Config.

### 14.8.1 Port Protect Group List

Click "Port Config" -> "Port Protect Group Config" -> "Port Protect Group List" in the navigation bar, and enter the configuration page of "Port Protect Group List".

Click “New” to create a new port protect group, as shown in the above figure.

Tick one port protect group and delete it. The port protect group is 0 by default, which cannot be deleted.

## 14.8.2 Port Protect Group Interface Configuration

Click "Port Config" -> “Port Protect Group Config” -> “Port Protect Group Interface Config” in the navigation bar, and enter the configuration page of “Port Protect Group Interface Config”.

Port	Port Protect Group
g0/1	<input type="text"/>
g0/2	<input type="text"/>

The port protect group must be a created group. If one port has configured the default protect group, other ports can only be configured with the default protect group.

## 15.1 VLAN Settings

### 15.1.1 VLAN List

If you click **Layer-2 Config** -> **VLAN Config** in the navigation bar, the **VLAN Config** page appears, as shown in figure 2.

	VLAN ID	VLAN Name	Operate
<input type="checkbox"/>	1	Default	<a href="#">Edit</a>

Figure 2 VLAN configuration

The VLAN list will display VLAN items that exist in the current device according to the ascending order. In case of lots of items, you can look for the to-be-configured VLAN through the buttons like “Prev”, “Next” and “Search”.

You can click “New” to create a new VLAN.

You can also click “Edit” at the end of a VLAN item to modify the VLAN name and the port’s attributes in the VLAN.

If you select the checkbox before a VLAN and then click “Delete”, the selected VLAN will be deleted.

**Note:**

By default, a VLAN list can display up to 100 VLAN items. If you want to configure more VLANs through Web, please log on to the switch through the Console port or Telnet, enter the global configuration mode and then run the “**ip http web max-vlan**” command to modify the maximum number of VLANs that will be displayed.

## 15.1.2 VLAN Settings

If you click “New” or “Edit” in the VLAN list, the VLAN configuration page appears, on which new VLANs can be created or the attributes of an existent VLAN can be modified.

Port	Default VLAN	Mode	Untag or not	Allow or not
G0/1	1 <1-4094>	Access	No	Yes
G0/2	1 <1-4094>	Access	No	Yes
G0/3	1 <1-4094>	Access	No	Yes
G0/4	1 <1-4094>	Access	No	Yes
G0/5	1 <1-4094>	Access	No	Yes
G0/6	1 <1-4094>	Access	No	Yes
G0/7	1 <1-4094>	Access	No	Yes
G0/8	1 <1-4094>	Access	No	Yes
G0/9	1 <1-4094>	Access	No	Yes
G0/10	1 <1-4094>	Access	No	Yes
G0/11	1 <1-4094>	Access	No	Yes
G0/12	1 <1-4094>	Access	No	Yes

Figure 3 Revising VLAN configuration

If you want to create a new VLAN, enter a VLAN ID and a VLAN name; the VLAN name can be null.

Through the port list, you can set for each port the default VLAN, the VLAN mode (Trunk or Access), whether to allow the entrance of current VLAN packets and whether to execute the untagging of the current VLAN when the port works as the egress port.

**Note:**

When a port in Trunk mode serves as an egress port, it will untag the default VLAN by default.

## 15.2 GVRP Configuration

### 15.2.1 GVRP Global Attribute Configuration

If you click **Layer-2 Config -> GVRP Config -> GVRP Global Config** in the navigation bar, the **GVRP**

**Global Config** page appears, as shown the following Figure.

GVRP Global Config	
GVRP Global Config	Disable
Set Dynamic Vlan to Take Effect Only On Registration Ports	Disable

**Apply**      **Reset**

Figure 9 GVRP Global Configuration

You can enable or disable the global GVRP protocol and sets whether the dynamic vlan is only effective on the registration interface.

## 15.2.2 Global Interface Attribute Configuration

If you click **Layer-2 Config -> GVRP Config -> GVRP Interface Config** in the navigation bar, the **GVRP Interface Config** page appears, as shown the following Figure.

Port	GVRP Status
G0/1	Enable

Figure 10 Global Interface Attribute Configuration

To enable or disable GVRP protocol on the GVRP interface configuration.

## 15.3 STP Configuration

### 15.3.1 STP Status Information

If you click **Layer-2 Config -> STP Config** in the navigation bar, the **STP Config** page appears, as shown in figure 10.

**Root STP Config**

Spanning Tree Priority	4096
MAC Address	00E0.0F8E.7025
Hello Time	2
Max Age	20
Forward Delay	15

**Local STP Config**

Protocol Type	RSTP
Spanning Tree Priority	32768
MAC Address	FCFA.F72E.09A1
Hello Time	2 (1-10)s
Max Age	20 (6-40)s
Forward Delay	15 (4-30)s
BPDU Terminal	Disable

**STP Port's State**

No.1 Page/Total 1 Page    First Prev Next Last    Go No.  Page    Search:     Current 1 Item/Total 1 Item

Interface	Role	State	Cost	Priority.Port ID	Type
G0/1	Root	FWD	20000	128.1	P2p

Figure 10 Configuring the global attributes of STP

The root STP configuration information and the STP port's status are only-read.

On the local STP configuration page, you can modify the running STP mode by clicking the Protocol type dropdown box. The STP modes include STP, RSTP and disabled STP.

The priority and the time need be configured for different modes.

**Note:**

The change of the STP mode may lead to the interruption of the network.

### 15.3.2 Configuring the Attributes of the STP Port

If you click the "Configure RSTP Port" option, the "Configure RSTP Port" page appears.

Port	Protocol Status	Priority(0~240)	Path-Cost(0~200000000)	Edge Port Property
G0/1	Enable	128	0	Auto
G0/2	Enable	128	0	Auto
G0/3	Enable	128	0	Auto
G0/4	Enable	128	0	Auto
G0/5	Enable	128	0	Auto
G0/6	Enable	128	0	Auto
G0/7	Enable	128	0	Auto
G0/8	Enable	128	0	Auto

Figure 11 Configuring the attributes of RSTP

The configuration of the attributes of the port is irrelative of the global STP mode. For example, if the protocol status is set to "Disable" and the STP mode is also changed, the port will not run the protocol in the new mode. The default value of the path cost of the port is 0, meaning the path cost is automatically calculated according to the speed of the port. If you want to change the path cost, please enter another value.

## 15.4 IGMP-Snooping Configuration

### 15.4.1 IGMP-Snooping Configuration

If you click **Layer-2 Config -> IGMP snooping**, the IGMP-Snooping configuration page appears.

IGMP Snooping Config	
Multicast Filtration Mode	Transfer Unknown
IGMP Snooping	Enable
Enable Auto Query	Enable

Apply

Figure 12 IGMP-snooping configuration

On this page you can set whether to make a switch to forward unknown multicasts, whether to enable IGMP snooping, and whether to configure the switch as the querier of IGMP.

### 15.4.2 IGMP-Snooping VLAN List

If you click **Layer-2 Config -> IGMP snooping vlan list**, the **IGMP-Snooping VLAN list** page appears.

	VLAN ID	Status of the IGMP Snooping Vlan	Immediate-leave	Multicast Router's Port	Operate
<input type="checkbox"/>	1	Running	Disable	SWITCH(querier);	Edit

Figure 13: IGMP-snooping VLAN list

If you click **New**, IGMP-snooping VLAN configuration can be done. Through Web up to 8 physical ports can be set on each IGMP snooping VLAN. If you click **Cancel**, a selected IGMP-Snooping VLAN can be deleted; if you click **Edit**, you can modify the member port, running status and immediate-leave of IGMP-Snooping VLAN.

<b>VLAN ID</b>	2
<b>Status of the IGMP Snooping Vlan</b>	Enable
<b>Immediate-leave</b>	Disable

Figure 14: Static routing port of IGMP VLAN

When an IGMP-Snooping VLAN is created, its VLAN ID can be modified; but when the IGMP-Snooping VLAN is modified, its VLAN ID cannot be modified.

You can click “>>” and “<<” to delete and add a routing port.

### 15.4.3 Static Multicast Address

If you click **Static multicast address**, the **Setting the static multicast address** page appears.

The screenshot shows the 'Static Multicast Address Config' page. It has three input fields: 'VLAN ID', 'Multicast IP Address', and 'Assignment Port'. Below these is an 'Apply' button. The second part of the screenshot is the 'Static Multicast List Info' section. It includes a table with columns 'VLAN ID', 'Group', and 'Port'. Above the table are navigation controls: 'No.0 Page/Total 0 Page', 'First Prev Next Last', 'Go No. [ ] Page', and 'Search: [ ]'. Below the table is a 'Select All/Select None' checkbox and 'Delete' and 'Refresh' buttons.

Figure 15 Multicast List

On this page, the currently existing static multicast groups and port groups in each static multicast group are shown.

Click “Refresh” to refresh the contents in the list.

### 15.4.4 Multicast List

Click the **Multicast List Info** option on the top of the page and the **Multicast List Info** page appears.

The screenshot shows the 'Multicast List Info' page. It features a table with columns 'VLAN ID', 'Group', 'Type', and 'Port'. Above the table are navigation controls: 'No.0 Page/Total 0 Page', 'First Prev Next Last', 'Go No. [ ] Page', and 'Search: [ ]'. Below the table is a 'Refresh' button.

Figure 16 Multicast List

On this page the multicat groups, which are existent in the current network and are in the statistics of IGMP snooping, as well as port sets which members in each group belong to are displayed.

Click “Refresh” to refresh the contents in the list.

**Note:**

By default, a multicast list can display up to 15 VLAN items. You can modify the number of multicast items by running `ip http web igmp-groups` after you log on to the device through the Console port or Telnet.

## 15.5 Setting Static ARP

If you click **Layer-2 Config -> Static ARP Config**, the static ARP configuration page appears.

**Basic ARP Config**

## 15.7 LLDP Configuration

### 15.7.1 Configuring the Global Attributes of LLDP

If you click **Layer-2 Config -> LLDP Config -> LLDP Global Config** in the navigation bar, the **Basic Config of LLDP Protocol** page appears, as shown in the following Figure.

**Basic Config of LLDP Protocol**

Protocol State	<input type="text" value="Open the LLDP protocol"/>	
HoldTime Settings	<input type="text" value="120"/>	(0-65535)s
Reinit Settings	<input type="text" value="2"/>	(2-5)s
Setting the packet transmission cycle	<input type="text" value="30"/>	(5-65534)s

**Apply**
**Reset**

**Help**

- ◆ HoldTime: Means the TTL(Time to live) of sending LLDP packets. Its default value is 120s.
- ◆ Reinit: Means the delay of continuously sending LLDP packets. Its default value is 2s.

Figure11 Configuring the Global Attributes of LLDP

You can choose to enable LLDP or disable it. When you choose to disable LLDP, you cannot configure LLDP.

The “HoldTime” parameter means the ttl value of the packet that is transmitted by LLDP. Its default value is 120s.

The “Reinit” parameter means the delay of successive packet transmission of LLDP. Its default value is 2s.

## 15.7.2 LLDP Port Attribute Configuration

If you click **Layer-2 Config -> LLDP Config -> LLDP Interface Config** in the navigation bar, the **LLDP Port Config** page appears.

Port	Receive LLDP Packet	Send LLDP Packet
G0/1	Enable ▾	Enable ▾

Figure 12 Configuring the LLDP port

After the LLDP port is configured, you can enable or disable LLDP on this port.

## 15.8 DDM Configuration

If you click **L2 Config -> DDM Config** in the navigation bar, the **DDM configuration** page appears, as shown in figure 5-21.

Help

#Note: The physical attributes of all the aggregated ports shall be the same, including Speed, Duplex mode and Vlan

If you click **New**, an aggregation group can be created. Up to 32 aggregation groups can be configured through Web and up to 8 physical ports in each group can be aggregated. If you click **Cancel**, you can delete a selected aggregation group; if you click **Modify**, you can modify the member port and the aggregation mode.

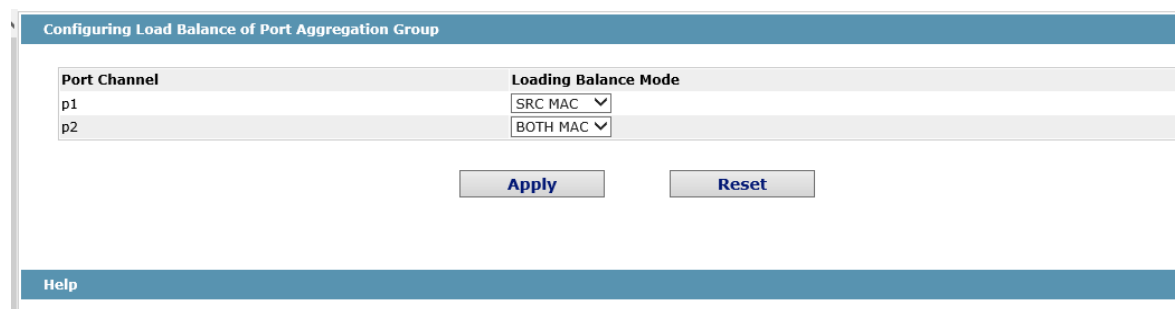

**Help**  
 #Note: Each aggregation port can be configured to have at most 8 physical port.

An aggregation group is selectable when it is created but is not selectable when it is modified. When a member port exists on the aggregation port, you can choose the aggregation mode to be Static, LACP Active or LACP Passive. You can click >> and << to delete and add a member port in the aggregation group.

## 15.9.2 Configuring Load Balance of Port Aggregation Group

Some models support aggregation group based load balance mode configuration and some not but can be configured in the global configuration mode.

The user can adopt varied aggregation modes for different aggregation groups.

## 15.10 EAPS Ring Protection Configuration

### 15.10.1 EAPS Ring List

If you click Layer-2 Config -> Ring Protection ->EAPS Config, the EAPS Ring Config page appears.

Ring ID	Node Type	Ring Description	Control VLAN	Status	Hello	Fail	Preforward	Primary Port/Forwarding/Link Status	Secondary Port/Forwarding/Link Status	Operate
1	Master-node		3	RingFail	1	3	3	None/Blocking/Linkdown	None/Blocking/Linkdown	Edit

In the list shows the currently configured EAPS ring, including the status of the ring, the forwarding status of the port and the status of the link.

Click “New” to create a new EAPS ring.

Click the “Operate” option to configure the “Time” parameter of the ring.

**Note:**

1. The system can support 8 EAPS rings.

2. After a ring is configured, its port, node type and control Vlan cannot be modified. If the port of the ring, the node type or the control Vlan need be adjusted, please delete the ring and then establish a new one.

## 15.10.2 EAPS Ring Configuration

If you click “New” on the EAPS ring list, or “Operate” on the right side of a ring item, the “Configure EAPS” page appears.

**ether-ring**

Ring ID	0		
Node Type	Master Node		
Ring Description	<input type="text"/>		
Control VLAN	<input type="text"/>		
Hello Time	1	(1-10)s	
Fail Time	3	(3-30)s	
Preforward Time	3	(3-30)s	
Primary Port	None		
Secondary Port	None		

**Help**

#Ring Description: You can't input 'Enter'.

**Note:**

If you want to modify a ring, on this page the node type, the control VLAN, the primary port and the secondary port cannot be modified.

In the dropdown box on the right of “Ring ID”, select an ID as a ring ID. The ring IDs of all devices on the same ring must be the same.

The dropdown box on the right of “Node Type” is used to select the type of the node. Please note that only one master node can be configured on a ring.

Enter a value between 1 and 4094 in the text box on the right of “Control VLAN” as the control VLAN ID. When a ring is established, the control VLAN will be automatically established too. Please note that if the designated control VLAN is 1 and the VLAN of the control device is also 1 the control device cannot access the control VLAN. Additionally, please do not enter a control VLAN ID that is same as that of another ring.

In the text boxes of “Primary Port” and “Secondary Port”, select a port as the ring port respectively. If "Node Type" is selected as “Transit-Node”, the two ports will be automatically set to transit ports.

Click “Apply” to finish EAPS ring configuration, click “Reset” to resume the initial values of the configuration, or click “Return” to go back to the EAPS list page.

## 15.11 MEAPS Configuration

### 15.11.1 MEAPS Ring Configuration

If you click Layer-2 Config -> Multiple Ring Protection -> Multiple Ring Protection on the navigation bar, the Multiple Ring Protection Configuration page appears.

**Multiple Ring Protection Configuration**

No.1 Page/Total 1 Page   
 [First](#) [Prev](#) [Next](#) [Last](#)   
 Go No.  Page   
 Search:

Current 1 Item/Total 1 Item

Domain ID	Ring ID	Ring Type	Node Type	Control Vlan	Hello Time	Failed Time	Pre Forward Time	Port	Type	Port	Type	Operate
<input type="checkbox"/>	2	Major Ring	Master Node	4	3	9	9	None	Primary-Port	None	Secondary-Port	<a href="#">Edit</a>

Select All/Select None

The list shows the current configured MEAPS ring, including Domain ID, Ring ID, Ring type, Node type, Control Vlan, Hello Time, Failed Time, Pre Forward Time, primary port and secondary port.

Click New to create a MEAPS ring.

Click Edit on the right and configure the time parameter and the primary and secondary port of the ring.

Note:

1. The system supports 4 MEAPS (0-3).
2. One domain supports 8 rings (0-7).
3. Once one MEAPS is configured, its Domain ID, ring ID, ring type, node type and control Vlan cannot be modified. If adjustment is needed, please delete the Ethernet ring and reset it.

## 15.11.2 MEAPS Ring Configuration

If you click New on the Multiple Ring Protection page or click Edit on the right, the New MEAPS Global Config page appears.

Domain ID\*

Ring ID\*

Ring Type\* Major Ring

Node Type\* Master Node

Control Vlan\*

Hello Time

Failed Time

Pre-Forward Time

Primary-Port None

Secondary-Port None

Apply Reset Go Back

Help

#Your web management may be interrupted as the control VLAN is modified to be the vlan interface that the web browser connects  
#Only the master or transit node can be configured in the major ring  
#The master node, transit node, edge node or assistant node can be configured in the sub ring  
#The master or transit node can be configured in one ring, while the edge node or assistant edge node can be configured in several rings

Note:

In an existed MEAPS ring, its domain ID, ring ID, ring type, node type and control Vlan cannot be modified.

The primary ring can only be configured with the main node and the Transit node.

The secondary ring can be configured with the main node, the transit node, the edge node and the assistant edge node.

The primary node and the transit node can only be existed in one ring. The edge node and the assistant edge node can be existed in multiple rings simultaneously.

On the right drop box of "Primary-Port" and "Secondary-Port", select one port respectively as the ring port or select None

## 15.12 Backup Link Protocol Configuration

### 15.12.1 Backup Link Protocol Global Configuration

If you click Layer-2 Config ->Backup Link Config ->Backup Link Protocol Global Config on the navigation bar, the Backup Link Protocol Global Config page appears.

BackupLink Protocol Global Config				
<a href="#">New</a>				
No.1 Page/Total 1 Page	First Prev Next Last	Go No. <input type="text"/>	Page Search: <input type="text"/>	Current 1 Item/Total 1 Item
Group ID	Preemption Mode	Preemption Delay	Operate	
<input type="checkbox"/> 1	No Preemption		<a href="#">Edit</a>	
<input type="checkbox"/> Select All/Select None				
<a href="#">Delete</a>				

On the page, the current configured backup link groups are shown, including Preemption Mode and Preemption Delay.

Click New to create a new link backup group.

Click Edit on the right to configure Preemption Mode and Preemption Delay.

BackupLink Protocol Global Config	
Group ID	<input type="text"/>
Preemption Mode	No Preemption
Preemption Delay	<input type="text"/>
<a href="#">Apply</a> <a href="#">Reset</a>	

**Note:**

1. The system supports 8 link backup groups.
2. The Preemption mode determines the policy the primary port and the backup port forward packets.

## 15.12.2 Backup Link Protocol Interface Configuration

If you click Layer-2 Config -> Backup Link Protocol Config -> Backup Link Protocol Interface Config on the navigation bar, the Backup Link Protocol Global Config page appears.

BackupLink Protocol Interface Config						
No.1 Page/Total 1 Page	First Prev Next Last	Go No. <input type="text"/>	Page Search: <input type="text"/>	Current 28 Item/Total 28 Item		
Interface Name	Group ID	Interface Attribute	MMU Attribute	Shareload VLAN	Operate	
g0/1					<a href="#">Edit</a>	
g0/2					<a href="#">Edit</a>

<a href="#">Apply</a> <a href="#">Reset</a> <a href="#">Go Back</a>	
Help	
#Share Load VLAN can be Only Configured On The Backup Port	

The backup link group which has configured the primary port cannot take other ports as its primary port. Likewise, the backup link group which has configured the backup port cannot take other ports as its backup port.

## 15.13 DHCP Snooping Configuration

### 15.13.1 DHCP Snooping Global Attribute Configuration

If you click Layer-2 Config -> DHCP Snooping Config -> DHCP Snooping Global Config on the navigation bar, the DHCP Snooping Global Config page appears.

DHCP Snooping Global Config	
DHCP Snooping Global Config	Disable ▾
TFTP Server IP To Save the Port Binding Relationship	<input type="text"/>
TFTP File Name To Save the Port Binding Relationship	ijl ×
Update Interval To Save the Port Binding Relationship	30

Enable global DHCP Snooping protocol, the switch is to monitor all DHCP packets and form the corresponding binding relationship. If the client obtains the address of a switch before the global DHCP Snooping protocol is enabled, the switch cannot add the corresponding binding relationship.

After the switch configuration is rebooted, the previously-configured interface binding will be lost. In this case, there is no binding relationship on this interface. After source IP address monitoring is enabled, the switch rejected forwarding all IP packets. After the TFTP server is configured for interface binding backup, the binding relationship will be backed up to the server through the TFTP protocol. After the switch is restarted, the switch automatically downloads the binding list from the TFTP server, securing the normal running of the network.

When backing up the interface binding relationship, the corresponding file name will be saved on the TFTP server. In this way, different switches can back up their own interface binding relationships to the same TFTP server.

The MAC-to-IP binding relationship on an interface changes dynamically. Hence, you need check whether the binding relationship updates after a certain interval. If the binding relationship updates, it need be backed up again. The default time interval is 30mins.

### 15.13.2 DHCP Snooping VLAN Attribute Configuration

If you click Layer-2 Config -> DHCP Snooping Config -> DHCP Snooping VLAN Config on the navigation bar, the DHCP Snooping VLAN Config page appears.

DHCP Snooping VLAN Config	
Enable DHCP Snooping VLAN	2-3,6
Enable Dynamic ARP Inspection VLAN	3 ×
Enable Verify Source VLAN	<input type="text"/>

If DHCP snooping is enabled in a VLAN, the DHCP packets which are received from all distrusted physical ports in a VLAN will be legally checked. The DHCP response packets which are received from distrusted physical ports in a VLAN will then be dropped, preventing the faked or mis-configured DHCP server from providing address distribution services. For the DHCP request packet from distrusted ports, if the hardware address field in the DHCP request packet does not match the MAC address of this packet,

the DHCP request packet is then thought as a fake packet which is used as the attack packet for DHCP DOS and then the switch will drop it.

When dynamic ARP monitoring is conducted in all physical ports of a VLAN, a received ARP packet will be rejected if the source MAC address and the source IP address of this packet do not match up with the configured MAC-IP binding relationship. The binding relationship on an interface can be dynamically bound by DHCP or configured manually. If no MAC addresses are bound to IP addresses on a physical interface, the switch rejects forwarding all ARP packets.

After source IP address monitoring is enabled in a VLAN, IP packets received from all physical ports in the VLAN will be rejected if their source MAC addresses and source IP addresses do not match up with the configured MAC-to-IP binding relationship. The binding relationship on an interface can be dynamically bound by DHCP or configured manually. If no MAC addresses are bound to IP addresses on a physical interface, the switch rejects forwarding all IP packets received from the physical interface.

### 15.13.3 DHCP Snooping Interface Attribute Configuration

If you click Layer-2 Config -> DHCP Snooping Config -> DHCP Snooping Interface Config on the navigation bar, the DHCP Snooping Interface Config page appears.

Port	DHCP Trust Port	ARP Inspection Trust Port	IP Source Trust Port
g0/1	Distrust	Distrust	Distrust

If an interface is set to be a DHCP-trusting interface, the DHCP packets received from this interface will not be checked.

ARP monitoring is not enabled on those trusted interfaces. The interfaces are distrusted ones by default.

The source address detection function will not be enabled for the IP source address trust interface.

### 15.13.4 DHCP Snooping Manual Binding Configuration

If you click Layer-2 Config -> DHCP Snooping Config -> DHCP Interface Binding List Manual Config on the navigation bar, the DHCP Manual Port List page appears.

**DHCP Manual Binding Port List**

[New](#)

No.1 Page/Total 1 Page    First Prev Next Last Go No.  Page Search:     Current 2 Item/Total 2 Item

	MAC Address	IP Address	Interface Name	VLAN
<input type="checkbox"/>	84:79:73:20:00:00	10.0.0.1	GigaEthernet0/1	2
<input type="checkbox"/>	52:01:22:55:06:66	10.0.0.2	GigaEthernet0/1	3

Select All/Select None [Delete](#)

---

**Help**

#Manual binding list is prior to the dynamic binding list, and the mac address is the only index of the binding item.

If a host does not obtain the address through DHCP, you can add the binding item on an interface of a switch to enable the host to access the network. You can run no ip source binding MAC IP to delete items from the corresponding binding list.

Note that the manually-configured binding items have higher priority than the dynamically-configured binding items. If the manually-configured binding item and the dynamically-configured binding item have the same MAC address, the manually-configured one updates the dynamically-configured one. The interface binding item takes the MAC address as the unique index. The interface binding item

takes the MAC address as the unique index.

Click New to create DHCP Snooping manual Binding Port Item.

MAC Address\*

IP Address\*

Port

VLAN ID\*

**Help**

#MAC: The mac address supports the following formats:XXXXXXXXXX,XXXX.XXXX.XXXX,XX:XX:XX:XX:XX,XX-XX-XX-XX-XX-XX, and X is Hex number

## 15.14 MTU Configuration

If you click Layer-2 Config -> MTU Config on the navigation bar, the MTU Config page appears.

MTU  (1500-9216)

**Help**

#Configure the size of the system mtu, whose default value is 1500

You can set the size of the maximum transmission unit (MTU).

## 15.15 PDP Configuration

### 15.15.1 Configuring the Global Attributes of PDP

If you click Layer-2 Config -> PDP Config in the navigation bar, the Global PDP Config page appears, as shown in figure 4.

Protocol State

HoldTime Settings  (10-255)s

Setting the packet transmission cycle  (5-254)s

Protocol Version

**Help**

#HoldTime: If the other PDP packets are not received, the switch will save the holdtime before clearing the received packets. Its default value is 180s.  
#Cycle of Sending Packets: Its default value is 60s.

You can choose to enable PDP or disable it. When you choose to disable PDP, you cannot configure PDP.

The "HoldTime" parameter means the time to be saved before the router discards the received information if other PDP packets are not received.

### 15.15.2 Configuring the Attributes of the PDP Port

If you click Layer-2 Config -> PDP Config-> PDP port Config in the navigation bar, the Setting the attributes of the PDP port page appears, as shown in figure 5.

Port	Status
g0/1	<input type="text" value="Enable PDP"/>

After the PDP port is configured, you can enable or disable PDP on this port.

## 15.16 STP Configuration

### 15.16.1 STP Status Information

If you click **Layer-2 Config -> STP Config** in the navigation bar, the **STP Config** page appears, as shown in figure 10.

The screenshot shows the STP Configuration page with three main sections:

- Root STP Config:** A table with the following values:
 

Spanning Tree Priority	4096
MAC Address	00E0.0F8E.7025
Hello Time	2
Max Age	20
Forward Delay	15
- Local STP Config:** A form with the following values:
 

Protocol Type	RSTP
Spanning Tree Priority	32768
MAC Address	FCFA.F72E.09A1
Hello Time	2 (1-10)s
Max Age	20 (6-40)s
Forward Delay	15 (4-30)s
BPDU Terminal	Disable
- STP Port's State:** A table with the following data:
 

Interface	Role	State	Cost	Priority.Port ID	Type
G0/1	Root	FWD	20000	128.1	P2p

Figure 10 Configuring the global attributes of STP

The root STP configuration information and the STP port's status are only-read.

On the local STP configuration page, you can modify the running STP mode by clicking the Protocol type dropdown box. The STP modes include STP, RSTP and disabled STP.

The priority and the time need be configured for different modes.

Note:

The change of the STP mode may lead to the interruption of the network.

### 15.16.2 Configuring the Attributes of the STP Port

If you click the "Configure RSTP Port" option, the "Configure RSTP Port" page appears.

Port	Protocol Status	Priority(0~240)	Path-Cost(0~200000000)	Edge Port Property
G0/1	Enable	128	0	Auto
G0/2	Enable	128	0	Auto
G0/3	Enable	128	0	Auto
G0/4	Enable	128	0	Auto
G0/5	Enable	128	0	Auto
G0/6	Enable	128	0	Auto
G0/7	Enable	128	0	Auto
G0/8	Enable	128	0	Auto

Figure 11 Configuring the attributes of RSTP

The configuration of the attributes of the port is irrelative of the global STP mode. For example, if the protocol status is set to “Disable” and the STP mode is also changed, the port will not run the protocol in the new mode. The default value of the path cost of the port is 0, meaning the path cost is automatically calculated according to the speed of the port. If you want to change the path cost, please enter another value.

## 15.17 IGMP-Snooping Configuration

### 15.17.1 IGMP-Snooping Configuration

If you click **Layer-2 Config -> IGMP snooping**, the IGMP-Snooping configuration page appears.

IGMP Snooping Config	
Multicast Filtration Mode	Transfer Unknown
IGMP Snooping	Enable
Enable Auto Query	Enable

[Apply](#)

Figure 12 IGMP-snooping configuration

On this page you can set whether to make a switch to forward unknown multicasts, whether to enable IGMP snooping, and whether to configure the switch as the querier of IGMP.

### 15.17.2 IGMP-Snooping VLAN List

If you click **Layer-2 Config -> IGMP snooping vlan list**, the **IGMP-Snooping VLAN list** page appears.

	VLAN ID	Status of the IGMP Snooping Vlan	Immediate-leave	Multicast Router's Port	Operate
<input type="checkbox"/>	1	Running	Disable	SWITCH(querier);	<a href="#">Edit</a>

Figure 13: IGMP-snooping VLAN list

If you click **New**, IGMP-snooping VLAN configuration can be done. Through Web up to 8 physical ports can be set on each IGMP snooping VLAN. If you click **Cancel**, a selected IGMP-Snooping VLAN can be deleted; if you click **Edit**, you can modify the member port, running status and immediate-leave of IGMP-Snooping VLAN.

<b>VLAN ID</b>	<input type="text" value="2"/>

## 15.19 Ring Protection Configuration

### 15.19.1 EAPS Ring List

If you click **Layer-2 Config -> Ring protection Config**, the **EAPS ring list** page appears.

Ring ID	Node Type	Ring Description	Control VLAN	Status	Hello	Fail	Preforward	Primary Port/Forwarding/Link Status	Secondary Port/Forwarding/Link Status
<input type="checkbox"/> Select All/Select None									
								<a href="#">Delete</a>	<a href="#">Refresh</a>

Figure 19 EAPS Ring List

In the list shows the currently configured EAPS ring, including the status of the ring, the forwarding status of the port and the status of the link.

Click “New” to create a new EAPS ring.

Click the “Operate” option to configure the “Time” parameter of the ring.

Note:

1. The system can support 8 EAPS rings.
2. After a ring is configured, its port, node type and control Vlan cannot be modified. If the port of the ring, the node type or the control Vlan need be adjusted, please delete the ring and then establish a new one.

### 15.19.2 EAPS Ring Configuration

If you click “New” on the EAPS ring list, or “Operate” on the right side of a ring item, the “Configure EAPS” page appears.

**ether-ring**

Ring ID	<input type="text" value="0"/>
Node Type	<input type="text" value="Master Node"/>
Ring Description	<input type="text"/>
Control VLAN	<input type="text"/>
Hello Time	<input type="text" value="1"/> (1-10)s
Fail Time	<input type="text" value="3"/> (3-30)s
Preforward Time	<input type="text" value="3"/> (3-30)s
Primary Port	<input type="text" value="None"/>
Secondary Port	<input type="text" value="None"/>

[Apply](#) [Reset](#) [Go Back](#)

Figure 20 EAPS ring configuration

Note:

If you want to modify a ring, on this page the node type, the control VLAN, the primary port and the secondary port cannot be modified.

In the dropdown box on the right of “Ring ID”, select an ID as a ring ID. The ring IDs of all devices on the same ring must be the same.

The dropdown box on the right of “Node Type” is used to select the type of the node. Please note that only one master node can be configured on a ring.

Enter a value between 1 and 4094 in the text box on the right of “Control VLAN” as the control VLAN ID. When a ring is established, the control VLAN will be automatically established too. Please note that if the designated control VLAN is 1 and the VLAN of the control device is also 1 the control device cannot access the control VLAN. Additionally, please do not enter a control VLAN ID that is same as that of another ring.

In the text boxes of “Primary Port” and “Secondary Port”, select a port as the ring port respectively. If "Node Type" is selected as “Transit-Node”, the two ports will be automatically set to transit ports.

Click “Apply” to finish EAPS ring configuration, click “Reset” to resume the initial values of the configuration, or click “Return” to go back to the EAPS list page.

## 15.20 EVC Configuration

### 15.20.1 Global QinQ Configuration

If you click **Layer 2 Config -> EVC Config**, the **Global QinQ configuration** page appears.

Figure 21: Global EVC configuration

In global EVC configuration mode, you can enable or disable the global dot1q.

### 15.20.2 Configuring the QinQ Port

If you click **Layer 2 Config -> EVC Config -> QinQ port Config**, the **Configuring the QinQ port** page appears.

QinQ基本配置						
第1页/共1页		第一页	上一页	下一页	最后一页	前往 第 <input type="text"/> 页 搜索: <input type="text"/>

**Help**

The primary IP must be configured for the VLAN interface before the secondary IP is configured

Figure 3: VLAN interface configuration

**Note:**

Before the accessory IP of a VLAN interface is set, you have to set the main IP.

## 16.2 Setting the Static Route

If you click **Layer-3 Config -> Static route Config**, the **Static route configuration** page appears.

**Static Routing Protocol Config**

No.0 Page/Total 0 Page First Prev Next Last Go No.  Page Search:  Current 0 Item/Total 0 Item

Default Route	Dest IP Segment	Dest IP Mask	Interface Type	VLAN Interface	Gateway's IP Address	Forwarding Address	Routing Address	Distance metric	Routing Tag	Global	Specify the route description	Operate
<input type="checkbox"/> Select All/Select None												
<input type="button" value="Delete"/>												

**Help**

◆Global:The next-hop address is in the global routing table.

Figure 4 Displaying the static route

Click **Create** to add a static route.

If you click **Edit**, you can modify the current static route.

If you click **Cancel**, you can cancel the chosen static route.

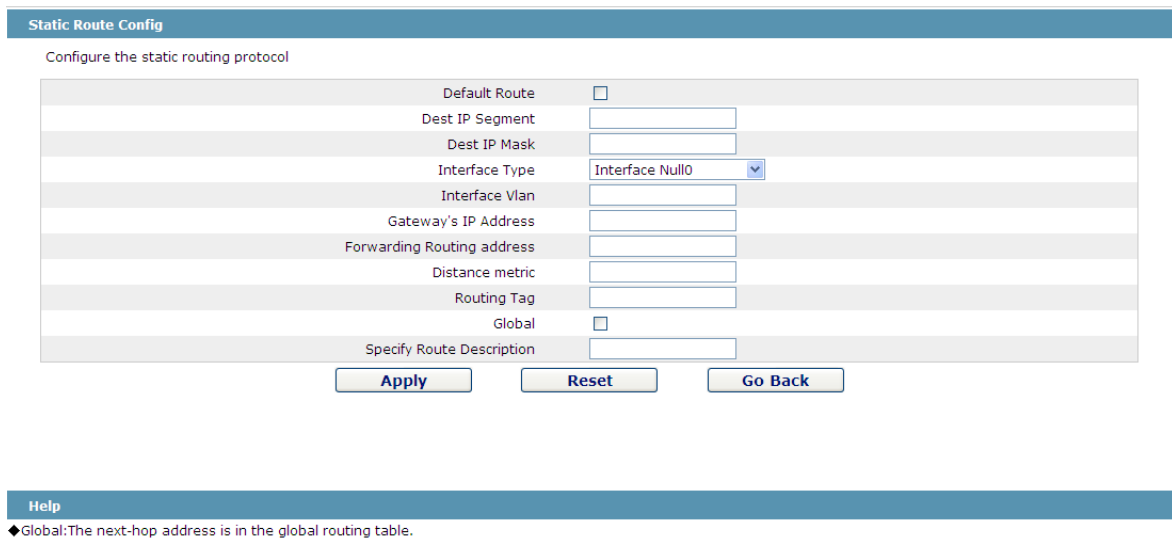

Figure 5: Setting the static route

## 16.3 IGMP Agent

### 16.3.1 Enabling the IGMP Agent

If you click **Layer-3 Config -> IGMP agent**, the **IGMP agent** page appears.

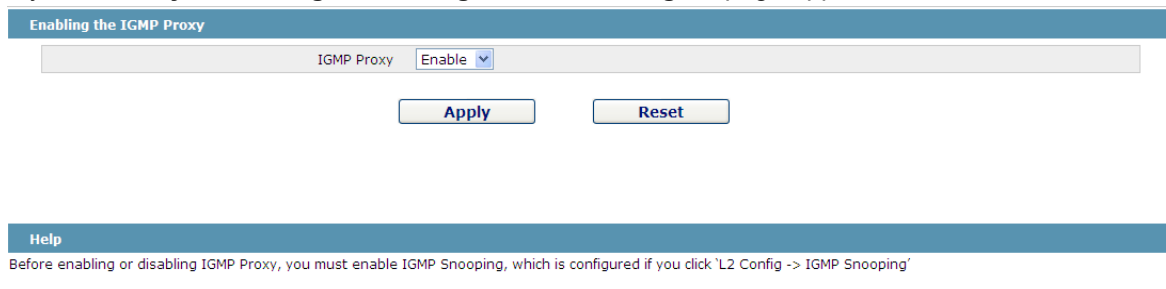

Figure 6: Enabling the IGMP agent

On this page you can enable or disable the IGMP agent. It is noted that the IGMP agent can be enabled or disabled on a switch only after the IP IGMP-snooping function is enabled on the switch.

### 16.3.2 Setting the IGMP Agent

If you click **Layer-3 Config -> IGMP agent -> IGMP agent Config**, the **IGMP agent configuration** page appears. Click **New** to create a new IGMP agent.

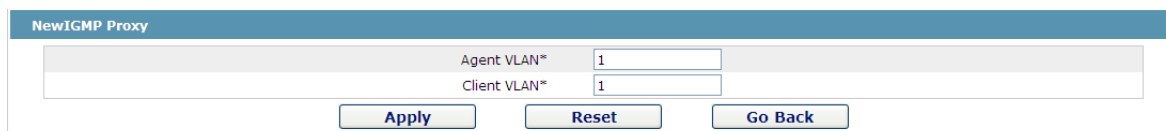

Figure 7: Setting the IGMP agent

# Chapter 17 Advanced Configuration

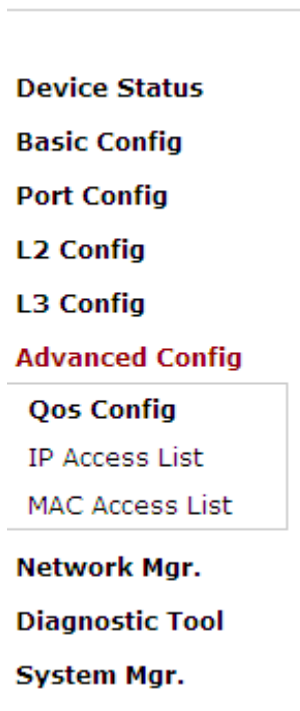

Figure 1 A list of advanced configuration

## 17.1 QoS Configuration

### 17.1.1 Configuring QoS Port

If you click **Advanced Config -> QoS -> Configure QoS Port**, the **Port Priority Config** page appears.

Port	COS value
G0/1	0
G0/2	0
G0/3	0
G0/4	0
G0/5	
G0/6	
G0/7	
G0/8	
G0/9	
G0/10	
G0/11	

Figure 2 Configuring the QoS Port

You can set the CoS value by clicking the dropdown box on the right of each port and selecting a value. The default CoS value of a port is 0, meaning the lowest priority. If the CoS value is 7, it means that the priority is

the highest.

## 17.1.2 Global QoS Configuration

If you click **Advanced Config** -> **QoS Config** -> **Global QoS Config**, the **Port's QoS parameter configuration** page appears.

The screenshot shows the 'QoS Config' interface. At the top, there's a 'Schedule Policy' dropdown set to 'sp'. Below this, there are eight queue configuration rows. Each row has a 'Queue' label (Queue 1 to Queue 8), a numerical value in a text box, and a range in parentheses. For example, Queue 1 has '1' and '(1-15)'. Below the queue settings is a 'COS-to-queue map' table with 'COS value' (0-7) in the first column and 'Queue' (Queue 1-8) in the second column, each with a dropdown arrow. At the bottom of the form are 'Apply' and 'Reset' buttons. A 'Help' section at the very bottom contains two diamond-shaped icons and text: '◆ If you want to configure the cos value of the interface, please goto QoS Interface Configuration.' and '◆ If the bandwidth of queue has been set to 0, the queue after this also must be set to 0'.

Figure 3 Configuring Global QoS Attributes

In WRR schedule mode, you can set the weights of the QoS queues. There are 4 queues, among which queue 1 has the lowest priority and queue 4 has the highest priority.

## 17.2 MAC Access Control List

### 17.2.1 Setting the Name of the MAC Access Control List

If you click **Advanced Config** -> **MAC access control list** -> **MAC access control list Config**, the MAC ACL configuration page appears.

The screenshot shows the 'MAC ACL Config' page. It has a 'New' button at the top left. Below it is a navigation bar with 'No.0 Page/Total 0 Page', 'First Prev Next Last', 'Go No. [ ] Page', and 'Search: [ ]'. On the right, it says 'Current 0 Item/Total 0 Item'. The main area contains a table with two columns: 'Name of the MAC Access Control List' and 'Operate'. Below the table is a checkbox labeled 'Select All/Select None' and a 'Delete' button.

Figure 4: MAC access control list configuration

Click **New** to add a name of the MAC access control list. Click **Cancel** to delete a MAC access control list.

Creating MAC ACL

Name of the MAC ACL\*

Figure 5: Setting the Name of MAC Access Control list

## 17.2.2 Setting the Rules of the MAC Access Control List

If you click **Modify**, the corresponding MAC access control list appears and you can set the corresponding rules for the MAC access control list.

Figure 15: Applying the IP access control list

# Chapter 18 Network Management Configuration

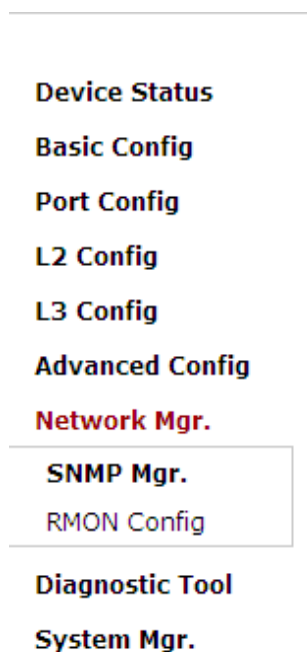

Figure 1: Network management configuration list

## 18.1 SNMP Configuration

If you click **Network management Config -> SNMP management** in the navigation bar, the **SNMP management** page appears, as shown in figure 2.

### 18.1.1 SNMP Community Management

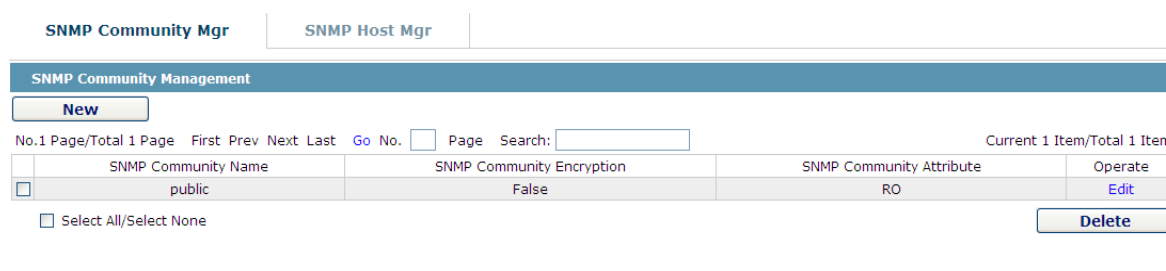

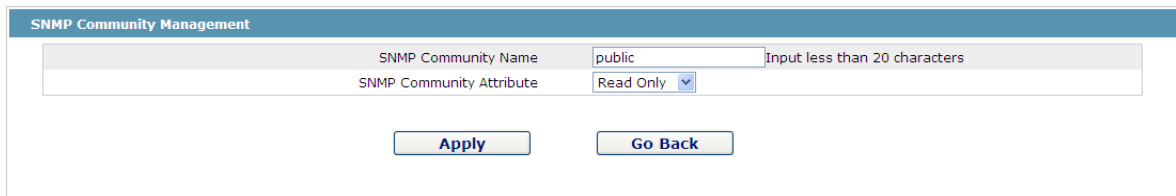

Figure 2 SNMP community management

On the SNMP community management page, you can know the related configuration information about SNMP community.

You can create, modify or cancel the SNMP community information, and if you click **New** or **Edit**, you can switch to the configuration page of SNMP community.

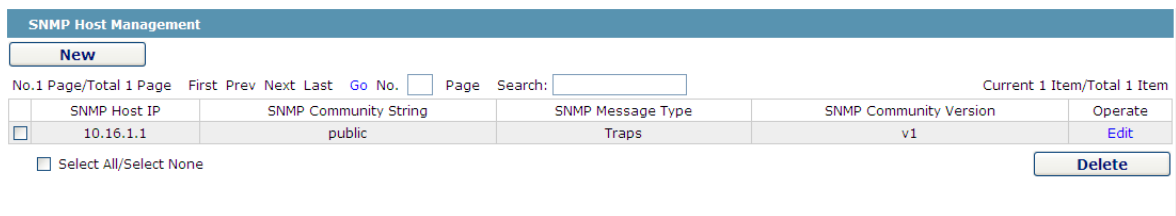

The screenshot shows the 'SNMP Community Management' interface. It features a header bar with the title 'SNMP Community Management'. Below the header, there are two input fields: 'SNMP Community Name' with the value 'public' and a note 'Input less than 20 characters', and 'SNMP Community Attribute' with a dropdown menu set to 'Read Only'. At the bottom of the form, there are two buttons: 'Apply' and 'Go Back'.

Figure 4.2 SNMP community management settings

On the SNMP community management page you can enter the SNMP community name, select the attributes of SNMP community, which include Read only and Read-Write.

## 18.1.2 SNMP Host Management

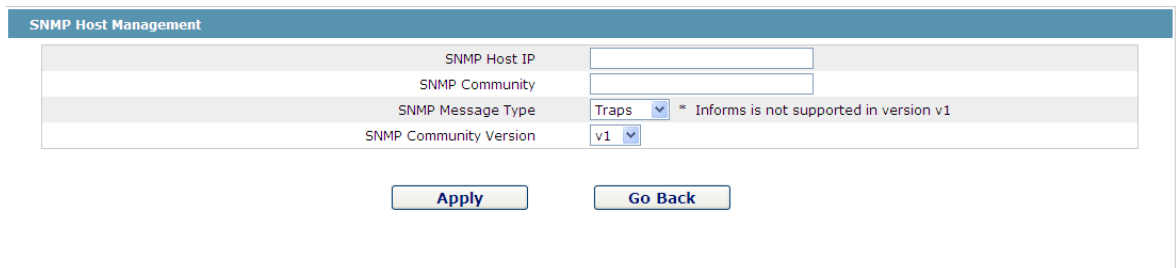

The screenshot shows the 'SNMP Host Management' interface. It has a header bar with the title 'SNMP Host Management' and a 'New' button. Below the header, there is a navigation bar with 'No.1 Page/Total 1 Page', 'First', 'Prev', 'Next', 'Last', 'Go No.', a search box, and 'Page'. On the right, it says 'Current 1 Item/Total 1 Item'. Below this is a table with the following columns: 'SNMP Host IP', 'SNMP Community String', 'SNMP Message Type', 'SNMP Community Version', and 'Operate'. The table contains one row with the following data: '10.16.1.1', 'public', 'Traps', 'v1', and 'Edit'. Below the table, there is a checkbox labeled 'Select All/Select None' and a 'Delete' button.

Figure 4 SNMP host management

On the SNMP community host page, you can know the related configuration information about SNMP host.

You can create, modify or cancel the SNMP host information, and if you click **New** or **Edit**, you can switch to the configuration page of SNMP host.

The screenshot shows the 'SNMP Host Management' configuration form. It has a header bar with the title 'SNMP Host Management'. Below the header, there are four input fields: 'SNMP Host IP', 'SNMP Community', 'SNMP Message Type' (with a dropdown menu set to 'Traps' and a note '\* Informs is not supported in version v1'), and 'SNMP Community Version' (with a dropdown menu set to 'v1'). At the bottom of the form, there are two buttons: 'Apply' and 'Go Back'.

Figure 5 SNMP host management settings

On the SNMP host configuration page, you can enter **SNMP Host IP**, **SNMP Community**, **SNMP Message Type** and **SNMP Community Version**. **SNMP Message Type** includes **Traps** and **Informs**, and as to version 1, **SNMP Message Type** does not support **Informs**.

## 18.2 RMON

### 18.2.1 RMON Statistic Information Configuration

If you click **Network Management Config -> RMON -> RMON Statistics -> New**, the **RMON Statistics** page appears.

Interface Statistics Config		
Interface	G0/1	
Index	1	(1-65535)
Owner	demon	

---

**Help**

- ◆ It must be configured in interface mode, which is used to enable the interface statistics
- \*◆ The string you totally entered is less than or equal to 255 characters

Figure 6 Configuring the RMON statistic information

You need to set a physical port to be the reception terminal of the monitor data.

The index is used to identify a specific interface; if the index is same to that of the previous application interface, it will replace that of the previous application interface.

At present, the monitor statistic information can be obtained through the command line “show rmon statistics”, but the Web does not support this function.

## 18.2.2 RMON History Information Configuration

If you click **Network Management Config -> RMON -> RMON history -> New**, the **RMON history** page appears.

Interface History config		
Interface	G0/1	
Index		(1-65535)
Sampling Number	50	(1-65535)
Sampling Interval	1800	(1-3600)
Owner	config	Enter less than 31 characters*

---

**Help**

- ◆ Sampling Number means how many history items must be saved recently

Figure 7 Configuring the RMON history information

You need to set a physical port to be the reception terminal of the monitor data.

The index is used to identify a specific interface; if the index is same to that of the previous application interface, it will replace that of the previous application interface.

The sampling number means the items that need be reserved, whose default value is 50.

The sampling interval means the time between two data collection, whose default value is 1800s.

At present, the monitor statistic information can be obtained through the command line “show rmon history”, but the Web does not support this function.

## 18.2.3 RMON Alarm Information Configuration

If you click **Network Management Config -> RMON -> RMON Alarm -> New**, the **RMON Alarm** page appears.

RMON Alarm config		
Index	1	(1-65535)
MIB Node	IfInOctets	
OID	1.3.6.1.2.1.2.2.1.10	
Interface	G0/1	
Alarm type	absolute	
Sampling Interval	5	(1-2147483647)
Rising Threshold	5	(-2147483648 - 2147483647)
Rising Event Index	2	(1-65535)
Falling Threshold	6	(-2147483648 - 2147483647)
Falling Event Index	3	(1-65535)
Owner	default	Enter less than 31 characters*

---

**Help**

- ◆ The owner can be empty
- ◆ The string you totally entered is limited in 255 characters

Figure 8 Configuring the RMON alarm information

The index is used to identify a specific alarm information; if the index is same to the previously applied index, it will replace the previous one.

The MIB node corresponds to OID.

If the alarm type is **absolute**, the value of the MIB object will be directly monitored; if the alarm type is **delta**, the change of the value of the MIB object in two sampling will be monitored.

When the monitored MIB object reaches or exceeds the rising threshold, the event corresponding to the index of the rising event will be triggered.

When the monitored MIB object reaches or exceeds the falling threshold, the event corresponding to the index of the falling event will be triggered.

## 18.2.4 RMON Event Configuration

If you click **Network Management Config -> RMON -> RMON Event -> New**, the **RMON event** page appears.

RMON Event Config		
Index		(1-65535)
Owner		
Description		
Enable log	<input type="checkbox"/>	
Enable trap	<input type="checkbox"/>	
Community		

---

**Help**

- ◆ If the log is enabled, the items will be added to the log table at the trigger of the event.
- ◆ If the trap is enabled, the trap will be generated with the event community name.
- \*◆ The string you totally entered is less than 255 characters

Figure 9 RMON event configuration

The index corresponds to the rising event index and the falling event index that have already been configured on the **RMON alarm config** page.

The owner is used to describe the descriptive information of an event.

"Enable log" means to add an item of information in the log table when the event is triggered.

"Enable trap" means a trap will be generated if the event is triggered.

# Chapter 19 Diagnosis Tools

Figure 1: Diagnosis tool list

## 19.1 Ping

### 19.1.1 Ping

If you click **Diagnosis Tools -> Ping**, the **Ping** page appears.

**Ping**

Ping is a typical network tool, which is used to identify the states of some network functions. The states of network functions are the basis of regular network diagnosis. Ping is used to check whether the peer is reachable. If Ping transmits a packet to the host and receives a response from the peer, the peer is reachable.

PING test-->

Destination address*	<input type="text"/>
Source IP address	<input type="text"/> (An option which can be null)
Size of the PING packet	<input type="text"/> (36-20000) (An option which can be null)

**PING**

**Help**

- ◆The ping program can test whether a destination can be reached, or it can test the packet loss to reach a destination.
- ◆Destination address: Enter the to-be-tested destination address.
- ◆Source IP: Source IP.
- ◆Packet's size: Designate the size of a packet when the packet is used to ping a destination. It is optional and cannot be configured.

Figure 2 Ping

Ping is used to test whether the switch connects other devices.

If a Ping test need be conducted, please enter an IP address in the “Destination address” textbox, such as the IP address of your PC, and then click the “PING” button. If the switch connects your entered address, the device can promptly return a test result to you; if not, the device will take a little more time to return the test

result.

“Source IP address” is used to set the source IP address which is carried in the Ping packet.

“Size of the PING packet” is used to set the length of the Ping packet which is transmitted by the device.

# Chapter 20 System Management

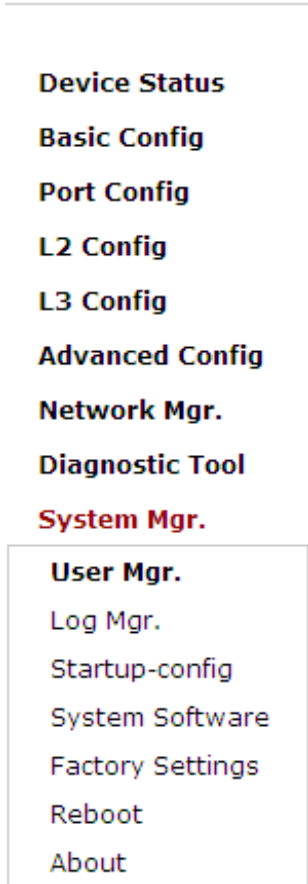

Figure 1 Navigation list of system management

## 20.1 User Management

### 20.1.1 User List

If you click **System Manage -> User Manage**, the **User Management** page appears.

The screenshot shows the 'User Management' page. At the top, there is a 'New' button. Below it, there is a table with columns: User name, User permission, Pass-Group, Authen-Group, Author-Group, User Status, and Operate. The table contains one row for the user 'admin' with permission 'System administrator' and status 'Normal'. There is an 'Edit' link in the Operate column. Below the table, there is a 'Select All/Select None' checkbox and a 'Delete' button. At the bottom, there is a 'Help' section with three notes.

No.1	User name	User permission	Pass-Group	Authen-Group	Author-Group	User Status	Operate
1	admin	System administrator				Normal	<a href="#">Edit</a>

Select All/Select None

**Help**

- ◆Note: When only one Admin user exists, You cannot delete the current administrator user. Otherwise, you cannot log on to the switch and configure it.
- ◆Users can be divided into the Admin user and the limited user according to the permission. The Admin user can use all functions of the switch, including browsing, configuring and remote login, while the limited user only has the permission to browse the switch's running state through the WEB page.
- ◆Click the 'New' button to create a new user.

Figure 2 User list

You can click "New" to create a new user.

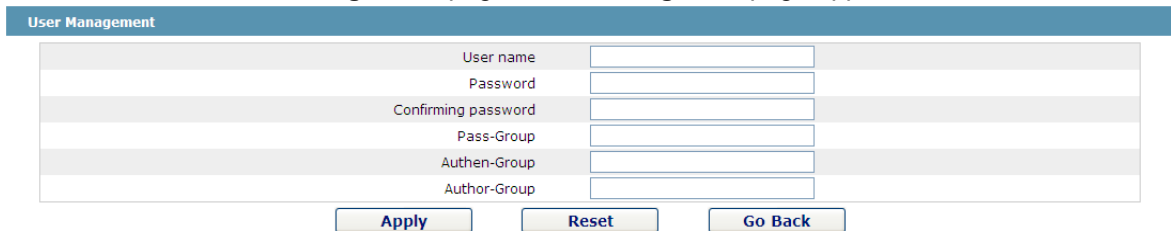

To modify the permission or the login password, click “Edit” on the right of the user list.

Note:

1. Please make sure that at least one system administrator exists in the system, so that you can manage the devices through Web.
2. The limited user can only browse the status of the device.

## 20.1.2 Establishing a New User

If you click “New” on the **User Management** page, the **Creating User** page appears.

User name	<input type="text"/>
Password	<input type="password"/>
Confirming password	<input type="password"/>
Pass-Group	<input type="text"/>
Authen-Group	<input type="text"/>
Author-Group	<input type="text"/>

Figure 3 Creating new users

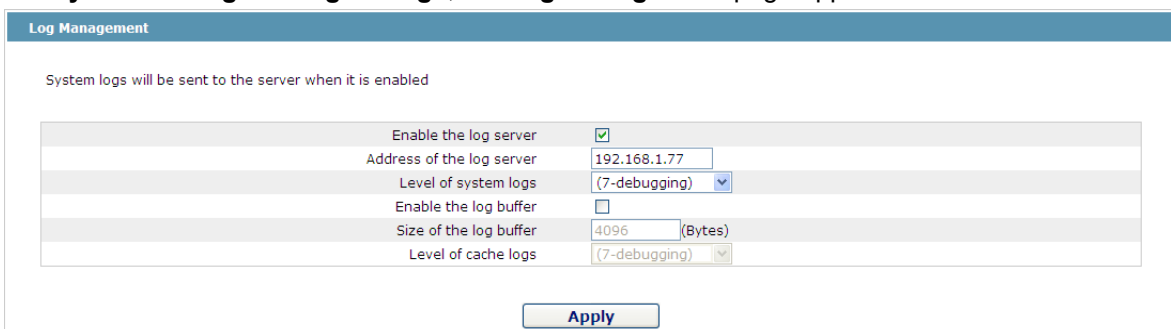

In the “User name” text box, enter a name, which contains letters, numbers and symbols except “?”, “\”, “&”, “#” and the "Space" symbol. \ " & #和空格以外的字符。

In the “Password” textbox enter a login password, and in the “Confirming password” textbox enter this login password again.

In the “User permission” dropdown box set the user's permission. The “System administrator” user can browse the status of the device and conduct relevant settings, while the limited user can only browse the status of the device.

## 20.2 Log Management

If you click **System Manage -> Log Manage**, the **Log Management** page appears.

System logs will be sent to the server when it is enabled

Enable the log server	<input checked="" type="checkbox"/>
Address of the log server	<input type="text" value="192.168.1.77"/>
Level of system logs	<input type="text" value="(7-debugging)"/>
Enable the log buffer	<input type="checkbox"/>
Size of the log buffer	<input type="text" value="4096"/> (Bytes)
Level of cache logs	<input type="text" value="(7-debugging)"/>

Figure 4 Log management

If “Enabling the log server” is selected, the device will transmit the log information to the designated server. In this case, you need enter the address of the server in the “Address of the system log server” textbox and select the log's grade in the “Grade of the system log information” dropdown box.

If “Enabling the log buffer” is selected, the device will record the log information to the memory. By logging on to the device through the Console port or Telnet, you can run the command “show log” to browse the logs

which are saved on the device. The log information which is saved in the memory will be lost after rebooting. Please enter the size of the buffer area in the “Size of the system log buffer” textbox and select the grade of the cached log in the “Grade of the cache log information” dropdown box.

## 20.2.1 Managing the Configuration Files

If you click **System Manage -> Configuration file**, the **Configuration file** page appears.

## 20.2.2 Exporting the Configuration Information

Figure 5 Exporting the configuration file

The current configuration file can be exported, saved in the disk of PC or in the mobile storage device as the backup file.

To export the configuration file, please click the “Export” button and then select the “Save” option in the pop-up download dialog box.

The default name of the configuration file is “startup-config”, but you are suggested to set it to an easily memorable name.

## 20.2.3 Importing the Configuration Information

Figure 6 Importing the configuration files

You can import the configuration files from PC to the device and replace the configuration file that is currently being used. For example, by importing the backup configuration files, you can resume the device to its configuration of a previous moment.

---

### Note:

1. Please make sure that the imported configuration file has the legal format for the configuration file with illegal format cannot lead to the normal startup of the device.
  2. If error occurs during the process of importation, please try it later again, or click the “Save All” button to make the device re-establish the configuration file with the current configuration, avoiding the incomplete file and the abnormality of the device.
  3. After the configuration file is imported, if you want to use the imported configuration file immediately, do not click “Save All”, but reboot the device directly.
-

## 20.3 Software Management

If you click **System Manage -> Software Upgrade**, the software management page appears.

### 20.3.1 Backing up the IOS Software

Figure 7 Backing up IOS

On this page the currently running software version is displayed. If you want to backup IOS, please click “Backuping IOS”; then on the browser the file download dialog box appears; click “Save” to store the IOS file to the disk of the PC, mobile storage device or other network location.

Note:

IOS 文件的缺省名称为“Switch.bin”，建议在备份时将其修改为易于识别和查找的名称。

### 20.3.2 Upgrading the IOS Software

Note:

1. Please make sure that your upgraded IOS matches the device type, because the matchable IOS will not lead to the normal startup of the device.
2. The upgrade of IOS probably takes one to two minutes; when the “updating” button is clicked, the IOS files will be uploaded to the device.
3. If errors occur during upgrade, please do not restart the device or cut off the power of the device, or the device cannot be started. Please try the upgrade again.
4. After the upgrade please save the configuration and then restart the device to run the new IOS.

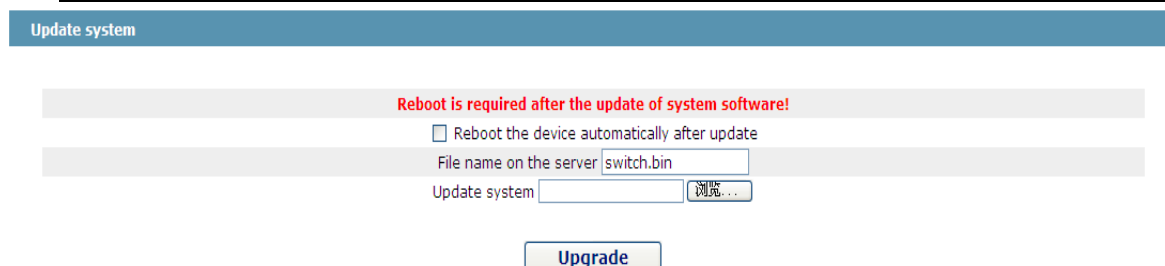

Figure 8 Upgrading the IOS software

The upgraded IOS is always used to solve the already known problems or to perfect a specific function. If you device run normally, do not upgrade your IOS software frequently.

If IOS need be upgraded, please first enter the complete path of the new IOS files in the textbox on the right of “Upgrading IOS”, or click the “Browsing” button and select the new IOS files on your computer, and then click “Updating”.

## 20.4 Resuming Initial Configuration

If you click **System Manage -> Resume Config**, the **Resuming the original configuration** page appears.

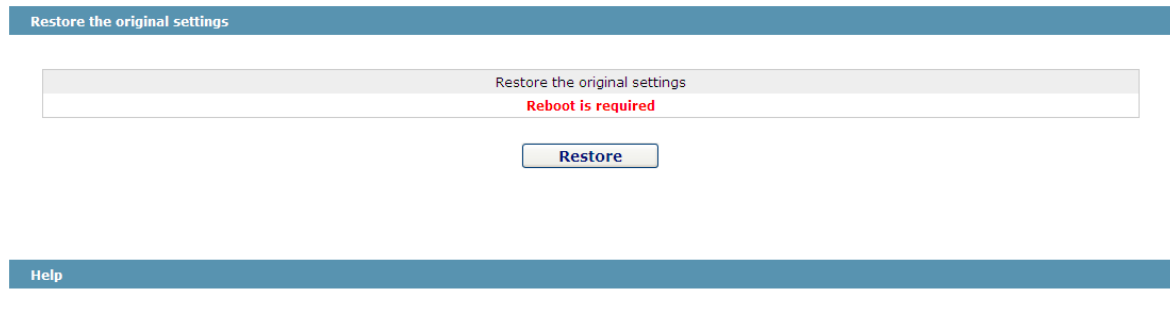

Figure 9 Resuming the original configuration

---

### Note:

1. If you click the “Resume” button, the current configuration will be replaced by the original configuration, which will take effect after rebooting.
  2. Before rebooting the device still works under the current configuration, and if you click “Save All” at the moment, the current configuration will replace the original configuration. The original configuration, therefore, cannot take effect after rebooting.
  3. After the rebooting is done and the original configuration takes effect, the Web access of the device will be automatically started. The address of Vlan 1 is 192.168.0.1/255.255.255.0, and the username and password are both “admin”.
- 

To resume the original configuration, click “Resume” and then reboot the device.

## 20.5 Rebooting the Device

If you click **System Manage -> Reboot Device**, the **Rebooting** page appears.

Figure 10 Rebooting the device

If the device need be rebooted, please first make sure that the modified configuration of the device has already been saved, and then click the “Reboot” button.

# Chapter 21 Interface Configuration Overview

This section helps user to learn various kinds of interface that our switch supports and consult configuration information about different interface types.

For detailed description of all interface commands used in this section, refer to Interface configuration command. For files of other commands appeared in this section, refer to other parts of the manual.

The introduction includes communication information that can be applied to all interface types.

## 21.1 Supported Interface Types

For information about interface types, please refer to the following table.

Interface type	Task	Reference
Ethernet interface	Configures fast Ethernet interface. Configures gigabit Ethernet interface. Configures 10GE Ethernet interface.	Setting the Ethernet Interface
Logical interface	Loopback interface Null interface Aggregation interface VLANinterface SuperVlan interface	Conifugring Logical Interface

The two supported kinds of interface: Ethernet interface and logical interface. The Ethernet interface type depends on one device depends on the standard communication interface and the interface card or interfaced module installed on the switch. The logical interface is the interface without the corresponding physical device, which is established by user manually.

The supported Ethernet interfaces of our switch include:

- Fast Ethernet
- Gigabit Ethernet interface
- 10GE Ethernet interface

The supported logical interface of our switch include:

- Loopback interface
- Null interface
- Aggregation interface
- VLANinterface
- SuperVlan interface

## 21.2 Interface Configuration Introduction

The following description applies to the configuration process of all interfaces. Take the following steps to perform interface configuration in global configuration mode.

- (1) At this time, the switch prompt becomes 'config\_' plus the shortened form of the interface to be configured. Use these interfaces in terms of their numbers. Numbers are assigned during installation(exworks) or when an interface card are added to the system. Run the show

interface command to display these interfaces. Each interface that the device supports provides its own state as follows:

```
Switch_config#show interface g0/2
GigaEthernet0/2 is administratively down, line protocol is down
  Hardware is Giga-Combo-FX, address is 00e0.0f8d.e0e1 (bia 00e0.0f8d.e0e1)
  MTU 1500 bytes, BW 10000 kbit, DLY 10 usec
  Encapsulation ARPA
  port info 1 0 2 1
  Auto-duplex,   Auto-speed
  flow-control off
    Received 0 packets, 0 bytes
    0 broadcasts, 0 multicasts
    0 discard, 0 error, 0 PAUSE
    0 align, 0 FCS, 0 symbol
    0 jabber, 0 oversize, 0 undersize
    0 carriersense, 0 collision, 0 fragment
    0 L3 packets, 0 discards, 0 Header errors
  Transmitted 0 packets, 0 bytes
    0 broadcasts, 0 multicasts
    0 discard, 0 error, 0 PAUSE
    0 sqettest, 0 deferred
    0 single, 0 multiple, 0 excessive, 0 late
    0 L3 forwards
```

**Note:**

There is no need to add blank between interface type and interface number. For example, in the above line, g 0/2 or g 0/2 is both available.

- (2) You can configure the interface configuration commands in interface configuration mode. Various commands define protocols and application programs to be executed on the interface. These commands will stay until user exits the interface configuration mode or switches to another interface.
- (3) Once the interface configuration has been completed, use the show command in the following chapter 'Monitoring and Maintaining Interface' to test the interface state.

# Chapter 22 Interface Configuration

## 22.1 Configuring Interface Common Attribute

The following content describes the command that can be executed on an interface of any type and configures common attributes of interface. The common attributes of interface that can be configured include: interface description, bandwidth and delay and so on.

## 22.2 Adding Description

Adding description about the related interface helps to memorize content attached to the interface. This description only serves as the interface note to help identify uses of the interface and has no effect on any feature of the interface. This description will appear in the output of the following commands: show running-config and show interface. Use the following command in interface configuration mode if user wants to add a description to any interface.

Command	Purpose
<b>description</b> <i>string</i>	Adds description to the currently-configured interface.

For examples relevant to adding interface description, please refer to the following section 'Interface Description Example'.

### 22.2.1 Configuring Bandwidth

The upper protocol uses bandwidth information to perform operation decision. Use the following command to configure bandwidth for the interface:

Command	Purpose
<b>bandwidth</b> <i>kilobps</i>	Configures bandwidth for the currently configured interface.

The bandwidth is just a routing parameter, which doesn't influence the communication rate of the actual physical interface.

### 22.2.2 Configuring Time Delay

The upper protocol uses time delay information to perform operation decision. Use the following command to configure time delay for the interface in the interface configuration mode.

Command	Purpose
<b>delay</b> <i>tensofmicroseconds</i>	Configures time delay for the currently configured interface.

The configuration of time delay is just an information parameter. Use this command cannot adjust the actual time delay of an interface.

## 22.3 Monitoring and Maintaining the Port

To maintain and monitor the interface, perform the following tasks:

- To browse the state of an interface, run the above-mentioned command.
- Initializing and deleting the port
- Closing and restarting the port

### 22.3.1 Browsing the State of an Interface

Our switches support those commands to display interface information, including the version ID of hardware and software, and the interface state. The following table presents you some port monitor commands: For more details, please refer to the "Interface Configuration Command".

Run the following commands:

Command	Purpose
<b>show interface</b> [type [slot port]]	Displays the state of a port.
<b>show running-config</b>	Displays the current settings.
<b>show version</b>	Displays the memory configuration, the software version and the startup mirror.

### 22.3.2 Initializing and Deleting the Port

The logic interface can be dynamically created and deleted. So it is with the sub-interface and the channelized interface. The physical interface which cannot be deleted dynamically can return to the default setting of the interface. In global configuration mode, run the following command to initialize and delete an interface:

Command	Purpose
<b>no interface</b> [type [slot port]]	Initializes a physical interface or deletes a virtual interface.

### 22.3.3 Closing and Restarting the Port

You can disable the interface, so that all functions on this interface can be disabled, and then all monitor commands will label this interface as unavailable. This information can be transmitted to other devices through the dynamic routing protocol. The modification on any route will not affect this port.

Run the following commands in interface configuration mode to shut down an interface and then restart it.

Command	Purpose
<b>shutdown</b>	Disable the interface.
<b>no shutdown</b>	Restarting the interface

To check whether an interface is shut down, you can run show interface and show running-config. After the show interface command is run, a disabled interface will be presented as "administratively down". For more examples, please refer to "Interface Shutdown Example".

## 22.4 Setting the Ethernet Interface

In this section the procedure of setting the Ethernet interface will be described. The detailed configuration includes the following steps, among which step 1 is obligatory while other steps are optional.

## 22.4.1 Choosing an Ethernet Interface

Run the following command in global configuration mode to enter the Ethernet interface configuration mode:

Command	Function
<b>interface fastethernet</b> [slot port]	Enters the fast-Ethernet interface configuration mode.
<b>interface gigaethernet</b> [slot port]	Enters the gigabit-Ethernet interface configuration mode.
<b>interface tgigaEthernet</b> [slot port]	Enters the 10GE-Ethernet interface configuration mode.

The show interface fastethernet command can be used to show the state of the Ethernet interface, while the show interface gigaethernet command can be used to show the state of the gigabit-Ethernet interface.

## 22.4.2 Setting the Rate

The Ethernet rate can be realized not only through auto-negotiation but also through interface configuration.

Command	Function
<b>Speed</b> {10 100 1000 10000 auto}	Sets the rate of fast Ethernet to 10M, 100M, 1000M or auto-negotiation.
<b>No speed</b>	Resumes the default settings. The rate is auto-negotiation.

### Note:

The speed of the optical interface is fixed. For example, the speeds of GBIC and GE-FX are 1000M, while the speed of FE-FX is 100M. If the speed command for an optical interface has the auto parameter, the optical interface has the automatic negotiation function, or the optical interface is mandatory and cannot be negotiated.

## 22.4.3 Setting the Duplex Mode of an Interface

By default, the Ethernet interface can be auto, half duplex or full duplex. The duplex mode for the gigbit interface is always auto.

Command	Function
<b>duplex</b> {full half auto}	Sets the duplex mode of an Ethernet interface.
<b>No duplex</b>	Resumes the default settings. The duplex mode is auto-negotiation.

## 22.4.4 Setting Flow Control on an Interface

When an interface is in full duplex mode, flow control is realized through the 802.3X-defined PAUSE frame; when an interface is in half duplex mode, flow control is realized through backpressure.

Command	Usage Guidelines
<b>flow-control on/off /atuo</b>	Enables or disables flow control on an interface.
<b>no flow-control</b>	Resumes the default settings, that is, there is no flow control on an interface.

## 22.5 Configuring Logical Interface

This section describes how to configure a logical interface. The contents are as follows:

- Configuring null interface
- Configuring loopback interface.
- Configuring aggregation interface
- Configuring VLAN interface
- Configuring SuperVLAN interface

### 22.5.1 Configuring Null Interface

The whole system supports only one null interface. Its functions are similar to those of applied null devices on most operating systems. The null interface is always available, but it never sends or receives communication information. The null interface provides an optional method to filtrate communication. That is, the unwanted network communication can be routed to the null interface; the null interface can function as the access control list.

You can run the following command in global configuration mode to specify the null interface:

Command	Usage Guidelines
<code>interface null 0</code>	Enters the null interface configuration state.

The null interface can be applied in any command that takes the interface type as its parameter.

The following example shows how to configure a null interface for the routing of IP 192.168.20.0.

```
ip route 192.168.20.0 255.255.255.0 null 0
```

### 22.5.2 Configuring Loopback Interface

The loopback interface is a logical interface. It always functions and continues BGP session even in the case that the outward interface is shut down. The loopback interface can be used as the terminal address for BGP session. If other switches try to reach the loopback interface, a dynamic routing protocol should be configured to broadcast the routes with loopback interface address. Messages that are routed to the loopback interface can be re-routed to the switch and be handled locally. For messages that are routed to the loopback interface but whose destination is not the IP address of the loopback interface, they will be dropped. This means that the loopback interface functions as the null interface.

Run the following command in global configuration mode to specify a loopback interface and enter the interface configuration state:

Command	Usage Guidelines
<code>interface loopback <i>number</i></code>	Enter the loopback interface configuration state.

### 22.5.3 Configuring Aggregation Interface

The aggregator interface is introduced in the background that the bandwidth of a single Ethernet interface is insufficient. It can bind together multiple full-duplex interfaces of the same rate to multiply the bandwidth.

Run the following command to define the aggregation interface:

Command	Function
<b>Interface port-aggregator</b> <i>number</i>	Configuring aggregation interface

## 22.5.4 Configuring VLAN Interface

VLAN interface is the routing interface in switch. The `VLAN` command in global configuration mode only adds layer 2 VLAN to system without defining how to deal with the IP packet whose destination address is itself in the VLAN. If there is no VLAN interface, this kind of packets will be dropped.

Run the following command to define VLAN interface:

Command	Function
<b>Interface vlan</b> <i>number</i>	Configuring VLAN interface

## 22.5.5 Configuring SuperVLAN Interface

The Super VLAN technology provides a mechanism: hosts in different VLANs of the same switch can be allocated in the same IPv4 subnet and use the same default gateway; lots of IP addresses are, therefore, saved. The Super VLAN technology puts different VLANs into a group where VLANs use the same management interface and hosts use the same IPv4 network section and gateway. VLAN belonging to Super VLAN is called as SubVLAN. No SubVLAN can possess the management interface by configuring IP address.

Run the following command to define Super VLAN interface:

Command	Function
<b>Interface superVLAN</b> <i>number</i>	Configuring the superVLAN interface

# Chapter 23 Interface Configuration Example

## 23.1 Configuring Public Attribute of Interface

### 23.1.1 Example for Interface Description

The following example shows how to add a description for an interface.

```
interface vlan 1
ip address 192.168.1.23 255.255.255.0
```

### 23.1.2 Example of Interface Shutdown

The following example shows how to disable GigaEthernet interface 0/1.

```
interface GigaEthernet0/1
shutdown
```

The following example shows how to restart the interface.

```
interface GigaEthernet0/1
no shutdown
```

# Chapter 24 Interface Range Configuration

## 24.1 Interface Range Configuration Task

### 24.1.1 Understanding Interface Range

In the process of configuring interface tasks, there are cases when you have to configure the same attribute on ports of the same type. In order to avoid repeated configuration on each port, we provide the **interface range** configuration mode. You can configure ports of the same type and slot number with the same configuration parameters. This reduces the workload.

**Note:**

when entering the **interface range** mode, all interfaces included in this mode must have been established.

### 24.1.2 Entering Interface Range Mode

Run the following commands to enter the **interface range** mode.

Step	Command	Description
1	<code>interface range type slot&lt;port1 - port2   port3&gt;[ , &lt;port1 - port2 port3&gt;]</code>	Enters the range mode. All ports included in this mode accord to the following conditions: (1) The slot number is set to <b>slot</b> . (2) The port numbers before/after the hyphen must range between port1 and port2, or equal to port3. (3) Port 2 must be less than port 1 (4) There must be space before/after the hyphen or the comma.

### 24.1.3 Configuration Example

Enter the interface configuration mode via the following commands, including slot 0 and fast Ethernet 1,2,3,6,8,10,11,12:

```
switch_config#interface range 1 - 3 , 6 , 8 , 10 - 12
switch_config_if_range#
```

# Chapter 25 Port Additional Characteristics Configuration

## 25.1 Storm Block

In actual application, the Ethernet interface may receive the unknown packets (DLF packets) and the switch then broadcasts by default this kind of packets to all interfaces in a VLAN. This will increase the network load and influence the network capacity. To avoid the DLF packets from being broadcasted, you can set on the egress to drop the DLF packets, which is called storm limit.

Command	Purpose
<code>config</code>	Enters the global configuration mode.
<code>interface g0/1</code>	<b>Enters the to-be-configured port.</b>
<code>[no] switchport block {unicast multicast  broadcast}</code>	Configures the port storm block. <b>Unicast</b> means that storm block is conducted to the unknown unicast packets. <b>Multicast</b> means that storm block is conducted to the multicast packets. <b>Broadcast means that storm block is conducted to the broadcast packets.</b>
<code>exit</code>	<b>Backs to the global configuration mode.</b>
<code>exit</code>	<b>Backs to the EXEC mode.</b>

## 25.2 Port Isolation

Generally, the packets between different ports of a switch can be freely forwarded. In some cases, the data flows between ports need be forbidden and port isolation is then required. Data communication cannot go on between isolated ports, but can do between normal ports or between normal port and isolated port. Data communication cannot go on between the isolated ports within one group, but can do between the isolated port and any arbitrary port outside the group. It is noted that port isolation plays a role in the layer-2 packets. This switch series does not support group-based isolation.

Isolation not based on the group:

Command	Purpose
<code>config</code>	Enters the global configuration mode.
<code>interface g0/1</code>	Enters the to-be-configured port.

[no] <b>switch port protected</b>	Sets or Cancels Port Isolation
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.3 Storm Control

The port of a switch may bear continuous and abnormal impact from unicast (MAC address fails to be found), multicast or broadcast packets, and therefore gets paralyzed even to the extent that the whole switch breaks down. That's why a mechanism must be provided to limit this phenomena. The storm control enables the switch to set on the ingress the rates of different kinds of packets.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	<b>Enters the to-be-configured port.</b>
[no] storm-control {broadcast   multicast   unicast} threshold <b>count</b>	Configures the port storm block. <b>Unicast</b> means that storm control is conducted to the unknown unicast packets. <b>Multicast</b> means that storm control is conducted to the multicast packets. Broadcast means that storm control is conducted to the broadcast packets. <b>Count</b> means to-be-configured threshold.
<b>exit</b>	<b>Backs to the global configuration mode.</b>
<b>exit</b>	<b>Backs to the EXEC mode.</b>

## 25.4 Rate Limit

Rate limit is used to limit the rate of a flow that runs through a port. Run the following command in the EXEC mode to configure the rate limit.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
[no] <b>switchport rate-limit {band   Bandwidth percent} { ingress   egress}</b>	Configures the rate limit for a port. <i>Band</i> is the limited rate. <i>Percent</i> is the limited ratio. <b>ingress</b> means to exert an influence on the ingress.

	<b>egress</b> means to exert an influence on the egress.
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.5 Loopback Detection

Loopback detection is used to check whether loopback exists on an interface. You can configure the interval for a port to transmit the loop check packets. Run the following command in EXEC mode to forward the time interval of the loopback detection packets.

Command	Purpose
config	Enters the global configuration mode.
Interface g0/1	Enters the to-be-configured port.
[no] <b>keepalive</b> [ <i>second</i> ]	To configure the interval for a port to transmit the loop check packets, run <i>keepalive second</i> . <i>second</i> means the interval of transmitting the packets.
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.6 MAC Address Learning

To enable or disable MAC learning on a port, run the following commands.

Command	Purpose
config	Enters the global configuration mode.
interface g0/1	Enters the to-be-configured port.
[no] <b>switchport disable-learning</b>	Configures MAC Learning on a Port. Enable/disable port MAC address learning.
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.7 Port Security

Port security supports security control on an interface. Port security has three modes: dynamic security mode, static reception mode and static rejection mode. In dynamic security mode, you can set the threshold of MAC addresses that can be learned by a port. If the learned MAC addresses on a port have reached the threshold in number, the switch will not learn the MAC addresses any more and at the same time drop all DLF

packets. In static security mode, you can set the static security MAC address on a port and then you should consider two cases: if it is in static reception mode, only the packets whose destination MACs are security MACs can be allowed to enter this port and other packets will be dropped; if it is in static rejection mode, the packets whose destination MACs are security MACs will be all dropped and other packets will be allowed to pass through this port.

Command	Purpose
config	Enters the global configuration mode.
interface g0/1	Enters the to-be-configured port.
[no] <b>switchport port-security mode</b> { <b>dynamic   static accept reject</b> }	Configures the port security mode. Dynamic means the dynamic security mode. <i>static accept</i> means the static reception mode. <i>static reject</i> means the static rejection mode.
[no] <b>switchport port-security dynamic maximum num</b>	Sets the threshold of learning MAC addresses.
[no] <b>switchport port-security static mac-address H.H.H</b>	Sets static security address
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.8 Port Binding

This type of switches can bind the IP address and the MAC address to a port at the same time, and of course you can bind either one to the port.

Run the following commands to enter the EXEC mode:

Command	Purpose
<b>config</b>	<b>Enters the global configuration mode.</b>
<b>interface g0/1</b>	<b>Enters the to-be-configured port.</b>
[no] <b>switchport port-security</b> <b>bind block {ip arp  both-arp-ip</b> <b>A.B.C.D   mac H.H.H}</b>	Configures the port binding function.  <b>bind means that only the packets that comply with the binding requirements can pass while other packets will be dropped; block means that only the packets that comply with the binding requirements will be rejected and other packets will pass.</b>

	<p>Ip means only the ip packets that comply with the binding requirements can pass.</p> <p>Arp means only the arp packets that comply with the binding requirements can pass.</p> <p>both-arp-ip means that ip and arp packets that comply with the binding requirements can pass.</p>
exit	Backs to the global configuration mode.
exit	Backs to the EXEC mode.

## 25.9 VLAN MAC Address Learning

To enable or disable Vlan MAC learning on a port, run the following commands.

Command	Purpose
config	Enters the global configuration mode.
[no] vlan disable-learning < add   remove word   word>	Disable/enable vlan mac address learning Enable/disable vlan mac address learning.
exit	Backs to the EXEC configuration mode.

## 25.10 VLAN MAC Address Learning Number

To configure VLAN MAC Address Learning Number, run the following command:

Command	Purpose
config	Enters the global configuration mode
[no] vlan dynamic vlan <i>word</i> maximum <i>num</i>	<p>Cancels/configures the learnable max number of vlan mac address</p> <p>Word needs to configure vlan of learning address</p> <p>num learnable max mac address num</p>

<b>exit</b>	<b>Exit to management configuration mode</b>
-------------	--

## 25.11 Port FEC

To reduce error rate of 100G port using dual-mode optical module, enable FEC. The function runs with enabled ports on both sides. Disable this function when using the single-mode optical module.

To enter the configuration mode, run the following mode:

<b>Command</b>	<b>Purpose</b>
<b>config</b>	<b>Enters the global configuration mode.</b>
<b>interface cg0/1</b>	<b>Enters the port to be configured.</b>
<b>[no] fec-enable</b>	<b>Configures port FEC.</b>
<b>exit</b>	<b>Exit from the global configuration mode.</b>
<b>exit</b>	<b>Exit from the management configuration mode.</b>

## 25.12 Configuring Link scan

### 25.12.1 Overview

The command is used to scan the time interval on the port. You can fast scan the up/down state on the port.

### 25.12.2 Link Scan Configuration Task

- Configure the time interval on the port.

## Set the time interval of port scan

To set the scan interval of an interface, run the following command in the global configuration mode:

Command	Purpose
<code>[no] Link scan {mode highspeed   normal interval   fast interval }</code>	Mode: optical port scan mode Normal: standard link scan mode Fast link scan mode. Fast mode is mainly used for service protocol requirement, such as rstp. <i>interval</i> : Set the time interval of port scan.
<code>link scan normal time</code>	Sets the time interval of port scan.

### 25.12.3 Configuration Example

The following example shows how to set the scan interval to 20ms.

```
link scan normal 20
```

## 25.13 Configuring system mtu

### 25.13.1 Overview

This is used to configure system mtu.

### 25.13.2 Configuration Task

- Set system mtu.

## Set system mtu

Run the following command in the global configuration mode:

Command	Purpose
[no] system mtu <i>mtu</i>	Set the mtu value of the system.

### 25.13.3 Configuration Example

The following example shows how to set mtu to 1536 bytes.

```
Switch_config#system mtu 1536
```

# Chapter 26 Interface Configuration

## 26.1 Configuring the Ethernet Interface

The switch supports the 10Mbps/100Mbps Ethernet interfaces. See the following content for detailed configuration. Among the configuration, the first step is mandatory while others are optional.

### 26.1.1 Configuring Flow Control for the Port

You can control the flow rate on the incoming and outgoing ports through configuration.

Run the following commands in privileged mode to limit the flow rate of the port.

Each band is defaulted as 128 kbps.

Command	Purpose
<b>configure</b>	Enters the global configuration mode.
<b>interface f1/0</b>	Enters the to-be-configured port.
<b>[no] switchport rate-limit band</b> { ingress egress}	Configures the flow rate limits for the port.  The parameter <b>band</b> represents the to-be-limited flow rate.  The parameter <b>ingress</b> means the function works at the incoming port.  The parameter <b>egress</b> means the function works at the outgoing port.
<b>exit</b>	Exits the global configuration mode.
<b>exit</b>	Returns the EXEC mode.

### 26.1.2 Configuring the Rate Unit for the Port

Run the following commands to modify the rate unit of the flow on a port. The rate unit can be one of these values: 16K, 64K, 128K, 1M, 10M and 40M.

Command	Purpose
<b>Configure</b>	Enters the global configuration mode.
<b>[no] rate-unit count</b>	Configures the rate unit for a port.
<b>exit</b>	Returns the EXEC mode.

### 26.1.3 Configuring the Storm Control on the Port

The ports of the switch may receive the attack by the continuous abnormal unicast (MAC address lookup failing), multicast or broadcast message. In this case, the attacked ports or the whole switch may break down.

The storm control mechanism of the port is therefore generated.

Command	Purpose
<b>storm-control {broadcast   multicast   unicast} threshold count</b>	Performs the storm control to the broadcast/multicast/unicast message.
<b>no storm-control {broadcast   multicast   unicast} threshold</b>	Cancels the storm control.

# Chapter 27 Secure Port Configuration

## 27.1 Overview

You can control the access function of the secure port, enabling the port to run in a certain range according to your configuration. If you enable the security function of a port through configuring the number of secure MAC addresses for the port. If the number of secure MAC addresses exceeds the upper limitation and MAC addresses are insecure, secure port violation occurs. You should take actions according to different violation modes.

The secure port has the following functions:

- Configuring the number of secure MAC addresses
- Configuring static secure MAC addresses
  - If the secure port has no static secure MAC address or the number of static secure MAC addresses is smaller than that of secure MAC addresses, the port will learn dynamic MAC addresses.
- Dropping violated packets when secure port violation occurs

The section describes how to configure the secure port for the switch.

## 27.2 Configuration Task of the Secure Port

- Configuring Secure Port Mode
- [Configuring the Static MAC Address of the Secure Port](#)

## 27.3 Configuring the Secure Port

### 27.3.1 Configuring the Secure Port Mode

There are two static secure port modes: accept and reject. If it is the **accept** mode, only the flow whose source address is same to the local MAC address can be received by the port for communication. If it is the **reject** mode, only the flow whose source address is different to the local MAC address can be received by the port.

Run the following commands in EXEC mode to enable or disable the secure port function:

Command	Purpose
<code>configure</code>	Enters the global configuration mode.
<code>interface g0/1</code>	Enters the to-be-configured port.
<code>[no] switchport port-security mode static {accept   reject}</code>	Configures the secure port mode.
<code>exit</code>	Goes back to the global configuration mode.
<code>exit</code>	Goes back to the EXEC mode.
<code>write</code>	Saves the configuration.

## 27.3.2 Configuring the Static MAC Address of the Secure Port

After you configure the static MAC address of the secure port, In **accept** mode, the flow whose source address is same to the local MAC address can be received by the port for communication. In **reject** mode, the flow whose source address is different to the local MAC address can be received by the port.

Run the following commands in EXEC mode to configure the static MAC address of the secure port:

Command	Purpose
<b>configure</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] switchport port-security static mac-address <i>mac-addr</i></b>	Adds or deletes the static MAC address of the secure port. <ul style="list-style-type: none"><li>• <i>mac-addr</i> is the configured MAC address.</li></ul>
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the configuration.

# Chapter 28 Configuring Port Mirroring

## 28.1 Configuring Port Mirroring Task List

- Configuring port mirroring
- Displaying port mirroring information

## 28.2 Configuring Port Mirroring Task

### 28.2.1 Configuring Port Mirroring

Through configuring port mirroring, you can use one port of a switch to observe the traffic on a group of ports. S2524, S2516 and S2524GX have only one destination port and one source port for mirroring.

Enter the privilege mode and perform the following steps to configure port mirroring:

Command	Description
configure	Enters the global configuration mode.
<b>mirror session</b> <i>session_number</i> { <b>destination</b> { <b>interface</b> <i>interface-id</i> }   <b>source</b> { <b>interface</b> <i>interface-id</i> [,   -]rx }}	Configures port mirroring. <b>session-number</b> is the number of the port mirroring. <b>destination</b> is the destination port of the mirroring. <b>source</b> is the source port of mirroring. <b>rx</b> means the input data of mirroring.
exit	Enters the management mode again.
write	Saves the configuration.

### 28.2.2 Displaying Port Mirroring Information

Run show to display the configuration information of port mirroring.

Command	Description
show mirror [ <i>session session_number</i> ]	Displays the configuration information about port mirroring. <b>session-number</b> is the number of the port mirroring.

## 28.3 Remote Mirroring Configuration Example

The network topology is shown in the following figure:

You need to monitor the traffic of interface g0/1 on switch a and interface g0/1 on switch b by the network analysis meter.

Configure as follows by the remote mirroring:

switch a :

```
mirror session 1 destination interface g0/3 rspan 100 0x8100
mirror session 1 source interface g0/1 both
```

switch b :

```
mirror session 1 destination interface g0/3 rspan 1000 0x8100
mirror session 1 source interface g0/1 both
```

switch c :

```
vlan disable-learning 100,1000
!
interface GigEthernet0/1
switchport mode trunk
!
interface GigEthernet0/2
switchport mode trunk
!
interface GigEthernet0/3
switchport mode trunk
```

```
!  
!  
vlan 1,100,1000  
!
```

switch d :

```
mirror session 1 destination interface g0/2  
mirror session 1 source interface g0/1 both
```

# Chapter 29 Configuring MAC Address Attribute

## 29.1 MAC Address Configuration Task List

- Configuring Static Mac Address
- Configuring Mac Address Aging Time
- Configuring VLAN-shared MAC Address
- Displaying Mac Address Table
- Clearing Dynamic Mac Address

## 29.2 MAC address Configuration Task

### 29.2.1 Configuring Static Mac Address

Static MAC address entries are MAC address entries that do not age by the switch and can only be deleted manually. According to the actual requirements during the operation process, you can add and delete a static MAC address. Use the following command in privileged level to add and delete a static MAC address.

Command	Purpose
<b>configure</b>	Enters the global configuration mode.
<b>[no] mac address-table static mac-addr vlan vlan-id interface interface-id</b>	Adds/deletes a static MAC address entry. Mac-addr indicates the MAC address. Vlan-id indicates the VLAN number. Valid value is from 1~4094. Interface-id indicates the interface name.
<b>exit</b>	Returns to EXEC mode.
<b>write</b>	Saves configuration.

### 29.2.2 Configuring MAC Address Aging Time

When a dynamic MAC address is not used during the specified aging time, the switch will delete this MAC address from the MAC address table. The aging time of the switch MAC address can be configured in terms of needs. The default aging time is 300 seconds.

Configure the aging time of MAC address in the privileged mode as follows:

Command	Purpose
<b>configure</b>	Enters the global configuration mode
<b>mac address-table aging-time [0   10-1000000]</b>	Configures the aging time of MAC address. 0 indicates no-age of the MAC address. Valid value is from 10 to 1000000 in seconds.
<b>exit</b>	Returns to the management mode.
<b>write</b>	Saves configuration.

### 29.2.3 Displaying MAC Address Table

Since debugging and management are required in operation process, we want to know content of the switch MAC address table. Use the show command to display content of the switch MAC address table.

Command	Purpose
<b>show mac address-table</b> {dynamic [interface interface-id   vlan vlan-id]   static}	Displays content of the MAC address table. Dynamic indicates the MAC address that acquires dynamically. Vlan-id indicates the VLAN number. Valid value is from 1 to 4094.  Interface-id indicates the interface name. Static indicates the static MAC address table.

### 29.2.4 Clearing Dynamic MAC Address

The acquired MAC addresses need to be cleared in some circumstances.

Use the following command to delete a dynamic MAC address in privileged mode:

Command	Purpose
<b>clear mac address-table dynamic</b> [address mac-addr   interface interface-id   vlan vlan-id]	Deletes a dynamic MAC address entry. Dynamic indicates the MAC address that dynamically acquires. Mac-addr is the MAC address. Interface-id indicates the interface name. Vlan-id indicates the VLAN number. Valid value is from 1 to 4094.

# Chapter 30 Configuring MAC List

## 30.1 MAC List Configuration Task

### 30.1.1 Creating MAC List

To apply the MAC list on the port, you must first create the MAC list. After the MAC list is successfully created, you log in to the MAC list configuration mode and then you can configure items of the MAC access list.

Perform the following operations to add and delete a MAC list in privilege mode:

Run...	To...
<b>configure</b>	Log in to the global configuration mode.
<b>[no] mac access-list name</b>	Add or delete a MAC list. <b>name</b> means the name of the MAC list.

### 30.1.2 Configuring Items of MAC List

You can use the **permit** or **deny** command to configure the **permit** or **deny** items of the MAC list.

Multiple **permit** or **deny** items can be configured on a MAC list.

The mask of multiple items configured in a MAC list must be the same. Otherwise, the configuration may be out of effect (see the following example). The same item can only be configured once in the same MAC address.

Perform the following operations in MAC list configuration mode to configure the items of the MAC list:

Run...	To...
<b>[no] {deny   permit} {any   host src-mac-addr} {any   host dst-mac-addr}[ethertype]</b>	Add/Delete an item of the MAC list. You can rerun the command to add or delete multiple items of the MAC list. <b>any</b> means any MAC address can be compatible; <b>src-mac-addr</b> means the source MAC address; <b>dst-mac-addr</b> means the destination MAC address. <b>ethertype</b> means the type of matched Ethernet packet.
<b>exit</b>	Log out from the MAC list configuration mode and enter the global configuration mode again.
<b>exit</b>	Enter the management mode again.
<b>write</b>	Save configuration.

## MAC list configuration example

```
Switch_config#mac acce 1
Switch-config-macl#permit host 1.1.1 any
Switch-config-macl#permit host 2.2.2 any
```

The above configuration is to compare the source MAC address, so the mask is the same. The configuration is successful.

```
Switch_config#mac acce 1
Switch-config-macl#permit host 1.1.1 any
Switch-config-macl#permit any host 1.1.2
Switch-config-macl#2003-11-19 18:54:25 rule conflict,all the rule in the acl should match!
```

The first line on the above configuration is to compare source MAC addresses, while the second line is to compare destination MAC addresses. Therefore, the mask is different. The configuration fails.

### 30.1.3 Applying MAC List

The created MAC list can be applied on any physical port. Only one MAC list can be applied to a port. The same MAC list can be applied to multiple ports.

Enter the privilege mode and perform the following operation to configure the MAC list.

Run...	To...
<b>configure</b>	Enter the global configuration mode.
<b>interface f0/1</b>	Log in to the port that is to be configured.
<b>[no] mac access-group name</b>	Apply the created MAC list to the port or delete the applied MAC list from the port. <b>name</b> means the name of the MAC list.
<b>exit</b>	Enter the global configuration mode again.
<b>exit</b>	Enter the management mode again.
<b>write</b>	Save configuration.

## 30.2 802.1x Configuration Example

See the following figure:

Host A connects the G0/2 interface of the SWITCH, host B the G0/3 interface, and host C the G0/4 interface; the radius-server host's IP is 192.168.20.2 and its key is TST; on the G0/2 interface the remote radius authentication, user-bind, accounting and re-authentication will be enabled altogether, on the G0/3 interface the local authentication, eap, multi-hosts and guest-vlan are enabled altogether, and on the G0/4 interface the MAB authentication is used and its MAC address' format is AA:BB:CC:DD:EE:FF.

## Global configuration

```
username switch password 0 TST
username TST password 0 TST
aaa authentication dot1x TST-G0/2 group radius
aaa authentication dot1x TST-G0/3 local
aaa authentication dot1x TST-G0/4 group radius
aaa accounting network dot1x_acc start-stop group radius
dot1x enable
dot1x re-authentication
dot1x timeout re-authperiod 10
dot1x mabformat 2
dot1x guest-vlan
interface VLAN1
ip address 192.168.20.24 255.255.255.0
!
vlan 1-2
radius-server host 192.168.20.2 auth-port 1812 acct-port 1813
radius-server key TST
```

## Configuration of interface f0/2

```
interface GigaEthernet 0/2
dot1x port-control auto
dot1x authentication method TST-G0/2
dot1x user-permit radius-TST
dot1x accounting enable
dot1x accounting method dot1x_acc
```

## Configuration of interface f0/3

```
Interface GigaEthernet 0/3
dot1x authentication multiple-hosts
dot1x port-control auto
dot1x authentication method TST-G0/3
dot1x guest-vlan 2
```

## Configuration of interface f0/4

```
interface GigaEthernet 0/4
dot1x mab
dot1x authentication method TST-G0/4
```

# Chapter 31 VLAN Configuration

## 31.1 VLAN Introduction

The virtual local area network (VLAN) is an exchange network which logically groups the devices in LAN. IEEE issued the IEEE 802.1Q standard in 1999 for realizing the VLAN standard. The VLAN technology can divide a physical LAN logic address into different broadcast domains. Each VLAN has a group of devices which have the same demands but the same attributes with those on the physical LAN. Because it is a logical group, the devices in a same VLAN can be in different physical spaces. The broadcast/unicast flow within a VLAN cannot be forwarded to other VLANs. Such advantages as flow control, low device investment, easy network management and high network security, hence, are obtained.

- Support port-based VLAN
- Support 802.1Q relay mode
- Support the access port

The port-based VLAN is to classify the port into a subset of VLAN supported by the switch. If the VLAN subnet includes only one VLAN, the port is the access port; if the VLAN subnet has multiple VLANs, the port is a trunk port; there is a default VLAN among these VLANs, which is the native VLAN of the port and whose ID is PVID.

- Support VLAN range control

The `vlan-allowed` parameter is used to control the VLAN range; the `vlan-untagged` parameter is used to control the transmission of the untagged VLAN packet from the port to the corresponding VLAN.

VLAN planning modes are various such as based on MAC, IP subnet, protocol, or port. As to these VLAN planning modes, VLAN matchup is conducted by default according to the following order: MAC VLAN, IP-subnet VLAN, protocol VLAN and at last, port VLAN.

## 31.2 Dot1Q Tunnel Overview

### 31.2.1 Preface

Dot1Q Tunnel is a lively name of the tunnel protocol based on 802.1Q encapsulation, which is defined in IEEE 802.1ad. Its core idea is to encapsulate the VLAN tag of the private network to that of the public network, and the packets with two layers of tags traverse the backbone network of ISP and finally a relatively simple L2 VPN tunnel is provided to users. The Dot1Q Tunnel protocol is a simple and manageable protocol, which is realized through static configuration without signaling support and widely applied to enterprise networks consisting of L3 switches or small-scale MAN.

The Dot1Q Tunnel attribute of switches just meets this requirement. As a cheap and compact L2 VPN solution, it is increasingly popular among more and more small-scale users when VPN network is required. At the inside of carrier's network, P device need not support the Dot1Q Tunnel function. That is, traditional L3 switches can meet the requirements fully and protect the investment of the carrier greatly.

- Enables Dot1Q Tunnel globally.

- Supports the inter-translation between customer VLAN and SPVLAN on the downlink port, including translation in Flat mode and in QinQ mode.
- Supports the configuration of the uplink port.
- Supports changeable TPID.

### 31.2.2 Dot1Q Tunnel Realization Mode

There are two modes to realize Dot1Q Tunnel: port-based Dot1Q Tunnel and Dot1Q Tunnel based on inner CVLAN tag classification.

#### 1) Port-based Dot1Q Tunnel:

When a port of this device receives packets, no matter whether packets have the VLAN tag, the switch will add the VLAN tag of the default VLAN on this port to these packets. Thus, if a received packet has a VLAN tag, the packet become a packet with double tags; if a received packet is untagged, this packet will be added a default VLAN tag of this port.

The packet with a single VLAN tag has the following structure, as shown in table 1:

DA (6B)	SA (6B)	ETYPE (8100) (2B)	VLAN TAG (2B)	ETYPE (2B)	DATA (0~1500B)	FCS (4B)
------------	------------	----------------------	------------------	---------------	-------------------	-------------

Table 1 Packet with a single VLAN tag

The packet with double VLAN tags has the following structure, as shown in table 2:

DA (6B)	SA (6B)	ETYPE(8100) (2B)	SPVLAN Tag (2B)	ETYPE (8100) (2B)	CVLAN Tag (2B)	ETYPE (2B)	DATA (0~1500B)	FCS (4B)
------------	------------	---------------------	-----------------------	-------------------------	-------------------	---------------	-------------------	-------------

Table 2 Packet with double VLAN tags

#### 2) Dot1Q Tunnel based on the inner CVLAN Tag:

The service is distributed according to the CVLAN ID zone of the inner CVLAN tag of Dot1Q Tunnel. The CVLAN zone can be translated into SPVLAN ID and there are two translation modes: Flat VLAN translation and QinQ VLAN translation. In QinQ VLAN translation mode, when a same user uses different services by using different CVLAN IDs, the services can be distributed according to CVLAN ID. For example, the CVLAN ID of bandwidth service ranges between 101 and 200; the CVLAN ID of VOIP service ranges between 201~300; and the CVLAN ID of IPTV service ranges between 301~400. When PE device receives the user data, set SPVLAN Tag with ID as 1000 for the bandwidth service; set SPVLAN Tag with ID as 2000 for the VOIP service; set SPVLAN Tag with ID as 3000 for IPTV. The difference of the Flat VLAN translation mode and the QinQ VLAN translation mode is that in the flat VLAN translation mode the SPVLAN tag is not on the out-layer of the CVLAN tag, but replaces the CVLAN tag directly.

### 31.2.3 Modifying Attributes Through TPID Value

The structure of the Tag packet of Ethernet frame that is defined by the IEEE 802.1Q protocol is shown below:

TPID	User Priority	CFI	VLAN ID
------	---------------	-----	---------

Figure 3 Structure of the VLAN Tag of Ethernet frame

TPID is a field in VLAN Tag and the value of this field regulated by IEEE 802.1Q is 0x8100. switches adopt the default TPID value, that is, 0x8100. Some manufacturers do not set the TPID of the outside tag of the Dot1Q Tunnel packets in their devices to 0x8100. In order to be compatible with these devices, most switches provide the function to modify the TPID value of the Dot1Q Tunnel packets. The TPID value of the PE device can be configured by users. After the ports of these devices receive packets, the TPID value of the outside VLAN tag of these packets will be replaced with user-defined value and then these packets will be forwarded. In this way, the Dot1Q Tunnel packets can be identified by the devices of other manufacturer after they are forwarded into the public network.

### 31.3 VLAN Configuration Task List

- Adding/Deleting VLAN
- Configuring the Port of the Switch
- Creating/deleting the VLAN interface
- Configuring the superVLAN interface
- Monitoring the VLAN Configuration and VLAN State
- Configuring the VLAN-based access control model
- Enabling or Disabling Dot1Q Tunnel Globally
- Configuring VLAN translation mode and items on a port
- Setting MAC-Based VLAN
- Setting IP Subnet-Based VLAN
- Setting Protocol-Based VLAN

### 31.4 VLAN Configuration Task

#### 31.4.1 Adding/Deleting VLAN

VLAN is grouped according to different functions, project groups or different applications, not based on the physical locations of these users. VLAN has the similar attributes as the physical LAN, but can group terminals in different physical LANs into a same VLAN. One VLAN can have multiple ports, while all unicast/broadcast/multicast packets can be forwarded or diffused to the terminals through a same VLAN. Each VLAN is a logical network; to forward one packet to another VLAN, the routes or bridge must be used to forward it.

Run the following commands to configure VLAN:

Command	Purpose
<b>vlan</b> <i>vlan-id</i>	Enters theVLANconfiguration mode.
<b>name</b> <i>str</i>	Name in theVLANconfiguration mode
<b>Exit</b>	Exits theVLANconfiguration mode and creates theVLAN.

<b>vlan</b> <i>vlan-range</i>	Creates multiple VLANs simultaneously.
<b>no vlan</b> <i>vlan-id   vlan-range</i>	Deletes one or multiple VLANs.

You can use the GVRP protocol to dynamically add or delete the VLAN.

### 31.4.2 Configuring the Port of the Switch

The switch's port supports the following modes: the access mode, the relay mode, the VLAN tunnel mode, the VLAN translating tunnel mode and the VLAN tunnel uplink mode.

1. The access mode indicates that the port belongs to just one VLAN; only the untagged Ethernet frame can be transmitted and received.
2. The relay mode indicates that the port connects other switches and the tagged Ethernet frame can be transmitted and received.
3. The VLAN translating tunnel mode is a sub mode based on the relay mode. The port looks up the VLAN translation table according to the VLAN tag of received packets to obtain corresponding SPVLAN, and then the switching chip replaces the original tag with SPVLAN or adds the SPVLAN tag to the outside layer of the original tag. When the packets is forwarded out of the port, the SPVLAN will be replaced by the original tag or the SPVLAN tag will be removed mandatorily. Hence, the switch omits different VLAN partitions that access the network, and then passes them without change to the other subnet that connects the other port of the same client, realizing transparent transmission.
4. The VLAN tunnel uplink mode is a sub mode based on the relay mode. The SPVLAN should be set when packets are forwarded out of the port. When the packets are received by the port, their TPIDs will be checked. If difference occurs or they are untagged packets, the SPVLAN tag which contains their own TPID will be added to them as their outer-layer tag. When the packets are received by the port, their TPIDs will be checked. If difference occurs or they are untagged packets, the SPVLAN tag which contains their own TPID will be added to them as their outer-layer tag.

Each port has a default VLAN and PVID; all VLAN-untagged data received on the port belongs to the packets of the VLAN.

The relay mode can group the port to multiple VLANs; at the same time, you can configure the type of to-be-forwarded packets and the quantity of the corresponding VLANs.

Run the following commands to configure the switch's port:

Command	Purpose
<b>switchport pvid</b> <i>vlan-id</i>	Configures PVID of the switch's interface.
<b>switchport mode</b> { <i>access   trunk   dot1q-translating-tunnel   dot1q-tunnel-uplink tpid</i> }	Configures the interface mode of the switch.
<b>switchport trunk vlan-allowed</b> ...	Configures the VLAN range of the switch's interface.
<b>switchport trunk vlan-untagged</b> ...	Configures the untagged VLAN ranges of the switch's port.
<b>switchport flat-translation</b>	To enable flat mode N:1 flat translation function.

### 31.4.3 Creating/deleting the VLAN interface

To realize network management or layer-3 routing, you need create a VLAN interface which can be used for designating the IP address and mask of the interface. Run the following command to

configure the VLAN interface.

Command	Purpose
<b>[no] interface vlan</b> <i>vlan-id</i>	Creates or deletes a VLAN interface.

### 31.4.4 Configuring the Super VLAN Interface

The Super Vlan technology provides the following mechanism: hosts that are in different VLANs but connect the same switch can be distributed to the same IPv4 subnet to use the same default gateway, and therefore lots of IP addresses are saved. The SuperVLAN technology classifies many different VLANs into a group, in which these VLANs use a same management interface and the hosts use a same IPv4 network segment and a same gateway. The VLANs belonging to a SuperVLAN are called SubVLANs, any of which cannot possess a management interface through IP configuration.

A SuperVLAN interface can be configured through the command line; the SuperVLAN interface is configured as follows:

Command	Usage Guidelines
<b>[no] interface supervlan</b> <i>index</i>	<p>Enters the configuration mode of the SuperVLAN interface. If the designated SuperVLAN interface does not exist, the system will create the SuperVLAN interface.</p> <p>The “index” parameter means the index of the SuperVLAN interface, whose valid value ranges from 1 to 32.</p> <p>The “no” parameter means to delete the SuperVLAN interface.</p>
<b>[no] subvlan</b> [ <i>setstr</i> ] [ <b>add</b> <i>addstr</i> ] [ <b>remove</b> <i>remstr</i> ] [ <b>none</b> ]	<p>Configures the SubVlan of the SuperVLAN. The added SubVLAN does not possess a management interface or belong to other SuperVLAN. In initial state SuperVLAN does not contain any SubVLAN. Each time only one subcommand can be used.</p> <p>The “setstr” parameter means to set the SubVLAN list. For example, list 2, 4-6 means VLAN2, VLAN4, VLAN5 and VLAN6.</p> <p>The “add” parameter means to add VLAN lists in the previous SubVLAN; the “addstr” parameter means the list string, whose format is the same above.</p> <p>The “remove” parameter means to delete VLAN lists from the previous SubVLAN list; the “remstr” parameter means the list string, whose format is the same above.</p> <p>The “no” parameter means to delete all SubVLANs of a SuperVLAN. The “no” subcommand cannot be used together with other subcommands.</p>

After a SuperVLAN interface is configured, you can configure an IP address for the SuperVLAN interface; the SuperVLAN interface is also a routing port and any configuration for a port can be configured on this routing port.

### 31.4.5 Monitoring the VLAN Configuration and VLAN State

To monitor the configuration and state of VLAN and Dot1Q tunnel, run the following commands in EXEC

mode:

Command	Purpose
<b>show vlan [ id x   interface intf   dot1q-tunnel [interface intf]   mac-vlan   subnet   protocol-vlan ]</b>	Displays the configuration and state of VLAN or Dot1Q tunnel.
<b>show interface {vlan   supervlan} x</b>	Displays the state of the VLAN interface or that of the SuperVLAN interface.

### 31.4.6 Enabling or disabling Dot1 Q Tunnel globally and configuring TPID globally

After Qot1Q Tunnel is globally enabled, all ports serve as the downlink ports of Qot1Q Tunnel by default and put the SPVLAN tag on the incoming packets.

The command to enable dot1q-tunnel globally:

Command	Purpose
<b>dot1q-tunnel</b>	The command is used to configure dot1q-tunnel globally.

### 31.4.7 enable/disable globalflat-translation

To enable flat-translation globally, the command is

Command	Purpose
<b>[ no ] flat-translation-global</b>	To enable or disable global flat mode N:1 flat translation function, run previous commands.

### 31.4.8 Configuring VLAN translation mode and items on a port

Both the VLAN translating mode and the VLAN translating items validate in dot1q-translating-tunnel mode after they are configured. The translation modes fall into two kinds: the Flat mode and the QinQ mode. In Flat mode, the CLAN tag of packets which are received by the dot1q-translating-tunnel downlink port will be used as an index to look up the VLAN translating list. The CVLAN will be replaced by detected SPVLANS; when the packets are forwarded out of the port, the SPVLAN will then be replaced by CVLAN. In QinQ mode, the CLAN tag of packets which are received by the dot1q-translating-tunnel downlink port will be used as an index to look up the VLAN translating list and then the detected SPVLANS will form into SPVLAN tag to be added to the outside of CVLAN tag; when the packets are forwarded out of the port, the SPVLAN tag will then be removed.

When the VLAN translating items are configured on a port, the mapping between CVLAN and multiple SPVLANS can be configured in QinQ mode. To configure the mapping between CVLAN and multiple SPVLANS in flat mode, you have to configure QoS and then the correct transformation from SPVLAN to CVLAN can be conducted when packets are transmitted out from this port.

The command to configure the VLAN translation mode and translation items is shown in the following

table:

Command	Purpose
<b>switchport dot1q-translating-tunnel mode {flat   qinq} translate {oldvlanid   oldvlanlist} newvlan [priority]</b>	Configures the VLAN translation mode and translation item.

### 31.4.9 Setting MAC-Based VLAN

The MAC-based VLAN is a VLAN planning mode based on the source MAC address of the packet. When a port of a device receives an untagged packet, the device will take the source MAC address of the packet as the matchup keyword and know the home VLAN by looking for the MAC VLAN entry. The settings of the MAC-based VLAN includes adding/deleting MAC VLAN entry and enabling/disabling the MAC VLAN function on the port.

In global configuration mode run the following commands to add or delete the MAC VLAN entry.

Command	Purpose
<b>mac-vlan mac-address <i>mac-addr</i> vlan <i>vlan-id</i> <i>priority</i></b>	<b>Adds a MAC VLAN entry.</b>
<b>no mac-vlan mac-address <i>mac-addr</i></b>	<b>Deletes a MAC VLAN entry.</b>

The MAC-based VLAN function takes effect only on a port on which this function is enabled. In port configuration mode, run the following commands respectively to enable or disable the MAC VLAN function on a port.

Command	Purpose
<b>[no] switchport mac-vlan</b>	To enable or disable the MAC-based VLAN function, run the above-mentioned commands respectively.

Note: In port access mode, an incoming packet will be dropped if its VLAN, which is obtained through the matchup of MAC VLAN entry, is not the PVID of the port. Hence, if not necessary, do not set the port mode, which is to enable MAC VLAN, to access.

### 31.4.10 Setting IP Subnet-Based VLAN

IP subnet-based VLAN is a VLAN planning mode based on the source IP address and configured subnet mask of a packet. When a device receives an untagged packet on one of its ports, the device will locate the VLAN of this packet according to the source IP address of the packet and the configured subnet mask. The settings of the IP-subnet VLAN includes adding/deleting the subnet VLAN entry and enabling/disabling the subnet VLAN function on the port.

In global configuration mode run the following commands to add or delete the subnet VLAN entry.

Command	Purpose
[no] subnet { any   <i>ip-addr mask</i> }	Adds or deletes a subnet VLAN entry.

The IP-subnet VLAN function takes effect only on a port on which this function is enabled. In port configuration mode, run the following commands respectively to enable or disable the MAC VLAN function on a port.

Command	Purpose
[no] switchport vlan-subnet enable	To enable or disable the IP-subnet VLAN function on the ports, run the above-mentioned commands respectively.

Note: In port access mode, an incoming packet will be dropped if its VLAN, which is obtained through the matchup of MAC VLAN entry, is not the PVID of the port. Hence, if not necessary, do not set the port mode, which is to enable subnet VLAN, to access.

### 31.4.11 Setting Protocol-Based VLAN

The protocol-based VLAN is a VLAN planning mode which is based on the protocol to which the received packet belongs. When a switch receives an untagged packet on one of its ports, the switch will determine the VLAN of the packet according to the protocol of this packet.

The way the switch determines the type of the protocol that the packet belongs to is based on the encapsulation type and the value of the special field.

Adding/deleting a protocol template globally and adding/deleting the association of a protocol template on a port

- Adding/deleting a protocol template globally and adding/deleting the association of a protocol template on a port

In global configuration mode, run the following commands to add or delete a protocol template.

Command	Purpose
protocol-vlan <i>protocol_index</i> frame-type { ETHERII   SNAP   LLC } ether-type <i>etype-id</i>	Adds a protocol template.
no protocol-vlan <i>protocol_index</i>	Deletes a protocol template.

Note: When the frame-type parameter is LLC, the high and low bytes in the Ether-Type field correspond to DSAP and SSAP in a packet respectively.

A protocol template only takes effect on a port where the protocol template is applied. The same protocol template can correspond to different VLANs on different ports. In port configuration mode, run the following commands to add or delete the association of a protocol template.

Command	Purpose
switchport protocol-vlan <i>protocol_index</i> vlan <i>vlan-id</i>	Adds the association of a protocol template.

```
no switchport protocol-vlan protocol_index
```

Deletes the association of a protocol template.

## 31.5 Configuration Example

### 31.5.1 SuperVLAN Configuration Example

The network topology is shown in the following figure:

Figure 9 SuperVLAN

Six PC users from PC1 to PC6 connect six ports of a switch respectively. The IP addresses of these PCs belong to the 192.168.1.0/24 network segment. These PCs can ping each other successfully and the switch can be controlled through the IP address, 192.168.1.100, but group PC1-PC3 and group PC4-PC6 are in different layer-2 broadcast domains respectively. In this case, ports 1, 2 and 3 can be configured to be in VLAN1 and ports 4, 5 and 6 to be in VLAN2, and then vlan1 and vlan2 can be added as a SubVLAN of a same SuperVLAN. To do these, you need do the following configurations:

```
interface fastethernet 0/4
switchport pvid 2
!
interface fastethernet 0/5
switchport pvid 2
!
interface fastethernet 0/6
switchport pvid 2
!
interface supervlan 1
subvlan 1,2
ip address 192.168.1.100 255.255.255.0
ip proxy-arp subvlan
!
```

### 31.5.2 Dot1Q Tunnel Configuration Examples

The following typical solutions show how to apply Dot1Q tunnel.

## Example 1

Figure 4 Typical configuration of Dot1Q tunnel

As shown in the figure above, port F0/1 of CE1 connects port F0/1 (or port G0/1) of PE1, PE1 connects S8510 on port F0/2 (or port G0/2), PE2 connects S8510 on port F0/2 (or port G0/2), and port F0/1 (or port G0/1) of PE2 connects port F0/1 of CE1.

Port G0/1 of PE is set to be the access port of VLAN 10 and on them Dot1Q Tunnel is enabled. However, the ports of CE still need Trunk VLAN 200-300, enabling the link between CE and PE to be an asymmetrical link. In this case, the public network only needs to distribute users a VLAN ID, 10. No matter how many VLAN IDs of private network are planned in the user's network, the newly distributed VLAN ID of the public network will be mandatorily inserted into the tagged packets when these packets enter the backbone network of ISP. These packets then pass through the backbone network through the VLAN ID of the public network, reach the other side of the backbone network, that is, the PE devices, get rid of the VLAN tag of the public network, resume the user's packets and at last are transmitted to the CE devices of the users. Therefore, the packets that are forwarded in the backbone network have two layers of 802.1Q tag headers, one being the tag of the public network and the other being the tag of the private network. The detailed flow of packet forwarding is shown as follows:

- 1) Because the egress port of CE1 is a Trunk port, all the packets that are transmitted by users to PE1 have carried the VLAN tag of the private network (ranging from 200 to 300). One of these packets is shown in figure 5.

DA (6B)	SA (6B)	ETYPE (8100) (2B)	VLAN TAG (2B)	ETYPE (2B)	DATA (0~1500B)	FCS (4B)
------------	------------	----------------------	------------------	---------------	-------------------	-------------

Figure 5 Structure of a packet from CE1

- 2) After the packets enter PE1, PE1, for the ingress port is the access port of Dot1Q tunnel, ignores the VLAN tag of the private network but inserts the default VLAN 10's tag into these packets, as shown in figure 6.

DA (6B)	SA (6B)	ETYPE (8100) (2B)	SPVLAN Tag (2B)	ETYPE (8100) (2B)	CVLAN Tag (2B)	ETYPE (2B)	DATA (0~1500B)	FCS (4B)
------------	------------	----------------------	--------------------	-------------------------	-------------------	---------------	-------------------	-------------

Figure 6 Structure of a packet going into PE1

- 3) In the backbone network, packets are transmitted along the port of trunk VLAN 10. The tag of the private network is kept in transparent state until these packets reach PE2.
- 4) PE2 discovers that the port where it connects CE2 is the access port of VLAN 10, removes the tag header of VLAN 10 according to 802.1Q, resumes the initial packets of users, and transmit the initial packets to CE2, as shown in figure 7.

DA (6B)	SA (6B)	ETYPE (8100) (2B)	VLAN TAG (2B)	ETYPE (2B)	DATA (0~1500B)	FCS (4B)
------------	------------	----------------------	------------------	---------------	-------------------	-------------

Figure 7 Structure of a packet from PE2

Seen from the forwarding flow, Dot1Q Tunnel is very concise for the signaling is not required to maintain the establishment of the tunnel, which can be realized through static configuration.

As to the typical configuration figure of Dot1Q Tunnel, products of different models are configured as follows when they run as PE (PE1 configuration is same to PE2).

- 1) Dot1Q Tunnel Configuration of the switch

```
Switch_config#dot1q-tunnel
```

```
Switch_config_g0/1#switchport pvid 10
```

```
Switch_config_g0/2#switchport mode trunk
```

```
Switch_config_g0/2#switchport trunk vlan-untagged 1-9,11-4094
```

## Example 2

If different services of a same user are dealt with and the access terminal of a user connects the UNI port of PE, the Dot1Q tunnel VLAN translation must be used to differentiate different services and carry different QoS standards.

As shown in figure 8, the carrier distributes three VLANs for each user and each VLAN corresponds to a kind of service. For example, user 1 is distributed with 3 VLANs, that is, VLAN 1001, VLAN 2001 and VLAN 3001, among which VLAN 1001 is for broadband services, VLAN 2001 is for VoIP services and VLAN 3001 is for IPTV services. When a service reaches the UNI port of the PE switch, an out-layer label will be added to the service according to its VLAN ID (different services are added with different outer-layer labels). If the out-layer label of the user data is 1001, the user data will be added with label 1001 directly on its outer layer. As to user 2, different services can be distributed with different VLAN tags. The outer-layer tag of user 2 is different from that of user 1 mainly for differentiating the location of CE and also locating users.

Device	Service	Inner-layer CVLAN tag	Outer-layer SPVLAN tag	Flow classification principle
CE1	broadband	101-200	1001	CVLAN domain
	VOIP	201-300	2001	
	IPTV	301-400	3001	
CE2	broadband	101-200	1002	
	VOIP	201-300	2002	
	IPTV	301-400	3002	

In this networking solution, the two layers of tags differentiate services very well and locate users. The outer-layer tag identifies the location of CE and a service, while the inner-layer tag identifies the location of a user.

Figure 8 Typical configuration of Dot1Q tunnel (3)

In figure 9, CE1 connects port G0/1 of PE1, CE2 connects port G0/2 of PE1 and the Dot1Q Tunnel NNI port of PE is port G0/3. Configuring the command as follows:

1) Dot1Q Tunnel Configuration of the switch

```
Switch_config#dot1q-tunnel
Switch_config#vlan 1-4094
Switch_config_g0/1#interface g0/1
Switch_config_g0/1#switchport mode dot1q-translating-tunnel
Switch_config_g0/1#switchport dot1q-translating-tunnel mode QinQ translate 101-200 1001
Switch_config_g0/1#switchport dot1q-translating-tunnel mode QinQ translate 201-300 2001
Switch_config_g0/1#switchport dot1q-translating-tunnel mode QinQ translate 301-400 3001
Switch_config_g0/1#interface g0/2
Switch_config_g0/2#switchport mode dot1q-translating-tunnel
Switch_config_g0/2#switchport dot1q-translating-tunnel mode QinQ translate 101-200 1002
Switch_config_g0/2#switchport dot1q-translating-tunnel mode QinQ translate 201-300 2002
Switch_config_g0/2#switchport dot1q-translating-tunnel mode QinQ translate 301-400 3002
Switch_config_g0/1#interface g0/3
Switch_config_g0/3#switchport mode dot1q-tunnel-uplink
```

## 31.6 Appendix A Abbreviations

Abbrev.	Full Name	Chinese Name
VPN	Virtual Private Network	Virtual Private Network
TPID	Tag Protocol Identifier	Tag Protocol Identifier
QoS	Quality of Service	QoS
P	provider bridged network core	provider bridged network core
PE	provider bridged network edge	provider bridged network edge
CE	customer network edge	customer network edge
UNI	user-network interface	user-network interface
NNI	network-network interface	network-network interface
CVLAN	Customer VLAN	Customer VLAN
SPVLAN	Service provider VLAN	Service provider VLAN

# Chapter 32 Configuring GVRP

## 32.1 Introduction

GVRP (GARP VLAN Registration Protocol GARP VLAN) is a GARP (GARP VLAN Registration Protocol GARP VLAN) application that provides IEEE 802.1Q-compliant VLAN pruning and dynamic VLAN creation on 802.1Q trunk ports.

With GVRP, the switch can exchange the VLAN configuration information with the other GVRP switches, prune the unnecessary broadcast and unknown unicast traffic, and dynamically create and manage the VLANs on the switches that are connected through the 802.1Q trunk ports.

## 32.2 Configuring Task List

### 32.2.1 GVRP Configuration Task List

- Enabling/Disabling GVRP Globally
- Enabling/Disabling GVRP on the Interface
- Monitoring and Maintenance of GVRP

## 32.3 GVRP Configuration Task

### 32.3.1 Enabling/Disabling GVRP Globally

Perform the following configuration in global configuration mode.

Command	Description
[no] gvrp	Enables/disables GVRP globally.

It is disabled by default.

### 32.3.2 Dynamic VLAN to Validate only on a Registered Port

Run the following commands in global configuration mode:

Command	Description
[no] gvrp dynamic-vlan-pruning	Enable/disable VLAN to validate only on a registered port.

After this function is enabled, dynamic VLAN takes effect only on the ports on which this dynamic VLAN is registered. After this command is enabled and if a port has not registered a dynamic VLAN, this port will not belong to the dynamic VLAN even though this port is a trunk port and it allows the dynamic VLAN to pass through.

The function is disabled by default.

### 32.3.3 Enabling/Disabling GVRP on the Interface

Perform the following configuration in interface configuration mode:

Command	Description
---------	-------------

<b>[no] gvrp</b>	Enables/disables interface GVRP.
------------------	----------------------------------

In order for the port to become an active GVRP participant, you must enable GVRP globally first and the port must be an 802.1Q trunk port,  
It is enabled by default.

### 32.3.4 Monitoring and Maintenance of GVRP

Perform the following operations in EXEC mode:

Command	Description
<b>show gvrp statistics [interface port_list]</b>	Displays GVRP statistics.
<b>show gvrp status</b>	Displays GVRP global state information.
<b>[ no ] debug gvrp [ packet   event ]</b>	Enables/disables GVRP data packet and event debug switches. All debug switches will be enabled/disabled if not specified the concrete switch.

Display GVRP statistics:

```
switch#show gvrp statistics interface Tthernet0/1
GVRP statistics on port Ethernet0/1
GVRP Status: Enabled
GVRP Failed Registrations: 0
GVRP Last Pdu Origin: 0000.0000.0000
GVRP Registration Type: Normal
```

Display GVRP global state information:

```
Switch#show gvrp status
GVRP is enabled
```

## 32.4 Configuration Example

The network connection is as follows. In order to make the VLAN configuration information of Switch A and Switch B identical, you can enable GVRP on Switch A and Switch B. The configuration is as follows:

- 1) Configure the interface 1 that Switch A connects to Switch B to trunk:  
`Switch_config_g0/1# switchport mode trunk`
- 2) Enable global GVRP of switch A:  
`Switch_config#gvrp`
- 3) Enable GVRP of interface 1 of Switch A:  
`Switch_config_g0/1#gvrp`
- 4) Configure VLAN 10, Vlan 20 and Vlan30 on Switch A

```
Switch_config#vlan 10,20,30
```

- 5) Configure the interface 2 that Switch A connects to Switch B to trunk:  
`Switch_config_g0/2# switchport mode trunk`
- 6) Enable global GVRP of switch B:  
`Switch_config#gvrp`
- 7) Enable GVRP of interface 2 of Switch B  
`Switch_config_g0/2#gvrp`
- 8) Configure VLAN 40, Vlan 50 and Vlan60 on Switch B

```
Switch_config#vlan 40,50,60
```

After completing the configuration, the VLAN configuration information will be displayed respectively on Switch A and Switch B, that is, VLAN10, VLAN20, VLAN30, VLAN40, VLAN50 and VLAN60 on both switches

# Chapter 33 Private VLAN Settings

## 33.1 Overview of Private VLAN

Private VLAN has settled the VLAN application problems facing ISPs: If ISP provides each user with a VLAN, the support by each device of 4094 VLANs will restrict the total of ISP-supported users.

## 33.2 Private VLAN Type and Port Type in Private VLAN

Private VLAN subdivides the L2 broadcast domain of a VLAN into multiple sub-domains, each of which consists of a private VLAN pair: a primary VLAN and a secondary VLAN. One private VLAN domain may have multiple private VLAN pairs and each private VLAN pair stands for a sub-domain. There is only one primary VLAN in a private VLAN domain and all private VLAN pairs share the same primary VLAN. The IDs of secondary VLANs in each sub-domain differ with each other.

### 33.2.1 Having One Primary VLAN Type

- Primary VLAN: It is relevant to a promiscuous port and only one primary VLAN exists in the private VLAN. Each port in the primary VLAN is a member in the primary VLAN.

### 33.2.2 Having Two Secondary VLAN Types

- Isolated VLAN: No layer-2 communication can be conducted between two ports in the same isolated VLAN. Also, there is only one isolated VLAN in a private VLAN. The isolated VLAN must be related with the primary VLAN.
- Community VLAN: Layer-2 communication can be conducted between two ports in the same VLAN, but they have no communication with the ports in another community VLAN. One private VLAN may contain multiple community VLANs. The community VLAN must be related with the primary VLAN.

### 33.2.3 Port Types Under the Private VLAN Port

- Promiscuous port: it belongs to the primary VLAN. It can communicate with all other ports, including the isolated port and community port of a secondary VLAN in the same private VLAN.
- Isolated port: It is the host port in the isolated VLAN. In the same private VLAN, the isolated port is totally L2 isolated from other ports except the promiscuous port, so the flows received from the isolated port can only be forwarded to the promiscuous port.
- Community port: It is the host port in the community VLAN. In a private VLAN, the community ports of the same community VLAN can conduct L2 communication each other or with the promiscuous port, but not with the community ports of other VLANs and the isolated ports in the isolated VLANs.

### 33.2.4 Modifying the Fields in VLAN TAG

This functionality supports to modify the VLAN ID and priority in VLAN tag and decides whether the egress

packets of private VLAN carry the tag or not.

### 33.3 Private VLAN Configuration Task List

- Configuring Private VLAN
- Configuring the association of private VLAN domains
- Configuring the L2 port of private VLAN to be the host port
- Configuring the L2 port of private VLAN to be the promiscuous port
- Modifying related fields of egress packets in private VLAN
- Displaying the configuration information of private VLAN

### 33.4 Private VLAN Configuration Tasks

The conditions for a private VLAN peer to take effect are listed below:

1. Having the primary VLAN
2. Having the secondary VLAN
  3. Having the association between primary VLAN and secondary VLAN
  4. Having the promiscuous port in primary VLAN

#### 33.4.1 Configuring Private VLAN

Use the following commands to set VLAN to be a private VLAN.

Command	Purpose
<code>vlan <i>vlan-id</i></code>	Enters the VLAN mode.
<code>private-vlan {primary community isolated}</code>	Configures the features of private VLAN.
<code>no private-vlan {primary community isolated}</code>	Deletes the features of private VLAN.
<code>show vlan private-vlan</code>	Displays the configuration of private VLAN.
<code>exit</code>	Exits from Vlan configuration mode.

#### 33.4.2 Configuring the Association of Private VLAN Domains

Run the following commands to associate the primary VLAN and the secondary VLAN.

Command	Purpose
<code>vlan <i>vlan-id</i></code>	Enters the primary VLAN configuration mode.
<code>private-vlan association {<i>svlist</i>   add <i>svlist</i>   remove <i>svlist</i>}</code>	Sets the to-be-associated secondary VLAN.

<code>no private-vlan association</code>	Clears all associations between the current primary VLAN and all secondary VLANs.
<code>exit</code>	Exits the VLAN configuration mode.

### 33.4.3 Configuring the L2 Port of Private VLAN to Be the Host Port

Run the following commands to set the L2 port of private VLAN to be the host port:

Command	Purpose
<code>Interface interface</code>	Enters the interface configuration mode.
<code>switchport mode private-vlan host</code>	Sets the layer-2 port to be in host's port mode.
<code>no switchport mode</code>	Deletes the private VLAN mode configuration of L2 port.
<code>switchport private-vlan host-association p_vid s_vid</code>	Associates the L2 host port with private VLAN.
<code>no switchport private-vlan host-association</code>	Deletes the association between L2 host port and private VLAN.
<code>exit</code>	Exits from the interface configuration mode.

### 33.4.4 Configuring the L2 Port of Private VLAN to Be the Promiscuous Port

Run the following commands to set the L2 port of private VLAN to be the promiscuous port:

Command	Purpose
<code>Interface interface</code>	Enters the interface configuration mode.
<code>switchport mode private-vlan promiscuous</code>	Sets the layer-2 port to be in promiscuous port mode.
<code>no switchport mode</code>	Deletes the private VLAN mode configuration of L2 port.
<code>switchport private-vlan mapping p_vid{svlist   add svlist   remove svlist}</code>	Associates the L2 promiscuous port with private VLAN.

<b>no switchport private-vlan mapping</b>	Deletes the association between L2 promiscuous port and private VLAN.
<b>exit</b>	Exits from the interface configuration mode.

### 33.4.5 Modifying Related Fields of Egress Packets in Private VLAN

Run the following commands to modify related fields of the egress packets in private VLAN:

Command	Purpose
<b>Interface</b> <i>interface</i>	Enters the interface configuration mode.
<b>switchport private-vlan tag-pvid</b> <i>vlan-id</i>	Sets the VLAN ID field in the tag of egress packet.
<b>switchport private-vlan tag-pri</b> <i>pri</i>	Sets the priority field in the tag of egress packet.
<b>[no] switchport private-vlan untagged</b>	Sets whether the egress packets have the tag or not.
<b>exit</b>	Exits from interface configuration mode.

### 33.4.6 Displaying the Configuration Information of Private VLAN

Run the following commands in global, interface or VLAN configuration mode to display the private VLAN configuration information of private VLAN and L2 port:

Command	Purpose
<b>show vlan private-vlan</b>	Displays the configuration of private VLAN.
<b>show vlan private-vlan interface</b> <i>interface</i>	Displays the configuration of the L2 port in the private VLAN.

### 33.5 Configuration Example

Figure 1: Typical Configuration of Private VLAN

As shown in figure 1, port G0/1 is the promiscuous port in primary VLAN 2 and ports G0/2-G0/6 are host ports, among which ports G0/2 and G0/3 are host ports (public ports) of Community VLAN 3, port G0/4 is that of Community VLAN 4, and ports G0/5 and G0/6 are host ports of Isolated VLAN 5.

According to the definition of private VLAN, L2 communication can be conducted between promiscuous port G0/1 and host ports of all sub-VLAN domains, so it is between host ports G0/2 and G0/3 of community VLAN 3, but they cannot conduct L2 communication with other host ports of secondary VLANs. L2 communication cannot go on between ports G0/5 and G0/6 in Isolated VLAN 5, but the two ports can conduct L2 communication with promiscuous port G0/1.

The commands requiring to be entered in a switch are shown below:

```
Switch_config#interface GigaEthernet0/1
Switch_config_g0/1#switchport mode private-vlan promiscuous
Switch_config_g0/1#switchport private-vlan mapping 2 3-5
Switch_config_g0/1#switchport pvid 2

Switch_config#interface GigaEthernet0/2
Switch_config_g0/2#switchport mode private-vlan host
Switch_config_g0/2#switchport private-vlan host-association 2 3
Switch_config_g0/2#switchport pvid 3
```

```
Switch_config#interface GigaEthernet0/3
Switch_config_g0/3#switchport mode private-vlan host
Switch_config_g0/3#switchport private-vlan host-association 2 3
Switch_config_g0/3#switchport pvid 3
```

```
Switch_config#interface GigaEthernet0/4
Switch_config_g0/4#switchport mode private-vlan host
Switch_config_g0/4#switchport private-vlan host-association 2 4
Switch_config_g0/4# switchport pvid 4
```

```
Switch_config#interface GigaEthernet0/5
Switch_config_g0/5#switchport mode private-vlan host
Switch_config_g0/5#switchport private-vlan host-association 2 5
Switch_config_g0/5#switchport pvid 5
```

```
Switch_config#interface GigaEthernet0/6
Switch_config_g0/5#switchport mode private-vlan host
Switch_config_g0/5#switchport private-vlan host-association 2 5
Switch_config_g0/5#switchport pvid 5
```

```
Switch_config#vlan 2
Switch_config_vlan2#private-vlan primary
Switch_config_vlan2#private-vlan association 3-5
```

```
Switch_config#vlan 3
Switch_config_vlan3#private-vlan community
```

```
Switch_config#vlan 4
Switch_config_vlan4#private-vlan community
```

```
Switch_config#vlan 5
```

```
Switch_config_vlan5#private-vlan isolated
```

```
Switch_config#show vlan private-vlan
```

Primary	Secondary	Type	Ports
2	3	community	g0/1, g0/2, g0/3
2	4	community	g0/1, g0/4
2	5	isolated	g0/1, g0/5, g0/6

# Chapter 34 Configuring STP

## 34.1 STP Introduction

The standard Spanning Tree Protocol (STP) is based on the IEEE 802.1D standard. An SWITCH stack appears as a single spanning-tree node to the rest of the network, and all stack members use the same bridge ID.

The spanning-tree algorithm and the spanning-tree protocol can set any bridge LAN to be a simply connected mobile topology. In the mobile topology, some bridge ports can forward frames, while other ports are blocked and cannot forward data. A port in blocked state can also be contained in the mobile topology. When some network device is out of effect, added or removed, the port in blocked state will enter the forwarding state.

In the spanning-tree topology, a bridge is regarded as a root or a root bridge. Each LAN segment has a bridge port to take in charge of data forwarding from this network segment to the root. This bridge port is regarded as the designated port of this LAN segment, while the bridge where the bridge port locates is regarded as the designated bridge of LAN. The root is the designated bridge of each LAN segment that connects this root. In each bridge port, the port that is nearest to the root bridge is the root port of this bridge and only the root port and the designated port are in forwarding state; another kind of ports are open, but they are not root ports or designated ports but standby ports.

The following parameters decide the structure of the stable mobile topology:

- (1) Each unique bridge identifier
- (2) path cost of each port
- (3) ID of each bridge port

The bridge with the highest priority (the identifier value is the smallest) will be chosen as the root bridge. The ports of each bridge in the network all have root path cost, that is, the root path cost is the smallest value of the path cost sum of all ports between the root bridge and the bridge. The designated port of each LAN segment means the port that connect this LAN segment and has the smallest root path cost; if several ports have the same root path cost, their bridge identifiers will first be compared and then their port identifiers. According to this method, each LAN segment has only one designated port and each bridge has only one root port.

The spanning tree topology makes the loop inexistent in a network, guaranteeing the stability and fault recovery of the network. With the wide spread of Ethernet switch, STP plays a more and more important role. Therefore, STP is provided as a basic function of switches.

Rapid Spanning-Tree Protocol (RSTP) is an important update of 802.1D STP. When faults occur in the bridge, bridge port or LAN segment in a network, RSTP will realize the rapid convergence of the network topology. In this case, the new root port on the bridge will enter the forwarding state promptly, and at the same time the direct acceptance between bridges can make a designated port to forward data immediately. Please refer to Chapter 2 for RSTP protocol [Configuring RSTP](#).

This chapter describes how to configure the standard STP of the switch.

---

Note:

802.1D STP and 802.1D RSTP mentioned in this text are simplified as SSTP and RSTP respectively. SSTP here is short for Single Spanning-Tree Protocol.

---

## 34.2 SSTP Configuration Task List

- [Choosing the STP Mode](#)
- [Disabling/Enabling STP](#)
- [Disabling/Enabling STP on a Port](#)
- [Setting the Bridge Priority](#)
- [Setting the Hello Time](#)
- [Setting the Max Age](#)
- [Setting the Forward Delay](#)
- [Setting the Port Priority](#)
- [Value of the path cost of a port](#)
- [Monitoring the STP state](#)
- [Setting the SNMP Trap](#)

## 34.3 SSTP Configuration Tasks

### 34.3.1 Choosing the STP Mode

Run the following command to set the STP mode:

Command	Purpose
<code>spanning-tree mode {sstp   pvst   rstp   mstp}</code>	Selects the STP mode.

### 34.3.2 Disabling/Enabling STP

By default, when STP is started, the running mode is RSTP; if STP is not required, you can stop it from running.

Run the following command to disable STP:

Command	Purpose
<code>no spanning-tree</code>	Disables STP.

Run the following commands to enable STP:

Command	Purpose
<code>spanning-tree</code>	Enables STP that runs in default mode—RSTP.
<code>spanning-tree mode {sstp   pvst   rstp   mstp}</code>	Selects a mode for the enabled STP.

### 34.3.3 Disabling/Enabling STP on a Port

By default, STP is running on all switch ports (physical ports and aggregation ports); if you want to disable STP, you can run the following command in port configuration mode.

Command	Purpose
<code>no spanning-tree</code>	Disables STP to run on the ports.

After STP is forbidden to run on a port, this port maintains a designated port and its forwarding state and stops to transmit BPDU again. However, each STP mode still has such operations as type checkup, numbering, edge information update and topology information update towards BPDU that a port receives.

---

Note:

When no spanning-tree is set and a port has served as a root port, alternate port, master port or backup port, the protocol information that this port receives in RSTP/MSTP mode will age immediately and transfer to be a designated port, while the protocol information that this port receives in SSTP/PVST mode will remain the original role for a certain period and then age after the timer times out.

---

Note:

Every STP mode supports the BPDU Guard function on the port on which no spanning-tree is set.

---

### 34.3.4 Setting the Bridge Priority

You can choose the spanning-tree root of the network topology by changing the bridge priority of a switch.

Run the following commands to set the bridge priority of SSTP:

Command	Purpose
<b>spanning-tree sstp priority</b> <i>value</i>	Modifies the bridge priority of the SSTP mode.
<b>no spanning-tree sstp priority</b>	Resumes the SSTP bridge priority to the default value, 32768.

### 34.3.5 Setting the Hello Time

You can configure the hello time of the SSTP to decide the packet transmission's interval when the switch works as the root.

Run the following commands to set the SSTP hello time.

Command	Purpose
<b>spanning-tree sstp hello-time</b> <i>value</i>	Modifies the hello time in SSTP mode.
<b>no spanning-tree sstp hello-time</b>	Resumes the SSTP hello time to the default value, 2 seconds.

### 34.3.6 Setting the Max Age

You can configure the SSTP max age to decide the maximum lifespan of the packet when the switch works as the root.

Run the following commands to configure the SSTP max age.

Command	Purpose
<b>spanning-tree sstp max-age</b> <i>value</i>	Modifies the Max Age of the SSTP mode.
<b>no spanning-tree sstp max-age</b>	Resumes the max age to the default value, 20 seconds.

### 34.3.7 Setting the Forward Delay

You can configure the forward delay time of the SSTP to decide the state change interval of all switches when these switches work as the root.

Run the following commands to configure the SSTP forward delay.

Command	Purpose
<b>spanning-tree sstp forward-time</b> <i>value</i>	Modifies the forward time of the SSTP mode.
<b>no spanning-tree sstp forward-time</b>	Resumes the default forward time, 15 seconds.

### 34.3.8 Setting the PortPriority

When a loop generates, STP will change the states of some ports to the blocking state to cut off the loop. You can control whether to block a port by setting the port priority and the port path cost.

Run the following commands to set the port priority of SSTP:

Command	Purpose
<b>spanning-tree port-priority</b> <i>value</i>	Sets the port priority in all modes.
<b>spanning-tree sstp port-priority</b> <i>value</i>	Modifies the port priority of the SSTP mode.
<b>no spanning-tree sstp port-priority</b>	Resumes the port priority to the default value, 128.

### 34.3.9 Value of the path cost of a port

Run the following commands to set the port path cost of SSTP.

Command	Purpose
<b>spanning-tree cost</b> <i>value</i>	Sets the port priority in all modes.
<b>spanning-tree sstp cost</b> <i>value</i>	Modifies the port path cost in SSTP mode.
<b>no spanning-tree sstp cost</b>	Resumes the port path cost to the default value.

### 34.3.10 Monitoring the STP state

To monitor STP configuration and STP's state, run the following commands in EXEC mode:

Command	Purpose
<b>show spanning-tree</b>	Displays the state of STP in current mode.
<b>show spanning-tree detail</b>	Displays the detailed information about STP in current mode.
<b>show spanning-tree interface</b>	Displays the information about a port in STP in current mode.

### 34.3.11 Setting the SNMP Trap

You can monitor the change of STP in a switch remotely from the network management software of the host by configuring the trap function of STP.

STP protocols support two types of traps: newRoot and topologyChange. When a switch changes from a non-root to a root, the newRoot Trap message will be transmitted; when the topology change is detected, such as a non-edge port is changed from the non-forwarding state to the forwarding state, the topologyChange Trap message will be transmitted.

---

Note:

The STP trap can be received only when the network management software supports trap reception. The network management need be imported into the bridge MIB and OID is 1.3.6.1.2.1.17.

Run the following commands in global configuration mode to enable the STP trap:

Command	Purpose
<b>spanning-tree management trap</b> [ newroot   topologychange ]	Enables the STP trap. If the trap type is not designated, two kinds of traps will be enabled at the same time.
<b>no spanning-tree management trap</b>	Disables the STP trap.

## 34.4 Setting the Spanning Tree of VLAN

### 34.4.1 Overview

In SSTP mode, the whole network only has one spanning-tree instance, and the state of a port in the spanning tree decides its state in all VLANs. When multiple VLANs exist in a network, the isolation between SSTP and VLAN topology may lead to the communication block of some network parts.

The switch supports that independent SSTP runs on a certain number of VLANs and guarantees that a port has different states in different VLANs. At the same time the flow balance can be realized between VLANs.

It should be noted that the VLAN number which can independently running STP protocol depends on the actual version. Other VLAN topology exceeding the number limit will not be affected by STP.

### 34.4.2 VLAN STP Configuration Tasks

Run the following commands to set the features of SSTP in VLAN:

Command	Purpose
<b>spanning-tree mode pvst</b>	Enables STP distribution according to VLAN.
<b>spanning-tree vlan <i>vlan-list</i></b>	Distributes the STP instance for a designated VLAN. <i>vlan-list</i> means the VLAN list (similarly hereinafter).
<b>no spanning-tree vlan <i>vlan-list</i></b>	Deletes the spanning-tree instance in a designated VLAN
<b>spanning-tree vlan <i>vlan-list</i> priority <i>value</i></b>	Sets the spanning-tree priority in a designated VLAN.
<b>no spanning-tree <i>vlan-list</i> priority</b>	Resumes the spanning-tree priority in a VLAN to the default value.
<b>spanning-tree vlan <i>vlan-list</i> forward-time <i>value</i></b>	Sets the Forward Delay of a designated VLAN.
<b>no spanning-tree vlan <i>vlan-list</i> forward-time</b>	Resumes the Forward Delay of a designated VLAN.
<b>spanning-tree vlan <i>vlan-list</i> max-age <i>value</i></b>	Sets the max age of a designated VLAN.
<b>no spanning-tree vlan <i>vlan-list</i> max-age</b>	Resumes the Max-Age of a designated VLAN to the default value.
<b>spanning-tree vlan <i>vlan-list</i> hello-time <i>value</i></b>	Sets the Hello-time of a designated VLAN.

<b>no spanning-tree vlan <i>vlan-list</i> hello-time</b>	Resumes the hello-time of a designated VLAN to the default value.
--	---

Run the following commands to set the port's features in switch port configuration mode:

Command	Purpose
<b>spanning-tree vlan <i>vlan-list</i> cost</b>	Sets the path cost of a port in a designated VLAN.
<b>no spanning-tree vlan <i>vlan-list</i> cost</b>	Resumes the path cost of a port in VLAN to the default value.
<b>spanning-tree vlan <i>vlan-list</i> port-priority</b>	Sets the port priority in VLAN.
<b>no spanning-tree vlan <i>vlan-list</i> port-priority</b>	Resumes the priority of a port in VLAN to the default value.

In monitor or configuration mode, run the following commands to browse the state of the spanning tree in a designated VLAN:

Command	Purpose
<b>show spanning-tree vlan <i>vlan-list</i></b>	Browses the state of the spanning tree in a VLAN.
<b>show spanning-tree pvst instance-list</b>	To check the corresponding relation between PVST instances and VLAN, run this command.

# Chapter 35 Configuring RSTP

## 35.1 RSTP Configuration Task List

- [Enabling/disabling RSTP of the Switch](#)
- [Setting the Bridge Priority](#)
- [Setting the Forward Time](#)
- [Setting the Hello Time](#)
- [Setting the Max Age](#)
- [Value of the path cost of a port](#)
- [Setting the Port Priority](#)
- [Setting the Edge Port](#)
- [Setting the Port Connection Type](#)
- [Restarting the protocol conversion check](#)

## 35.2 RSTP Configuration Tasks

### 35.2.1 Enabling/disabling RSTP of the Switch

Run the following commands in global configuration mode.

Command	Purpose
<b>spanning-tree mode rstp</b>	Enables RSTP.
<b>no spanning-tree mode</b>	Disables stp funciton.

### 35.2.2 Settingthe Bridge Priority

The bridge priority decides whether this bridge can be chosen as the root bridge of the whole spanning tree. Setting a comparatively low priority can make a bridge to be the root bridge of the spanning tree.

Run the following commands in global configuration mode.

Command	Purpose
<b>spanning-tree rstp priority <i>value</i></b>	Sets the priority of a bridge.
<b>no spanning-tree rstp priority</b>	Resumes the bridge priority to be the default value.

It is especially noted that if the priorities of all bridges in an entire SWITCH network have the same value the bridge with the smallest MAC address will be chosen as the root bridge. In case that RSTP is enabled, if the bridge priority is changed the spanning tree will be calculated again.

In the default settings, the bridge priority is set to 32768.

### 35.2.3 Setting the Forward Time

Link fault will trigger the recalculation of the spanning-tree structure, but the new configuration information, which is obtained through recalculation, cannot be sent to the whole network immediately; if the newly chosen

root port and designated port starts data forwarding immediately, temporary loop may be caused. To solve this problem, RSTP adopts a state removal mechanism. Before the root port and the designated port begin to forward data, an intermediate state must be experienced. The intermediate state changes into the forwarding state after the forward delay that guarantees the new configuration information has spread all over the whole network. The Forward Delay of a bridge depends on the diameter of the SWITCH network. Generally speaking, the longer the network diameter is, the longer the forward delay should be set to be.

Run the following commands in global configuration mode.

Command	Purpose
<b>spanning-tree rstp forward-time</b> <i>value</i>	Sets the Forward Delay.
<b>no spanning-tree rstp forward-time</b>	Resumes the default forward delay, 15 seconds.

It is especially noted that if Forward Delay is set too small the temporary redundant path may occur in the network, but if Forward Delay is set too big the network may be disconnected for a long time. That's why users are recommended to take the default value.

In the default settings, the forward delay of a bridge is 15 seconds.

### 35.2.4 Setting the Hello Time

A suitable hello time not only guarantees that a bridge can detect a link fault in a network promptly but also occupies a few network resources.

Run the following commands in global configuration mode.

Command	Purpose
<b>spanning-tree rstp hello-time</b> <i>value</i>	Sets the Hello Time.
<b>no spanning-tree rstp hello-time</b>	Resumes the hello time to the default value.

It takes attention that if a long hello time is set, packet loss in the links may cause a bridge not to receive the hello packets for a long time and the bridge then regards the occurrence of link faults and starts spanning-tree recalculation, but if a too short hello time is set the bridge will frequently send the configuration information and then the network bandwidth will be heavily occupied and the network/CPU load will be increased. That's why users are recommended to take the default value.

In the default settings, the hello time of a bridge is 2 seconds.

### 35.2.5 Setting the Max Age

The max age is used to judge whether the configuration information expires. Users can set the max age according actual conditions.

Run the following commands in global configuration mode.

Command	Purpose
<b>spanning-tree rstp max-age</b> <i>value</i>	Setting the Max Age
<b>no spanning-tree rstp max-age</b>	Resumes the max age to the default value, 20 seconds.

Link fault, reduces the network auto-adaptivity. We recommend user to use the default value. Note: if you

configure the Max Age to a relatively small value, then the calculation of the spanning tree will be relatively frequent, and the system may regard the network block as link failure. If you configure the Max Age to a relatively big value, then the link status will go unnoticed in time.

The Max Age of bridge is 20 seconds by default.

### 35.2.6 Value of the path cost of a port

The path cost is related with the link rate of the port. If the link rate is required to be high, the path cost should be set to a small value; when the path cost is set to its default value, RSTP can automatically check the link rate of the current Ethernet port and calculate the corresponding path cost.

Run the following commands in interface configuration mode.

Command	Purpose
<b>spanning-tree rstp cost</b> <i>value</i>	Sets the path cost of a port.
<b>no spanning-tree rstp cost</b>	Resumes the path cost of a port to the default value.

It is especially noted that the settings of the path cost will lead to the recalculation of the spanning tree, so users are recommended to take the default value and wait RSTP to calculate the path cost of the current Ethernet port automatically.

By default, the path costs of all Ethernet ports of a bridge are all set to 2000,000 at the 10Mbps port rate, or set to 200,000 at the 100Mbps port rate.

### 35.2.7 Setting the Port Priority

Port priority settings can be used to designate a specific Ethernet port to be contained in the spanning tree. In general, the smaller the value is, the higher the port priority is, and the Ethernet port has more possibility to be contained in the spanning tree. If all Ethernet ports of a bridge adopt the same priority value, the index number of an Ethernet port decides whether the Ethernet port has a high priority or not.

Run the following commands in interface configuration mode.

Command	Purpose
<b>spanning-tree rstp port-priority</b> <i>value</i>	Sets the port priority.
<b>no spanning-tree rstp port-priority</b>	Resumes the port priority to the default value.

It should be noted that the change of the priority of an Ethernet port can lead to the recalculation of the spanning tree.

The priority of all Ethernet ports of a bridge is 128 by default.

### 35.2.8 Setting the Edge Port

The edge port means this port connects terminal devices of a network. A mandatory edge port will enter the forwarding state after link-up. In port configuration mode, run the following command to set the edge port of RSTP:

Command	Purpose
<b>spanning-tree rstp edge</b>	Sets the edge port.

In auto mode, if a port has not received BPDU in a certain time this port is viewed as the edge port.

### 35.2.9 Setting the Port Connection Type

If switches, on which RSTP is run, are in the point-to-point connection, these switches can establish a topology rapidly through the handshake mechanism. When the port connection type is set, the connection of a port can be set point-to-point.

By default, RSTP will judge whether a port is in the point-to-point connection according to the duplex mode of this port. If this port works in full duplex mode, RSTP regards this port is in a point-to-point connection; if this port works in half duplex mode, RSTP regards this port's connection is shared.

If it is confirmed that RSTP or MSTP is running on the switches connected by a port, you should set this port's connection type to point-to-point so that fast handshake should be conducted.

In the port configuration mode, run the following command to set the connection type of a port.

Command	Purpose
<b>spanning-tree rstp point-to-point</b> [ <b>force-true</b>   <b>force-false</b>   <b>auto</b> ]	Sets the point to point interface. force-true: Mandatorily sets the connection to point-to-point. force-false: Mandatorily sets the connection to non-point-to-point. auto: Automatically checks the port type.

### 35.2.10 Restarting the protocol conversion check

RSTP makes a switch to work together with a traditional 802.1D STP switch through a protocol transfer mechanism. If one port of the switch receives the STP configuration message, the port then only transmits the STP message.

After a port enters the STP-compatible state, even if this port does not receive 802.1D STP BPDU again, this port will not resume the RSTP state. In this case, you can run `spanning-tree rstp migration-check` to enable the protocol transfer checkup process and resume this port to the RSTP mode.

In global mode run the following command to restart RSTP transfer checkup:

Command	Purpose
<b>spanning-tree rstp migration-check</b>	Restarts RSTP transfer checkup on all ports.

In switch port configuration mode, run the following command to conduct protocol transfer checkup on this port:

Command	Purpose
<b>spanning-tree rstp migration-check</b>	Restarts RSTP transfer checkup on the current port.

# Chapter 36 Configuring MSTP

## 36.1 MSTP Introduction

### 36.1.1 Overview

Multiple Spanning Tree Protocol (MSTP) is used to establish a simple and complete topology in the bridge LAN. MSTP is compatible with STP (Spanning Tree Protocol) and RSTP (Rapid Spanning Tree Protocol).

Both STP and RSTP only construct a single spanning tree topology in a network and the packets of all VLANs are forwarded along with this unique topology. STP converges too slowly, while RSTP guarantees the a rapid and stable network topology through handshake.

MSTP keeps the fast handshake of RSTP to guarantee fast topology establishment, and at the same time MSTP allows different VLANs to be classified into different spanning trees to establish multiple tree topologies in the network. In a MSTP-constructing network, frames that belong to different VLANs can be forwarded on different paths to realize the load balance of VLAN data.

Different from PVST (per-VLAN Spanning Tree), MSTP permits multiple VLANs to be classified into the same spanning tree topology, effectively reducing spanning trees that are used to support VLANs.

### 36.1.2 MST Region

In MSTP, the relationship of VLAN and spanning tree is described through a MSTP. The MST configuration table, along with a configuration name and a configuration edit number, makes up of a MST configuration identifier.

In a network, the bridges that interconnect with others and possess the same MST configuration identifier are regarded that they are in the same MST region. The bridges in the same MST region generally have the same VLAN settings so that the frames of these VLANs can only be running at the inside of this MST region.

### 36.1.3 IST, CST, CIST and MSTI

Figure 2.1 shows an MSTP network, which consists of 3 MST regions and a switch running 802.1D STP protocol.

Figure 2.1 MSTP topology

## **CIST**

CIST stands for Common and Internal Spanning Tree. Common and Internal Spanning Tree (CIST) means the spanning tree comprised by all single switches and interconnected LAN. These switches may belong to different MST regions. They may be switches running traditional STP or RSTP. Switches running STP or RSTP in the MST regions are considered to be in their own regions.

After the network topology is stable, the whole CIST chooses a CIST root bridge. An internal CIST root bridge will be selected in each region, which is the shortest path from the heart of the region to CIST root.

## **CST**

CST stands for Common Spanning Tree. If each MST region is viewed as a single switch, CST is then the spanning tree that connects these “single switches”. As shown in figure 2.1, regions 1-3 and the STP switch constitute a CST of this network.

## **IST**

IST stands for Internal Spanning Tree. IST means a CIST part in a MST region, or be considered that IST and CST constitute CIST.

## **MSTI**

MSTI stands for Multiple Spanning Tree Instance. MSTP permits different VLANs to be classified into different spanning trees to establish multiple MSTIs. In general, MSTI 0 means CIST, which can be expanded to the whole network, while other MSTIs are each in a region. Each MSTI can be distributed to multiple VLANs. Originally, all VLANs are distributed in CIST.

All MSTIs in the MST region are independent and they can choose different switches to be their roots. For example, in region 3 of figure 2.1, the root of MSTI01 may be the switch at the left bottom corner, while the root of MSTI00 (CIST) may be the switch in the middle.

### **36.1.4 Port Role**

MSTP, like RSTP, has the similar function to conduct port role distribution.

## Root Port

Figure 2.2 Root port

The root port means the path between the current switch to the root bridge. This path has the minimum root path cost.

# Alternate Port

Figure 2.3 Alternate Port

The alternate port serves as path backup between the current switch and the root bridge. When the root port fails to connect, the alternate port can be immediately transferred to be a new root port and start work.

## Designated Port

Figure 2.4 Designated port

The designated port can be used to connect the downstream switch or the downstream LAN and then runs as the path between LAN and the root bridge.

## Backup Port

Figure 2.5 Backup port

When two ports of a switch connect directly or connect the same LAN, the port with relatively low priority will run as the backup port and the other port will run as the designated port. If the designated port invalidates, the backup port will serve as the designated port.

## Master port

Figure 2.6 Master port

The master port is used as the shortest path between MST region and CIST root bridge. The master port is also the root port of the root bridge in CIST region.

## **Boundary Port**

The concept of the boundary port is different from in CIST and in MSTI. In CIST, the boundary port means a port connecting another MST region; while in MSTI, the boundary port means that this spanning tree instance is not extended outside of this port.

## Edge Port

In RSTP and MSTP, the edge port means a port directly connecting the host, and is capable of entering the forwarding state directly without waiting and loop.

Figure 2.7 Edge port

Originally, MSTP, including RSTP, regards all ports are edge ports and therefore the network topology can be established swiftly. If a port in this case receives BPDU from another switch, the port will resume its edge state from its normal state; if it receives 802.1D STP BPDU, it has to wait for double forward delays and then enters its forwarding state.

### 36.1.5 MSTP BPDU

Similar to STP and RSTP, switches running MSTP can communicate with each other through Bridge Protocol Data Unit (BPDU). All configuration information about the CIST and MSTI can be carried by BPDU. Table 2.1 and Table 2.2 list the structure of BPDU used by the MSTP.

Table 2.1 MSTP BPDU

Field Name	Byte Number
Protocol Identifier	1 – 2
Protocol Version Identifier	3
BPDU Type	4
CIST Flags	5

CIST Root Identifier	6 – 13
CIST External Root Path Cost	14 – 17
CIST Regional Root Identifier	18 – 25
CIST Port Identifier	26 – 27
Message Age	28 – 29
Max Age	30 – 31
Hello Time	32 – 33
Forward Delay	34 – 35
Version 1 Length	36
Version 3 Length	37 – 38
Format Selector	39
Configuration Name	40 – 71
Revision	72 – 73
Configuration Digest	74 – 89
CIST Internal Root Path Cost	90 – 93
CIST Bridge Identifier	94 – 101
CIST Remaining Hops	102
MSTI Configuration Messages	103 ~

Table 2.2 MST configuration information

Field Name	Byte Number
MSTI FLAGS	1
MSTI Regional Root Identifier	2 – 9
MSTI Internal Root Path Cost	10 – 13
MSTI Bridge Priority	14
MSTI Port Priority	15
MSTI Remaining Hops	16

### 36.1.6 Stable State

The MSTP switch performs calculation and compares operations according to the received BPDU, and finally ensures that:

- (1) One switch is selected as the CIST root of the whole network.
- (2) Each switch and LAN segment can decide the minimum cost path to the CIST root, ensuring a complete connection and prevent loops.
- (3) Each region has a switch as the CIST regional root. The switch has the minimum cost path to the CIST root.
- (4) Each MSTI can independently choose a switch as the MSTI regional root.
- (5) Each switch in the region and the LAN segment can decide the minimum cost path to the MSTI root.
- (6) The root port of CIST provides the minimum-cost path between the CIST regional root and the CIST root.

- (7) The designated port of the CIST provided its LAN with the minimum-cost path to the CIST root.
- (8) The Alternate port and the Backup port provides connection when the switch, port or the LAN does not work or is removed.
- (9) The MSTI root port provides the minimum cost path to the MSTI regional root.
- (10) The designated port of MSTI provides the minimum cost path to the MSTI regional root.
- (11) A master port provides the connection between the region and the CIST root. In the region, the CIST root port of the CIST regional root functions as the master port of all MSTI in the region.

### 36.1.7 Hop Count

Different from STP and RSTP, the MSTP protocol does not use Message Age and Max Age in the BPDU configuration message to calculate the network topology. MSTP uses Hop Count to calculate the network topology.

To prevent information from looping, MSTP relates the transmitted information to the attribute of hop count in each spanning tree. The attribute of hop count for BPDU is designated by the CIST regional root or the MSTI regional root and reduced in each receiving port. If the hop count becomes 0 in the port, the information will be dropped and then the port turns to be a designated port.

### 36.1.8 STP Compatibility

MSTP allows the switch to work with the traditional STP switch through protocol conversion mechanism. If one port of the switch receives the STP configuration message, the port then only transmits the STP message. At the same time, the port that receives the STP information is then considered as a boundary port.

Note:

When a port is in the STP-compatible state, the port will not automatically resume to the MSTP state even if the port does not receive the STP message any more. In this case, you can run spanning-tree mstp migration-check to clear the STP message that the port learned, and make the port to return to the MSTP state.

The switch that runs the RSTP protocol can identify and handle the MSTP message. Therefore, the MSTP switch does not require protocol conversion when it works with the RSTP switch.

## 36.2 MSTP Configuration Task List

- [Default MSTP Configuration](#)
- [Enabling and disabling MSTP](#)
- [Configuring MSTP region](#)
- [Configuring network root](#)
- [Configuring secondary root](#)
- [Configuring bridge priority](#)
- [Configuring time parameters of STP](#)
- [Configuring network diameter](#)
- [Configuring maximum hop count](#)
- [Configuring port priority](#)
- [Configuring path cost for port](#)

- [Configuring the edge port](#)

## 36.3 MSTP Configuration Tasks

### 36.3.1 Default MSTP Configuration

Attributes	Default Settings
STP mode	RSTP (PVST, SSTP and MSTP is not enabled)
Area name	Its default value is the MAC address of a switch.
Area edit level	0
MST configuration list	All VLANs are mapped to CIST (MST00).
Spanning-tree port priority (CIST and all MSTI)	32768
Spanning-tree port priority (CIST and all MSTI)	128
Path cost of the spanning-tree port (CIST and allMSTI)	1000 Mbps: 20000 100 Mbps: 200000 10 Mbps: 2000000
Hello Time	2 seconds
Forward Delay	15 seconds
Maximum-aging Time	20 seconds
Maximum hop count	20

### 36.3.2 Enabling and disabling MSTP

The STP protocol can be started in RSTP mode by default. You can stop it running when the spanning-tree is not required.

Run the following command to set the STP to the MSTP mode:

Command	Purpose
<b>spanning-tree</b>	Enables STP in default mode.
<b>spanning-tree mode mstp</b>	Enables MSTP.

Run the following command to disable STP:

Command	Purpose
<b>no spanning-tree</b>	Disable the STP.

### 36.3.3 Configuring MSTP region

The MST area where the switch resides is decided by three attributes: configurationname, edit number, the mapping relation between VLAN and MSTI. You can configure them through area configuration commands. Note that the change of any of the three attributes will cause the change of the area where the switch resides. In original state, the MST configuration name is the character string of the MACaddress of the switch. The edit number is 0 and all VLANs are mapped in the CIST (MST00). Because different switch has different MAC address, switches that run MSTP are in different areas in original state. You can run spanning-tree mstp instance instance-id vlan vlan-list to create a new MSTI and map the esignated VLAN to it. If the MSTI is deleted, all these VLANs are mapped to the CIST again.

Run the following command to set the MST area information:

Command	Purpose
<b>spanning-tree mstp name</b> <i>string</i>	Configures the MST configuration name. string means the character string of the configurationname. It contains up to 32 characters, capital sensitive. The default value is the character string of the MAC address.
<b>no spanning-tree mstp name</b>	Sets the MST configuration name to the default value.
<b>spanning-tree mstp revision</b> <i>value</i>	Sets the MST edit number. value represents the edit number, ranging from 0 to 65535. The default value is 0.
<b>no spanning-tree mstp revision</b>	Sets the MST edit number to the default value.
<b>spanning-tree mstp instance</b> <i>instance-id</i> <b>vlan</b> <i>vlan-list</i>	Maps VLAN to MSTI. Instance ID of the spanning-tree, which stands for an MSTI Value range: 1-15 vlan-list: means the VLAN list that is mapped to thespanning tree. It ranges from 1 to 4094. Instance ID is an independent value which stands for an STP instance. vlan-list can represent a group of VLANs, suchas "1,2,3", "1-5" and "1,2,5-10". "1,2: 5 -10"...
<b>no spanning-tree mstp instance</b> <i>instance-id</i>	Cancelsthe VLAN mapping of MSTI and disables thespanning tree instance. instance-id: Instance ID of the spanning-tree, which stands for a MSTI. Value range: 1-15

Run the following command to check the configuration of the MSTP area:

Command	Purpose
<b>show spanning-tree mstp region</b>	Displays the configuration of the MSTP area.

### 36.3.4 Configuring network root

In MSTP, each spanning tree instance has a Bridge ID, containing the priority value and MAC address of the switch. During the establishment of spanning tree topology, the switch with comparatively small bridge ID is selected as the network root.

MSTP can set the switch to the network root through configuration. You can run the command `Spanning-tree mstp instance-id root` to modify the priority value of the switch in a spanning tree instance from the default value (32768) to a sufficiently small value, ensuring the switch turns to be the root in the spanning tree instance.

In general, after the command to set the primary root is executed, the protocol automatically check the bridge ID of the current network's root and then sets the priority of the bridge ID to 24576, which guarantees that the current switch serves as the root of the STP instance.

If the priority value of the network root is less than 24576, the protocol will automatically set the STP priority of the current bridge to a value which is 4096 smaller than the priority of the root. It deserves attention that 4096 is the step of the priority value of the bridge.

When setting the root, you can run the diameter subcommand to the network diameter of the spanning tree network. The keyword is effective only when the spanning tree instance ID is 0. After the network diameter is set, MSTP automatically calculates proper STP time parameters to ensure the stability of network convergence. Time parameters include Forward Delay and Maximum Age. The subcommand `Hello-time` can be used to set a new hello time to replace the default settings.

Run the following command to set the switch to the network root:

Command	Purpose
<code>spanning-tree mstp instance-id root primary</code> [ <code>diameter net-diameter</code> [ <code>hello-time seconds</code> ] ]	Sets the switch to the root in the designated spanning tree instance. instance-id represents the number of the spanning tree instance, ranging from 0 to 15. net-diameter represents the network diameter, which is an optional parameter. It is effective when instance-id is 0. It ranges from 2 to 7. seconds represents the unit of the hello time, ranging from 1 to 10.
<code>no spanning-tree mstp instance-id root</code>	Cancels the root configuration of the switch in the spanning tree. instance-id represents the number of the spanning tree instance, ranging from 0 to 15.

Run the following command to check the MSTP message:

Command	Purpose
<code>show spanning-tree mstp</code> [ <code>instance instance-id</code> ]	Checks the MSTP message.

### 36.3.5 Configuring secondary root

After the network root is configured, you can run `spanning-tree mstp instance-id root secondary` to set one or multiple switches to the secondary roots or the backup roots. If the root does not function for certain reasons, the secondary roots will become the network root.

Different from primary root configuration, after the command to set the secondary root is executed, the protocol directly set the STP priority of the switch to 28672. In case that the priority value of other switches in the network is 32768 by default, the current switch serves as the secondary root.

When configuring the secondary root, you can run the subcommands `diameter` and `hello-time` to update the

STP time parameters. When the secondary root becomes the primary root and starts working, all these parameters starts functioning.

Run the following command to set the switch to the secondary root of the network:

Command	Purpose
<b>spanning-tree mstp</b> <i>instance-id</i> <b>root secondary</b> [ <b>diameter</b> <i>net-diameter</i> [ <b>hello-time</b> <i>seconds</i> ] ]	Sets the switch to the secondary root in the designated spanning tree instance.  instance-id represents the number of the spanning treeinstance, ranging from 0 to 15.  net-diameter represents the network diameter, which is anoptional parameter. It is effective when instance-id is 0. It ranges from 2 to 7.  seconds represents the unit of the hello time, ranging from1 to 10.
<b>no spanning-tree mstp</b> <i>instance-id</i> <b>root</b>	Cancels the root configuration of the switch in the spanning tree.  instance-id represents the number of the spanning treeinstance, ranging from 0 to 15.

Run the following command to check the MSTP message:

Command	Purpose
<b>show spanning-tree mstp</b> [ <b>instance</b> <i>instance-id</i> ]	Checks the MSTP message.

### 36.3.6 Configuring Bridge Priority

In some cases, you can directly set the switch to the network root by configuring the bridge priority. It means that you can set the switch to the network root without running the subcommand root. The priority value of the switch is independent in eachspanning tree instance. Therefore, the priority of the switch can be set independently.

Run the following command to configure the priority of the spanning tree:

Command	Purpose
<b>spanning-tree mstp</b> <i>instance-id</i> <b>priority</b> <i>value</i>	Sets the priority of the switch.  instance-id represents the number of the spanning treeinstance, ranging from 0 to 15.  value represents the priority of the bridge. It can be one ofthe following values:  0, 4096, 8192, 12288, 16384, 20480, 24576, 28672,32768, 36864, 40960, 45056, 49152, 53248, 57344, 61440.
<b>no spanning-tree mstp</b> <i>instance-id</i> <b>priority</b>	Resumes the bridge priority of the switch to the defaultvalue.  instance-id represents the number of the spanning treeinstance, ranging from 0 to 15.

### 36.3.7 Configuring time parameters of STP

The following are STP time parameters:

- **Hello Time :**

The interval to send the configuration message to the designated port when the switch functions as the network root.

- **Forward Delay :**

Time that the port needs when it changes from the Blocking state to the Learning state and to the Forwarding state in STP mode.

- **Max Age :**

The maximum live period of the configuration information about the spanning tree.

To reduce the shock of the network topology, the following requirements for the time parameters must be satisfied:

- $2 \times (\text{fwd\_delay} - 1.0) \geq \text{max\_age}$
- $\text{max\_age} \geq (\text{hello\_time} + 1) \times 2$

Running the following command to set the time parameter of MSTP:

Command	Purpose
<b>spanning-tree mstp hello-time</b> <i>seconds</i>	Resumes Hello Time to the default value. seconds: value range: 1-10 seconds, Default value: 2 seconds
<b>no spanning-tree mstp hello-time</b>	Resumes the hello time to the default value.
<b>spanning-tree mstp forward-time</b> <i>seconds</i>	Sets the parameter Forward Delay. seconds: value range from 4 to 30 seconds, the default value is 15 seconds.
<b>no spanning-tree mstp forward-time</b>	Resumes Forward Delay to the default value.
<b>spanning-tree mstp max-age</b> <i>seconds</i>	Sets the parameter Max Age. seconds: value range from 6 to 40 seconds, the default value is 20 seconds.
<b>no spanning-tree mstp max-age</b>	Resumes the Max Age to the default value.

It is recommended to modify the time parameter of STP through setting the root or network diameter, ensuring the rationality of the time parameter.

The newly-set time parameters are valid even if they do not comply with the previous formula's requirements. Pay attention to the notification on the console when you perform configuration.

### 36.3.8 Configuring network diameter

Network diameter stands for the maximum number of switches between two hosts in the network, representing the scale of the network.

You can set the MSTP network diameter by running the command `spanning-tree mstp diameter net-diameter`. The parameter `net-diameter` is valid only to CIST. After configuration, three STP time parameters is automatically updated to comparatively better values.

Run the following command to configure `net-diameter`:

Command	Purpose
<b>spanning-tree mstp diameter</b> <i>net-diameter</i>	Configure net-diameter. net-diameter: value range: 2-7; default value: 7

<b>no spanning-tree mstp diameter</b>	Resumes net-diameter to the default value.
---------------------------------------	--

The net-diameter parameter is not saved as an independent configuration in the switch. Only the time parameter which is modified through network diameter configuration can be saved.

### 36.3.9 Configuring maximum hop count

Use the following command to configure the max hop-count.

Command	Purpose
<b>spanning-tree mstp max-hops</b> <i>hop-count</i>	Set the maximum hops. hop-count: value range: 6-40 Default value: 20
<b>no spanning-tree mstp max-hops</b>	Resume the maximum hop count to the default value.

### 36.3.10 Setting the Port Priority

If a loop occurs between two ports of the switch, the port with higher priority will enter the forwarding state and the port with lower priority is blocked. If all ports have the same priority, the port with smaller port number will first enter the forwarding state.

In port configuration mode, run the following command to set the priority of the STP port:

Command	Purpose
<b>spanning-tree mstp</b> <i>instance-id</i> <b>port-priority</b> <i>priority</i>	Sets the priority of the STP port. instance-id represents the number of the spanning tree instance, ranging from 0 to 15. priority stands for the port priority. It can be one of the following values: 0, 16, 32, 48, 64, 80, 96, 112 128, 144, 160, 176, 192, 208, 224, 240,
<b>spanning-tree port-priority</b> <i>value</i>	Sets the port priority in all spanning tree instances. value: value of the port priority, which can be one of the following values. 0, 16, 32, 48, 64, 80, 96, 112 128, 144, 160, 176, 192, 208, 224, 240,
<b>no spanning-tree mstp</b> <i>instance-id</i> <b>port-priority</b>	Resumes the port priority to the default value.
<b>no spanning-tree port-priority</b>	Resumes the port priority to the default value in all spanning tree instances.

### 36.3.11 Value of the path cost of a port

In MSTP, the default value of the port's path cost is based on the connection rate. If a loop occurs between two switches, the port with less path cost will enter the forwarding state. The less the path cost is, the higher the rate the port is. If all ports have the same path cost, the port with smaller port number will first enter the forwarding state.

In port configuration mode, run the following command to set the path cost of the port:

Command	Purpose
---------	---------

<b>spanning-tree mstp</b> <i>instance-id cost cost</i>	Sets the path cost of the port. instance-id represents the number of the spanning treeinstance, ranging from 0 to 15. cost stands for the path cost of the port, which ranges from 1 to 200000000.
<b>spanning-tree cost</b> <i>value</i>	Sets the path cost of the port in all spanning tree instances. value: Path cost of a port, which ranges between 1 and 200,000,000
<b>no spanning-tree mstp</b> <i>instance-id cost</i>	Resumes the port path cost to the default value.
<b>no spanning-tree cost</b>	Resumes the path cost of the port to the default value.

### 36.3.12 Setting the Edge Port

The edge port means this port connects terminal devices of a network. A mandatory edge port will enter the forwarding state after link-up. In port configuration mode, run following command to set the edge port of MSTP:

Command	Purpose
<b>spanning-tree mstp edge</b>	Sets the edge port.
<b>no spanning-tree mstp edge</b>	Resume the default setting.

### 36.3.13 Setting the Port Connection Type

If switches, on which RSTP is run, are in the point-to-point connection, these switches can establish a topology rapidly through the handshake mechanism. When the port connection type is set, the connection of a port can be set point-to-point.

By default, RSTP will judge whether a port is in the point-to-point connection according to the duplex mode of this port. If this port works in full duplex mode, RSTP regards this port is in a point-to-point connection; if this port works in half duplex mode, RSTP regards this port's connection is shared.

If it is confirmed that RSTP or MSTP is running on the switches connected by a port, you should set this port's connection type to point-to-point so that fast handshake should be conducted.

In the port configuration mode, run the following command to set the connection type of a port.

Command	Purpose
<b>spanning-tree mstp point-to-point force-true</b>	Sets the port connection mode to point-to-point.
<b>spanning-tree mstp point-to-point force-false</b>	Sets the port connection mode to non-point-to-point.
<b>spanning-tree mstp point-to-point auto</b>	Sets the port connection mode to auto-check (the default mode).
<b>no spanning-tree mstp point-to-point</b>	Resumes the port connection type to the default settings.

### 36.3.14 Activating MST-compatible mode

The MSTP protocol that our switches support is based on IEEE 802.1Q. In order to be compatible with other MSTPs, especially MSTP that the Cisco switches support, the MSTP protocol can work in MST-compatible

mode. Switches running in MSTP-compatible mode can identify the message structure of other MSTPs, check the contained MST regional identifier and establish the MST region.

The MST-compatible mode and the STP-compatible mode are based on MSTP protocol conversion mechanism. If one port of the switch receives BPDU in compatible mode, the port automatically changes to the mode and sends BPDU in compatible mode. To resume the port to standard MST mode, you can run `spanning-tree mstpmigration-check`.

In global configuration mode, run the following commands to enable or disable the MST-compatible mode:

Command	Purpose
<code>spanning-tree mstp mst-compatible</code>	Enable the MST-compatible mode of the switch.
<code>no spanning-tree mstp mst-compatible</code>	Disable the MST-compatible mode of the switch.

---

**Note:**

The main function of the compatible mode is to create the MST area for switches and other MSTP-running switches. In actual networking, make sure that the switch has the same configuration name and the same edit number. It is recommended to configure switches running other MSTP protocols to the CIST root, ensuring that the switch enters the compatible mode by receiving message.

If the MST-compatible mode is not activated, the switch will not resolve the whole BPDU-compatible content and take the content as the common RSTP BPDU. In this way, the switch cannot be in the same area with the MST-compatible switch that it connects.

A port in compatible mode cannot automatically resume to send standard MST BPDU even if the compatible mode is shut down in global configuration mode. In this case, run `migration-check`.

---

### 36.3.15 Restarting the protocol conversion check

MSTP allows the switch to work with the traditional STP switch through protocol conversion mechanism. If one port of the switch receives the STP configuration message, the port then only transmits the STP message. At the same time, the port that receives the STP information is then considered as a boundary port. Likewise, in MST compatible mode, if one interface receives the compatible BPDU, the interface will also forward compatible BPDU.

---

**Note:**

When a port is in the STP-compatible state, the port will not automatically resume to the MSTP state even if the port does not receive the STP message any more. In this case, you can run `spanning-tree mstmigration-check` to clear the STP message that the port learned, and make the port to return to the MSTP state.

---

The switch that runs the RSTP protocol can identify and handle the MSTP message. Therefore, the MSTP switch does not require protocol conversion when it works with the RSTP switch.

In global configuration mode, run the following command to clear all STP information that is detected by all ports of the switch:

Command	Purpose
<code>spanning-tree mstp migration-check</code>	Clears all STP information that is detected by all ports of the switch.

In port configuration mode, run the following command to clear STP information detected by the port.

Command	Purpose
<b>spanning-tree mstp migration-check</b>	Clears STP information detected by the port.

### 36.3.16 Configuring role restriction of the port

The port will not be selected as the root port if the role restriction of the port is enabled.

In the port configuration mode, run the following command to set the role restriction of a port.

Command	Purpose
<b>spanning-tree mstp restricted-role</b>	Sets the port not to be the root port

### 36.3.17 Configuring TCN restriction of the port

The topology change will not be transferred to other port if TCN restriction of the port is enabled.

In the port configuration mode, run the following command to set the TCN restriction of a port.

Command	Purpose
<b>spanning-tree mstp restricted-tcn</b>	Enable the topology changes on one port cannot be transmitted to other ports.

### 36.3.18 Check MSTP information

In monitoring mode, global configuration mode or port configuration mode, run the following command to check all information about MSTP.

Command	Purpose
<b>show spanning-tree</b>	Checks MSTP information. (Information about SSTP, PVST, RSTP and MSTP can be checked)
<b>show spanning-tree detail</b>	Checks MSTP information. (Information about SSTP, PVST, RSTP and MSTP can be checked)
<b>show spanning-tree interface <i>interface-id</i></b>	Checks the STP interface information. (Information about SSTP, PVST, RSTP and MSTP can be checked)
<b>show spanning-tree mstp</b>	Checks all MST instances.
<b>show spanning-tree mstp region</b>	Checks the MST area configuration.
<b>show spanning-tree mstp instance <i>instance-id</i></b>	Checks information about a MST instance.
<b>show spanning-tree mstp detail</b>	Checks detailed MST information.
<b>show spanning-tree mstp interface <i>interface-id</i></b>	Checks MST port configuration.
<b>show spanning-tree mstp protocol-migration</b>	Checks the protocol conversion state of the port.

# Chapter 37 Configuring STP Optional Characteristic

## 37.1 STP Optional Characteristic Introduction

The spanning tree protocol module of the switch supports seven additional characteristics (the so-called optional characteristics). These characteristics are not configured by default. The supported condition of various spanning tree protocol modes towards the optional characteristics are as follows:

Optional Characteristic	Single STP	PVST	RSTP	MSTP
Port Fast	Yes	Yes	No	No
BPDU Guard	Yes	Yes	Yes	Yes
BPDU Filter	Yes	Yes	No	No
Uplink Fast	Yes	Yes	No	No
Backbone Fast	Yes	Yes	No	No
Root Guard	Yes	Yes	Yes	Yes
Loop Guard	Yes	Yes	Yes	Yes

### 37.1.1 Port Fast

Port Fast immediately brings an interface to the forwarding state, bypassing the listening and learning states. In SSTP and PVST mode, you can use Port Fast on interfaces connected to the host or server, to allow those devices to immediately connect to the network.

Port Fast is applicable for connecting ports of the host. As these ports will not receive BPDU and will not affect the network topology, they can enter the forward state without waiting. If the Port Fast function is configured on the interface connecting to the switch, there may cause a loop.

Port Fast Characteristics can be configured in global configuration mode or interface configuration mode. When in global configuration mode, all interfaces will be taken as Port Fast interfaces and fast enter Forwarding state. Thus, it is more likely to cause loop. For avoiding the network loop resulting from Port Fast function, use BPDU Guard or BPDU Filter to protect the interface.

Figure 1.1 Port Fast

Note:

The rapid convergent spanning tree protocol, RSTP and MSTP can immediately bring an interface to the forwarding state, and therefore there is no need to use Port Fast feature.

### 37.1.2 BPDU Guard

If one Port Fast receives BPDU, it may be because of the false network configuration. When one Port Fast receives BPDU, BPDU Guard will protect it passively.

In different STP modes, BPDU Guard acts differently. In SSTP/PVST mode, if a port that has the BPDU Guard function and the Portfast function configured receives BPDU, this port will be mandatorily shut down. You have to configure the port manually to resume this port. In RSTP/MSTP mode, if a BPDU-Guard-configured port receives BPDU, the port will be set to the Blocking state in a period of time.

BPDU Guard characteristics can be configured independent of Port Fast. In all STP modes, the interfaces configured with BPDU Guard will not send BPDU. But the interface can receive BPDU and process it. In RSTP/MSTP mode, you can configure BPDU Guard on the port to ensure the device connected to the switch will not receive BPDU.

BPDU Guard characteristics can be configured in global or interface mode. In global configuration mode, run command `spanning-tree portfast bpduguard` to block all interfaces sending BPDU. Note that inappropriate use of BPDU Guard will cause loop in complicated network.

### 37.1.3 BPDU Filter

With the BPDU filtering characteristic, the switch will block BPDU to send out in SSTP/PVST mode, and also from a protection of the Port Fast.

In SSTP/PVST mode, if a Port Fast port with BPDU filter configured receives the BPDU, the characteristic BPDU Filter and Port Fast at the port will be automatically disabled, resuming the port as a normal port. Before

entering the Forwarding state, the port must be in the Listening state and Learning state.

The same with BPDU Guard, BPDU Filter characteristic can be configured in global configuration mode or in port configuration mode. In global configuration mode, run the command `spanning-tree portfast bpduguard` to block all ports to send BPDU out. The port, however, can still receive and process BPDU.

### 37.1.4 Uplink Fast

The characteristic Uplink Fast enables new root ports to rapidly enter the Forwarding state when the connection between the switch and the root bridge is disconnected.

A complex network always contains multiple layers of devices, as shown in figure 1.2. Both aggregation layer and the access layer of the switch have redundancy connections with the upper layer. These redundancy connections are normally blocked by the STP to avoid loops.

Figure 1.2 Switching network topology

Suppose the connection between a switch and the upper layer is disconnected (called as Direct Link Failure), the STP chooses the Alternate port on the redundancy line as the root port. Before entering the Forwarding state, the Alternate port must be in the Listening state and Learning state. If the Uplink Fast feature is configured by running the command `spanning-tree uplinkfast` in global configuration mode, new root port can directly enter the forwarding state, resuming the connection between the switch and the upper layer.

Figure 1.3 shows the working principle of the Uplink Fast feature. The port for device C to connect device B is the standby port when the port is in the original state. When the connection between device C and root device A is disconnected, the previous Alternate port is selected as new root port and immediately starts forwarding.

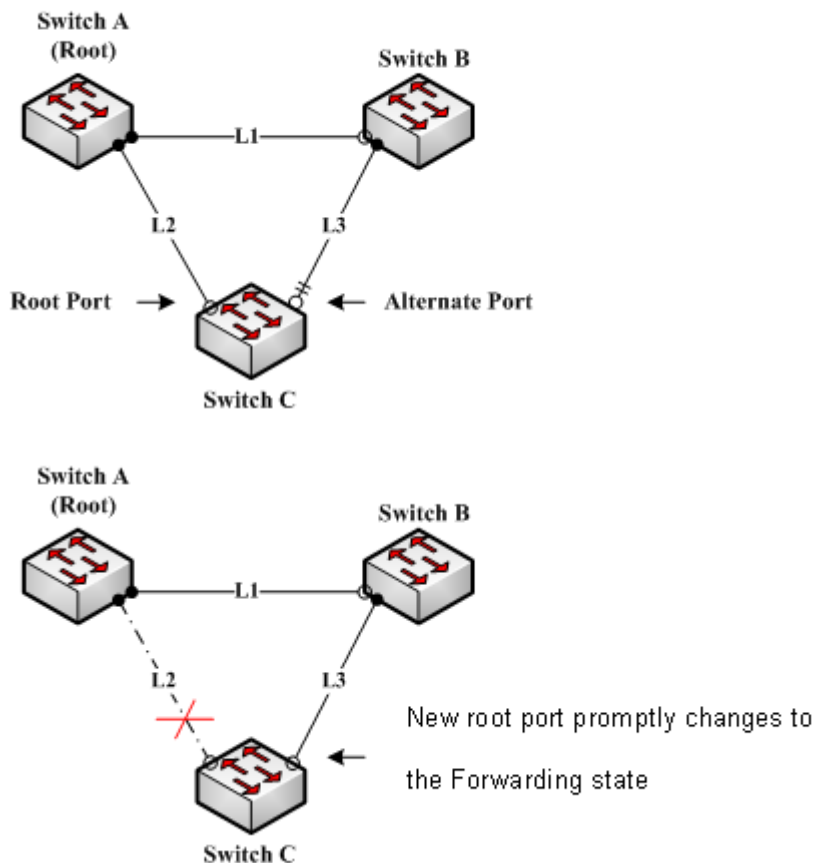

Figure 1.3 Uplink Fast

Note:

The Uplink Fast characteristic adjusts to the slowly convergent SSTP and PVST. In RSTP and MSTP mode, new root port can rapidly enter the Forwarding state without the Uplink Fast function.

### 37.1.5 Backbone Fast

The Backbone Fast characteristic is a supplement of the Uplink Fast technology. The Uplink Fast technology makes the redundancy line rapidly work in case the direct connection to the designated switch is disconnected, while the Backbone Fast technology detects the indirect-link network blackout in the upper-layer network and boosts the change of the port state.

In figure 1.3, Connection L2 between switch C and switch A is called as the direct link between switch C and root switch A. If the connection is disconnected, the Uplink Fast function can solve the problem. Connection L1 between devices A and B is called as the indirect link of device C. The disconnected indirect link is called as indirect failure, which is handled by the Backbone Fast function.

The working principle of the Backbone Fast function is shown in Figure 1.4.

Figure 1.4 Backbone Fast

Suppose the bridge priority of switch C is higher than that of switch B. When L1 is disconnected, device B is selected to send BPDU to device C because the bridge priority is used as root priority. To device C, the information contained by BPDU is not prior to information contained by its own. When Backbone Fast is not enabled, the port between device C and device B ages when awaiting the bridge information and then turns to be the designated port. The aging normally takes a few seconds. After the function is configured in global configuration mode by running the command `spanning-tree backbonefast`, when the Alternate port of device C receives a BPDU with lower priority, device C thinks that an indirect-link and root-device-reachable connection on the port is disconnected. Device C then promptly update the port as the designated port without waiting the aging information.

After the Backbone Fast function is enabled, if BPDU with low priority is received at different ports, the switch will perform different actions. If the Alternate port receives the message, the port is updated to the designated port. If the root port receives the low-priority message and there is no other standby port, the switch turns to be the root switch.

Note that the Backbone Fast feature just omits the time of information aging. New designated port still needs to follow the state change order: the listening state, then the learning state and finally the forwarding state.

Note:

Similar to Uplink Fast, the Backbone Fast characteristic is effective in SSTP and PVST modes.

### 37.1.6 Root Guard

The Root Guard attribute can prevent a port from serving as a root port after it receives a higher-priority BPDU.

In a complicated layer-2 network, the administrator may hope a switch in the core layer as the root of the network, but it cannot manage all switches in the access layer (That's because the switch in the access layer may belong to other clients.) Thus, the inappropriate configuration of other switches may cause the core switch cannot become the root.

To avoid the root role is occupied by switches outside the management area, you can configure Root Guard function on the boundary switch. If an interface configured Root Guard receives information that a higher BPDU is chosen as Port Port, Root Guard will automatically set the port as the blocking state and resumes it as the designated port.

In PVST and MSTP mode, Root Guard can work independently in each STP. In MSTP mode, if a boundary interface in CIST is blocked because of Root Guard, the interface will be blocked in all MSTI. The boundary interfaces are those connected to the LAN host, STP switch, RSTP switch or MSTP switch outside the region. In interface configuration mode, run command **spanning-tree guard root** to enable Root Guard characteristic.

Note:

Root Guard characteristic acts differently somehow in SSTP/PVST and RSTP/MSTP. In SSTP/PVST mode, Root port is always blocked by Root Guard. In RSTP/MSTP mode, Root port won't be blocked until receiving higher level BPDU. A port which formerly plays the Root role will not be blocked.

### 37.1.7 Loop Guard

The Loop Guard attribute can protect a port after it changes from a root port or an alternate port to a designated port. This function can prevent a port from generating a loop when the port cannot receive BPDU continuously. You can enable this feature by using the spanning-tree loopguard default global configuration command. After enabled the command, a Root port or Alternate port will change to designated port and set as the block state. If the port receives high priority BODU in a while, it will resumes from Loop Guard automatically.

In PVST and MSTP mode, Loop Guard can work independently in each STP. In MSTP mode, if a boundary interface in CIST is blocked because of Root Guard, the interface will be blocked in all MSTI.

Note:

Root Guard characteristic acts differently somehow in SSTP/PVST and RSTP/MSTP. In SSTP/PVST mode, designated port is always blocked by Loop Guard. In RSTP/MSTP mode, the port will be blocked when it changes to designated port if it cannot receive BPDU. An interface receiving low priority BPDU and is of the designated role will not be blocked by Loopt Guard.

## 37.2 Configuring STP Optional Characteristic

### 37.2.1 STP Optional Characteristic Configuration Task

- [Configuring Port Fast](#)
- [Configuring BPDU Guard](#)
- [Configuring BPDU Filter](#)
- [Configuring Uplink Fast](#)

- [Configuring Backbone Fast](#)
- [Configuring Root Guard](#)
- [Configuring Loop Guard](#)
- [Configuring Loop Fast](#)
- [Configuring Address Table Aging Protection](#)
- [Configuring FDB-Flush](#)
- [Configuring BPDU Terminal](#)

## 37.2.2 Configuring Port Fast

In SSTP/PVST mode, Port Fast immediately brings an interface to the forwarding state, bypassing the listening and learning states. The function is invalid in other STP mode.

Use the following command to configure the port fast feature in the global configuration mode:

Command	Purpose
<b>spanning-tree portfast default</b>	Globally enables port fast feature. It is valid to all interfaces.
<b>no spanning-tree portfast default</b>	Globally disables port fast feature. It has no effect on the interface configuration.

Note:

The port fast feature only applies to the interface that connects to the host. The BPDU Guard or BPDU Filter must be configured at the same time when the port fast feature is configured globally.

Use the following command to configure the port fast feature in the interface configuration mode:

Command	Purpose
<b>spanning-tree portfast</b>	Disables port fast feature on the interface. It has no effect on the global configuration.
<b>no spanning-tree portfast</b>	Globally disables port fast feature. It has no effect on the interface configuration.

## 37.2.3 Configuring BPDU Guard

BPDU Guard feature acts when receiving BPDU. The interface configured BPDU Guard feature will not send BPDU.

In different STP modes, BPDU Guard acts differently. In SSTP/PVST mode, if a configured port that has the BPDU Guard function and the Portfast function receives BPDU, this port will be shut down mandatorily. You have to configure the port manually to resume this port. In RSTP/MSTP mode, if a BPDU-Guard-configured port receives BPDU, the port will be set to the Blocking state in a period of time.

In global configuration mode, run command BPDU Guard:

Command	Purpose
<b>spanning-tree portfast bpduguard</b>	Globally enables BPDU Guard feature. It is valid to all interfaces.
<b>no spanning-tree portfast bpduguard</b>	Globally disables bpdu guard feature.

Note:

Globally enabling port fast feature may result in broadcast storm. The BPDU Guard or BPDU Filter should be configured for protection sake.

Use the following command to configure the BPDU Guard feature in the interface configuration mode:

Command	Purpose
<b>spanning-tree bpduguard enable</b>	Enables bpdu guard feature on the interface.
<b>spanning-tree bpduguard disable</b>	Disables bpdu guard feature on the interface. It has no effect on the global configuration.
<b>no spanning-tree bpduguard</b>	Disables bpdu guard feature on the interface. It has no effect on the global configuration.

### 37.2.4 Configuring BPDU Filter

With the BPDU filtering characteristic, the switch will block BPDU to send out in SSTP/PVST mode, and also from a protection of the Port Fast.

In global configuration mode, run command BPDU Filter:

Command	Purpose
<b>spanning-tree portfast bpdupfilter</b>	Globally enables BPDU Filter feature. It is valid to all interfaces.
<b>no spanning-tree portfast bpdupfilter</b>	Globally disables BPDU Filter feature.

Note:

Globally enabling port fast feature may result in broadcast storm. The BPDU Guard or BPDU Filter should be configured for protection sake.

Use the following command to configure the BPDU Filter feature in the interface configuration mode:

Command	Purpose
<b>spanning-tree bpdupfilter enable</b>	Enables BPDU Filter feature on the interface.
<b>spanning-tree bpdupfilter disable</b>	Disables BPDU Filter feature on the interface. It has no effect on the global configuration.

<b>no spanning-tree bpdudfilter</b>	Disables BPDU Filter feature on the interface. It has no effect on the global configuration.
-------------------------------------	--

### 37.2.5 Configuring Uplink Fast

The characteristic Uplink Fast enables new root ports to rapidly enter the Forwarding state when the connection between the switch and the root bridge is disconnected.

The Uplink Fast function validates only in SSTP/PVST mode.

In global configuration mode, run command Uplink Fast characteristic:

Command	Purpose
<b>spanning-tree uplinkfast</b>	Enables uplink fast feature.
<b>no spanning-tree uplinkfast</b>	Disables Uplink Fast feature.

### 37.2.6 Configuring Backbone Fast

The Backbone Fast characteristic is a supplement of the Uplink Fast technology. The Uplink Fast technology makes the redundancy line rapidly work in case the direct connection to the designated switch is disconnected, while the Backbone Fast technology detects the indirect-link network blackout in the upper-layer network and boosts the change of the port state.

The backbonefast function validates only in SSTP/PVST mode.

In global configuration mode, run command Backbone Fast characteristic:

Command	Purpose
<b>spanning-tree backbonefast</b>	Enables backbone fast feature.
<b>no spanning-tree backbonefast</b>	Disables backbone fast feature.

### 37.2.7 Configuring Root Guard

The Root Guard attribute can prevent a port from serving as a root port after it receives a higher-priority BPDU. Root Guard characteristic acts differently somehow in SSTP/PVST and RSTP/MSTP. In SSTP/PVST mode, Root port is always blocked by Root Guard. In RSTP/MSTP mode, Root port won't be blocked until receiving higher level BPDU. A port which formerly plays the Root role will not be blocked.

Use the following command to configure the Root Guard feature in the interface configuration mode:

Command	Purpose
<b>spanning-tree guard root</b>	Enables Root Guard feature on the interface.
<b>no spanning-tree guard</b>	Disables root guard and loop guard features on the interface.
<b>spanning-tree guard none</b>	Disables root guard and loop guard features on

	the interface.
--	----------------

### 37.2.8 Configuring Loop Guard

The Loop Guard attribute can protect a port after it changes from a root port or an alternate port to a designated port. This function can prevent a port from generating a loop when the port cannot receive BPDU continuously. Root Guard characteristic acts differently somehow in SSTP/PVST and RSTP/MSTP. In SSTP/PVST mode, designated port is always blocked by Loop Guard. In RSTP/MSTP mode, the port will be blocked when it changes to designated port if it cannot receive BPDU. An interface receiving low priority BPDU and is of the designated role will not be blocked by Loop Guard.

In global configuration mode, run command Loop Guard:

Command	Purpose
<b>spanning-tree loopguard default</b>	Globally enables loop guard feature. It is valid to all interfaces.
<b>no spanning-tree loopguard default</b>	Globally disables loop guard.

Use the following command to configure the Loop Guard feature in the interface configuration mode:

Command	Purpose
<b>spanning-tree guard loop</b>	Enables loop guard feature on the interface.
<b>no spanning-tree guard</b>	Disables root guard and loop guard features on the interface.
<b>spanning-tree guard none</b>	Disables root guard and loop guard features on the interface.

### 37.2.9 Configuring Loop Fast

Note:

Please configure this command under the guide of technical engineers.

Loop Fast feature is applied to improve the network convergence in a limited range in special network environment. For instance, enable Loop Fast feature for all interfaces in the ring network with a dozen of switches.

Run following commands in global mode to configure Loop Fast feature:

Command	Purpose
<b>spanning-tree loopfast</b>	Globally enables Loop Fast feature. It is valid to all interfaces.

<b>no spanning-tree loopfast</b>	Globally disables Loop Fast.
----------------------------------	------------------------------

Use the following command in interface configuration mode to enable Loop Fast:

Command	Purpose
<b>spanning-tree loopfast</b>	Enables loop fast feature on the interface.
<b>no spanning-tree loopfast</b>	Disables Loop Fast feature on the interface.  If the global loop fast is configured, the feature on the interface remains effective.
<b>spanning-tree loopfast disable</b>	Disables Loop Fast on the interface.

### 37.2.10 Configuring Address Table Aging Protection

Under the circumstance of changeable network topology, the configuration of address table aging protection will not affect communication as a result of STP frequently changing the MAC address table.

STPs, such as RSTP and MSTP, will clear the MAC address table of the switch when detecting the STP topology change (delete the old MAC address and update the MAC address), so that the communication can be recovered rapidly. By default, clear action is finished through MAC address table fast aging. Most switches can finish MAC address table fast aging within 1 minute and has little effect on the performance of CPU.

After enabling the address table aging protection function, STP enables protection timer after running the first aging. Before the timeout, another aging will not run. The timer is 15 seconds by default. If the network topology changes within 15 seconds, STP will run a second aging automatically after the timeout.

Note:

The command **no spanning-tree fast-aging** can disable STP running address table aging. Before running the configuration, please ensure the network does not exist loop. Otherwise, the terminal device may need 5 mins or even longer time to resume the communication after the network topology changes.

In global configuration mode, run following command to configure the address table aging protection function.

Command	Purpose
<b>spanning-tree fast-aging</b>	Enable/disable address table aging function.
<b>spanning-tree fast-aging protection</b>	Enable/disable address table aging protection function.
<b>spanning-tree fast-aging protection time</b>	Sets the time of address table aging protection.  Before the time, STP can only run address table aging once.  The default value is 15 second.

Use the no form of this command to resume the default setting

## 37.2.11 Configuring FDB-Flush

Note:

Please configure this command under the guide of technical engineers.

By default, RSTP and MSTP of the switch clear the old MAC address by way of address table fast aging, rather than FDB-Flush.

In global configuration mode, run the following command to configure FDB-Flush:

Command	Purpose
<b>spanning-tree fast-aging flush-fdb</b>	Enable FDB-Flush.
<b>no spanning-tree fast-aging flush-fdb</b>	Disable FDB-Flush.

Note that FDB-Flush is independent of fast aging. FDB-Flush can be configured while no spanning-tree fast-aging is configured. But fast aging protection function has no effect on FDB-Flush.

## 37.2.12 Configuring BPDU Terminal

By default, the device will forward the received BPDU when there is no STP running. BPDU terminal function can forbid forwarding BPDU when there is no STP running.

In global configuration mode, run the following command to configure BPDU Terminal:

Command	Purpose
<b>spanning-tree bpdu-terminal</b>	Enables BPDU Terminal.
<b>no spanning-tree bpdu-terminal</b>	Disables BPDU Terminal.

# Chapter 38 Configuring Port Aggregation

## 38.1 Overview

Link aggregation, also called trunking, is an optional feature available on the Ethernet switch and is used with Layer 2 Bridging. Link aggregation allows logical merge of multiple ports in a single link. Because the full bandwidth of each physical link is available, inefficient routing of traffic does not waste bandwidth. As a result, the entire cluster is utilized more efficiently. Link aggregation offers higher aggregate bandwidth to traffic-heavy servers and reroute capability in case of a single port or cable failure.

Supported Features:

- Static aggregation control is supported  
Bind a physical port to a logical port, regardless whether they can actually bind to a logical port.  
Aggregation control of LACP dynamic negotiation is supported  
Only a physical port that passes the LACP protocol negotiation can bind to a logical port. Other ports won't bind to the logical port.
- Aggregation control of LACP dynamic negotiation is supported  
When a physical port is configured to bind to a logical port, the physical port with LACP negotiation can be bound to a logical port. Other ports cannot be bound to the logical port.
- Flow balance of port aggregation is supported.  
After port aggregation, the data flow of the aggregation port will be distributed to each aggregated physical port.

## 38.2 Port Aggregation Configuration Task

- Configuring logical channel used for aggregation
- Aggregation of physical port
- Selecting load balance mode after port aggregation
- Monitoring the concrete condition of port aggregation

## 38.3 Port Aggregation Configuration Task

### 38.3.1 Configuring Logical Channel Used to Aggregation

You should establish a logical port before binding all the physical ports together. The logical port is used to control the channel formed by these binding physical ports.

Use the following command to configure the logical channel:

Command	Description
<code>interface port-aggregator id</code>	Configures aggregated logical channel.

### 38.3.2 Aggregation of Physical Port

To aggregate multiple physical ports into a logical channel, you can use static aggregation or LACP protocol for negotiation.

In the case when the static aggregation is used, it is required that the link of the physical port should be up, and the VLAN attribute of aggregation port and physical port should be identical, and then this port will be

aggregated to the logical channel, regardless of whether the current port accords with the conditions of port aggregation and whether the port that connects with the physical port accords with the aggregation conditions.

Prerequisites for ports to be aggregated:

- The link of the port must be up and the port should be negotiated to full-duplex mode.
- The speed of all physical ports should be same during aggregation process, that is, if there is one physical port that has been aggregated successfully, then the speed of the second physical port must be the same as the first configured one. Also the vlan attributes of all physical ports must be identical to the aggregated port.

LACP packets are exchanged between ports in these modes:

- Active—Places a port into an active negotiating state, in which the port initiates negotiations with remote ports by sending LACP packets.
- Passive—Places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP negotiation. In this mode, the port channel group attaches the interface to the bundle.

If both ports use Passive method, then the aggregation fails. This is because both sides will wait for the other side to launch aggregation negotiation process.

VALN attributes: PVID, Trunk attribute, vlan-allowed range and vlan-untagged range.

Use the following command to perform aggregation on the physical ports:

Command	Description
<b>aggregator-group</b> <i>agg-id</i> <b>mode</b> { <b>lACP</b>   <b>static</b> }	Configures aggregation option of the physical port.

### 38.3.3 Selecting Load Balance Method After Port Aggregation

You can select the load share method to ensure that all ports can share the data traffic after the aggregation of all physical ports. The switch can provides up to six load balance strategy:

- **src-mac**  
It is to share the data traffic according to the source MAC address, that is, the message with same MAC address attributes is to get through a physical port.
- **dst-mac**  
It is to share the data traffic according to the destination MAC address, that is, the message with same MAC address attributes is to get through a physical port.
- **both-mac**  
It is to share the data traffic according to source and destination MAC addresses, that is, the message with same MAC address attributes is to get through a physical port.
- **src-ip**  
It is to share the data traffic according to the source IP address, that is, the message with same IP address attributes is to get through a physical port.
- **dst-ip**  
It is to share the data traffic according to the destination IP address, that is, the message with same IP address attributes is to get through a physical port.
- **both-ip**  
It is to share the data traffic according to the destination and source IP addresses, that is, the message with same IP address attributes is to get through a physical port.

Use the following command to configure load balance method:

Command	Description
<b>aggregator-group load-balance</b>	Configures load balance method.

**Note:**

The command is unavailable at the switch that does not support load balance methods or supports only one method. The switch using the command only selects the load balance strategies supported by itself.

The following table shows different switches support different kinds of load balance strategies:

Model	src-mac	dst-mac	both-mac	src-ip	dst-ip	both-ip
<b>S2008, S2116, S2026B</b>	x	x	x	x	x	x
<b>S2224D</b>	√	√	√	x	x	x
<b>S2224M, S2226, S2448</b>	√	√	√	√	√	√
<b>S2516, S2524, S2524GX</b>	√	√	x	x	x	√
<b>S2448B, S2226C</b>	√	√	√	x	x	x
<b>S3224, S3224M S3424, S3448 S3512</b>	√	√	√	√	√	√
<b>S6508</b>	√	x	x	x	x	x
<b>S8500</b>	√	√	√	√	√	√

### 38.3.4 Monitoring the Concrete Conditions of Port Aggregation

Use the following command to monitor port aggregation state in EXEC mode:

Command	Description
<b>show aggregator-group</b>	Displays port aggregation state.

# Chapter 39 PDP Overview

## 39.1 Overview

PDP is specially used to discover network equipment, that is, it is used to find all neighbors of a known device. Through PDP, the network management program can use SNMP to query neighboring devices to acquire network topology.

Our company's switches can discover the neighboring devices but they do not accept SNMP queries. Therefore, switches only run at the edge of network, or they cannot acquire a complete network topology.

PDP can be set on all SNAPs (e.g. Ethernet).

## 39.2 PDP Configuration Tasks

- Default PDP Configuration
- Setting the PDP Clock and Information Storage
- Setting the PDP Version
- Starting PDP on a Switch
- Starting PDP on a Port
- PDP Monitoring and Management

### 39.2.1 Default PDP Configuration

Function	Default Settings
Global configuration mode	This function is not enabled by default.
Interface configuration mode	Starts up.
PDP clock (packet transmission frequency)	60 seconds
PDP information storage	180 seconds
PDP version	2

### 39.2.2 Setting the PDP Clock and Information Storage

To set the PDP packet transmission frequency and the PDP information storage time, you can run the following commands in global configuration mode.

Command	Purpose
pdp timer seconds	Sets the transmission frequency of the PDP packets.
pdp holdtime seconds	Sets the PDP information storage time.

### 39.2.3 Setting the PDP Version

To set the PDP version, you can run the following command in global configuration mode.

Command	Purpose
pdp version {1 2}	Setts the PDP version.

### 39.2.4 Starting PDP on a Switch

To enable PDP, you can run the following commands in global configuration mode.

Command	Purpose
pdp run	Starts PDP on a switch.

### 39.2.5 Starting PDP on a Port

To enable PDP on a port by default, you can run the following command in port configuration mode.

Command	Purpose
pdp enable	Starts PDP on a port of a switch.

### 39.2.6 PDP Monitoring and Management

To monitor the PDP, run the following commands in EXEC mode:

Command	Purpose
show pdp traffic	Displays the counts of received and transmitted PDP packets.
show pdp neighbor [detail]	Displays neighbors that PDP discovers.

## 39.3 PDP Configuration Example

Example 1: Starting PDP

```
Switch_config# pdp run
Switch_config# int f0/1
Switch_config_f0/1#pdp enable
```

Example 2: Setting the PDP clock and information storage

```
Switch_config#pdp timer 30
Switch_config#pdp holdtime 90
```

Example 3: Setting the PDP version

```
Switch_config#pdp version 1
```

Example 4: Monitoring PDP

```
Switch_config#show pdp neighbor
```

Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge  
S - Switch, H - Host, I - IGMP, r - Repeater

Device-ID	Local-Intf	Hldtme	Port-ID	Platform	Capability
Switch	Fas0/1	169	Gig0/1	COMPANY, RISC	R S

# Chapter 40 Link Layer 2 Discovery Protocol (LLDP)

## 40.1 LLDP Overview

802.1AB The link layer discovery protocol (LLDP) at 802.1AB helps to detect network troubles easily and maintain the network topology. It enables the neighboring device to send out notice of its own state information to other devices and each port of all devices stores information of defining themselves. If necessary, they can also send update information to the neighboring devices and the neighboring devices will store the information in standard SNMP MIBs. The network management system can inquire the connection of current layer-2 from MIB. LLDP can neither configure nor control the network element or traffic. It only reports configuration of layer-2.

Simply, LLDP is a neighbor discovery protocol. It sets a standard method for the Ethernet network device, such as switches, routers and WAPs. It enables the Ethernet device to notify its existence to other nodes and save the discovery information of neighboring devices. For instance, all information including the device configuration and the device identification can be notified through the protocol. Specifically, LLDP defines a universal notification information set, a transmission notification protocol and a method of storing all notification information. The device needs to notify the notification information can transmit many notifications in a LAN data packet. The transmission type is TLV.

TLV has three compulsory types: Chassis ID TLV, Port ID TLV and Time To Live TLV; five optional types: Port Description, System Name, System Description, System Capabilities and Management Address; and three extension TLVs: DOT1 (Port Vlan ID, Protocol Vlan ID, Vlan Name, Protocol Identity); DOT3 (MAC/PHY Configuration/Status, Power Via MDI, Link Aggregation, Max Frame Size); MED (MED Capability, Network Policy, Location Identification, Extended Power-via-MDI, Inventory (Hardware Revision, Firmware Revision, Software Revision, Serial Number, Manufacturer Name, Mode Name, Assert ID)).

LLDP is a unidirectional protocol. One LLDP agent transmits its state information and functions through its connected MSAP, or receives the current state information or function information about the neighbor. However, the LLDP agent cannot request any information from the peer through the protocol. During message exchange, message transmission and reception do not affect each other. You can configure only message transmission or reception or both.

## 40.2 Initializing the Protocol

LLDP can work under three modes: transmit-only, receive-only and transmit-and-receive. The default mode is transmit-and-receive.

### 40.2.1 Initializing LLDP Transmit Mode

Set LLDP to transmit-only in the interface mode. In transmit-only mode, the interface transmits LLDP packets when the state or value of one or more information elements (management object) of the local system change or the transmission timer is timeout. The interface will not transmit LLDP packets when disabling the

function.

## 40.2.2 Initializing LLDP Reception Mode

Set LLDP to receive-only in the interface mode. In receive-only mode, the interface can receive LLDP packets from the neighbors and save tlv into the remote MIB. The interface will drop LLDP packets when disabling the function.

## 40.2.3 LLDP PDU Packet Structure Description

In accordance with the order, LLDP PDU includes three compulsory TLVs in the front, one or more optional TLV in the middle and LLDPUD TLV in the end. As shown in figure 1:

M must include TLV.

Figure 1 LLDP PDU Format

(1) Three compulsory TLVs should be listed in sequence at the beginning of LLDP PDU:

1. Chassis ID TLV
2. Port ID TLV
3. Time To Live TLV

(2) Optional TLV selected by the network management can be listed randomly.

4. Port Description
5. System Name
6. System Description
7. System Capabilities
8. Management Address

Three extensions (including DOT1):

9. Port Vlan ID
10. Protocol Vlan ID
11. Vlan Name
12. Protocol Identity

DOT3:

13. MAC/PHY Configuration/Status
14. Power Via MDI
15. Link Aggregation
16. Max Frame Size

MED (TLV of MED is not transmitted by default. LLDP packets with MED TLV will be transmitted only when LLDP packets with MED TLV are received.)

17. MED Capability (TLV is compulsory if MED TLV is added.)
18. Network Policy

- 19. Location Identification
  - 20. Extended Power-via-MDI
  - 21. Inventory (包含 Hardware Revision、Firmware Revision、Software Revision、Serial Number、Manufacturer Name、Mode Name、Assert ID)
- (3) The end TLV should be the last one in LLDP PDU.

## 40.3 LLDP Configuration Task List

- Disabling/enabling LLDP
- Configuring holdtime
- Configuring Timer
- Configuring Reinit
- Configuring the To-Be-Sent TLV
- Configuring the Transmission or Reception Mode
- Specifying the Management IP Address of a Port
- Sending Trap Notification to mib Database
- Configuring Show-Relative Commands
- Configuring the Deletion Commands

## 40.4 LLDP Configuration Tasks

### 40.4.1 Disabling/enabling LLDP

LLDP is disabled by default. You need to start up LLDP before it runs. After enabling LLDP, the local port regularly forwards lldp frame to notify the information of the opposite local port.

Run the following commands in global configuration mode to enable LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp run	Runs LLDP.

Run the following command to disable LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no lldp run	Disables LLDP.

Caution: Only lldp function is enabled can the system process lldp packets. Otherwise, lldp frame will be directly forwarded.

### 40.4.2 Configuring holdtime

In normal condition, the remote information stored in MIB will update before aging. But the frame may loss in sending and causes the information ages. For avoiding this, you need to set the value of TTL and ensure the update LLDP frame is forwarded time after time. You can control the timeout time of transmitting the LLDP message through modifying holdtime:

Run the following commands in global configuration mode to configure holdtime of LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp holdtime time	Configures the timeout time of LLDP. The value range from 0 to 65535. The default value is 120s.

Resumes the timeout time to the default value:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no lldp holdtime	Resumes the timeout time to the default value, 120 seconds.

Caution: To ensure the former neighbor information is not lost owing to aging when receiving next LLDP frame, the timeout time should be longer than the LLDP packet transmit interval.

### 40.4.3 Configuring Timer

You can control the interval of the switch to transmit message by configuring the timer of LLDP.

Run the following commands in global configuration mode to configure timer of LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp timer time	Configures the interval of message transmission of LLDP. The value ranges from 5 to 65534. The default time is 30 seconds.

Resumes the default interval, that is, 30 seconds.

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no lldp timer	Resumes the default interval, that is, 30 seconds.

### 40.4.4 Configuring Reinit

LLDP information will be forwarded automatically in two conditions: first, the status or value of one or more information elements (management objects) change; second, the sending timer timeouts. A single information change cause the LLDP packet is forwarded and a series of information change may cause many LLDP frames forwarded, but a frame can only report one change. For avoiding this, the web management defines the interval of two continuous LLDP frames. You can control the interval of the switch to continuously transmit two messages by configuring reinit of LLDP.

Run the following commands in global configuration mode to configure reinit of LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp reinit time	Configures the interval of LLDP to continuously

		transmit message. The value ranges from 2 to 5. The default time is 2 seconds.
--	--	--

Resumes the default value of reinit.

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no lldp reinit	Resumes the default interval of continuously transmitting message; the default interval value is two seconds.

## 40.4.5 Configuring the To-Be-Sent TLV

You can choose TLV which requires to be sent by configuring tlv-select of LLDP. By default, all TLVs are transmitted.

Run the following commands in global configuration mode to add or delete tlv of LLDP:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp tlv-select management-address	This step is optional. Transmits the management address tlv. The management address is usually Layer 3 IP address which should be easy to use.
Step 3	lldp tlv-select port-description	This step is optional. Transmits the port description tlv. The port description uses number or letters for description.
Step 4	lldp tlv-select system-capabilities	This step is optional. Transmits the system performance tlv. The system performance refers to the system of transmitting packets such as the switch or router.
Step 5	lldp tlv-select system-description	This step is optional. Transmits system description tlv. The system description consists of texts including numbers and letters. The system description should include the full name of the system, the hardware version, the software system and the network software.
Step 6	lldp tlv-select system-name	This step is optional. Transmits system name tlv. The system name domain is a specified name consisting of numbers and letters. The name of the system should be the name of the system manager. That is the name of the switch.

Run the following commands in global configuration mode to delete to-be-sent TLV:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no lldp tlv-select management-address	This step is optional. Transmits the management address tlv. The management address is usually Layer 3 IP address which should be easy to use.
Step 3	no lldp tlv-select port-description	This step is optional. Transmits the port

		description tlv. The port description uses number or letters for description.
Step4	no lldp tlv-select system-capabilities	This step is optional. Transmits the system performance tlv. The system performance refers to the system of transmitting packets such as the switch or router.
Step 5	no lldp tlv-select system-description	This step is optional. Transmits system description tlv. The system description consists of texts including numbers and letters. The system description should include the full name of the system, the hardware version, the software system and the network software.
Step 6	no lldp tlv-select system-name	This step is optional. Transmits system name tlv. The system name domain is a specified name consisting of numbers and letters. The name of the system should be the name of the system manager. That is the name of the switch.

## 40.4.6 Specifying the Port's Configuration and Selecting the To-Be-Sent Expanded TLV

Through the configuration of dot1-tlv-select/ dot3-tlv-select/ med-tlv-select of LLDP on a port, you can select expanded TLV to be sent. By default, TLV of both DOT1 and DOT3 will be transmitted while TLV of MED will not be transmitted.

Run the following commands in port configuration mode to add the to-be-sent TLV:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	lldp dot1-tlv-select port-vlan-id	(Optional) Sends the 802.1-defined TLV and notifies the PVID of a port.
Step 4	lldp dot1-tlv-select protocol-vlan-id	(Optional) Sends the 802.1-defined TLV and notifies the PPVID of a port.
Step 5	lldp dot1-tlv-select vlan-name	(Optional) Sends the 802.1-defined TLV and notifies the VLAN name of a port.
Step 6	lldp dot3-tlv-select macphy-config	(Optional) Sends the 802.3-defined TLV. The following contents are contained: a) The bit rate and the communication mode (duplex) on the physical layer; b) Current duplex and the set bit rate; c) Showing whether the setting is the results of auto-negotiation in the initial connection phase or is a compulsory manual behavior;
Step 7	lldp dot3-tlv-select power	(Optional) Sends the 802.3-defined TLV and shows the interface allows the power supply connecting to the non-power system through the link.
Step 8	lldp dot3-tlv-select link-aggregation	(Optional) Sends the 802.3-defined TLV and specifies a port to identify the aggregation if the link can be aggregated.

Step 9	lldp dot3-tlv-select max-frame-size	(Optional) Sends the 802.3-defined TLV and specifies the size of the maximum frame on a port(byte) .
Step10	lldp med-tlv-select network-policy	(Optional) Sends the MED-defined TLV and the interface can effectively discover and diagnose VLAN configured error-matching flow and the attribute of Layer 2 and Layer 3
Step 11	lldp med-tlv-select location	(Optional) Sends the MED-defined TLV and specifies the address. a) coordinate-based LCI, which is defined in IETF 3825[6]; b) city's address LCI, which is defined in IETF (refer to Annex B); c) ELIN code of the urgency call service;
Step 12	lldp med-tlv-select power-management	(Optional) Sends the MED-defined TLV and shows the information of power supply.
Step 13	lldp med-tlv-select inventory	(Optional) Sends the MED-defined TLV and shows the attribute of detailed inventory.

Run the following commands in global configuration mode to delete to-be-sent TLV:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	no lldp dot1-tlv-select port-vlan-id	(Optional) Sends the 802.1-defined TLV and notifies the PVID of a port.
Step 4	no lldp dot1-tlv-select protocol-vlan-id	(Optional) Sends the 802.1-defined TLV and notifies the PPVID of a port.
Step 5	no lldp dot1-tlv-select vlan-name	(Optional) Sends the 802.1-defined TLV and notifies the VLAN name of a port.
Step 6	no lldp dot3-tlv-select macphy-confg	(Optional) Sends the 802.3-defined TLV. The following contents are contained: a) The bit rate and the communication mode (duplex) on the physical layer; b) Current duplex and the set bit rate; c) Showing whether the setting is the results of auto-negotiation in the initial connection phase or is a compulsory manual behavior;
Step 7	no lldp dot3-tlv-select power	(Optional) Sends the 802.3-defined TLV and shows the interface allows the power supply connecting to the non-power system through the link.
Step 8	no lldp dot3-tlv-select link-aggregation	(Optional) Sends the 802.3-defined TLV and specifies a port to identify the aggregation if the link can be aggregated.
Step 9	no lldp dot3-tlv-select max-frame-size	(Optional) Sends the 802.3-defined TLV and specifies the size of the maximum frame on a port(byte) .
Step 10	no lldp med-tlv-select network-policy	(Optional) Sends the MED-defined TLV and the interface can effectively discover and diagnose VLAN configured error-matching flow and the attribute of layer-2 and layer-3.
Step 11	no lldp med-tlv-select location	(Optional) Sends the MED-defined TLV and

		specifies the address. a) coordinate-based LCI, which is defined in IETF 3825[6]; b) city's address LCI, which is defined in IETF (refer to Annex B); c) ELIN code of the urgency call service;
Step 12	no lldp med-tlv-select power-management	(Optional) Sends the MED-defined TLV and shows the information of power supply.
Step 13	no lldp med-tlv-select inventory	(Optional) Sends the MED-defined TLV and shows the attribute of detailed inventory.

## 40.4.7 Configuring the Transmission or Reception Mode

LLDP can work under three modes: transmit-only, receive-only and transmit-and-receive. By default, LLDP works under the transmit-and-receive mode. You can modify the working mode of LLDP through the following commands.

Run the following commands in the interface configuration mode and set lldp to the transmit-and-receive mode.

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	no lldp transmit	Disables the transmit-only mode of the port.
Step 4	no lldp receive	Disables the receive-only mode of the port.

Run the following commands in the interface configuration mode and set lldp to the transmit-and-receive mode.

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	lldp transmit	Enables the transmit mode of the port.
Step 4	lldp receive	Enables the receive mode of the port.

Note: Besides the above mode, the interface can also be configured to the transmit-only mode or the receive-only mode.

## 40.4.8 Specifying the Management IP Address of a Port

In port configuration state, you can randomly configure the management address of the port, from which the LLDP packets are transmitted. This management address should be an IP address related with this port, and only in this way the normal communication of this port can be guaranteed.

Run the following commands in port configuration mode to set the management IP address:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.

Step 3	lldp management-ip A.B.C.D	Sets the management IP address of a port.
--------	----------------------------	---

Note: Both the no lldp command and the management-ip command can be used to resume the default management address of the port and the default management address is the IP address of the VLAN interface that corresponds to the PVID port. When the corresponding VLAN interface does not exist, the management address is 0.0.0.0.

## 40.4.9 Sending Trap Notification to mib Database

Sending Trap Notification to lldp mib database or ptopo mib database.

Run the following commands in the global configuration mode to send trap notification to lldp mib database or ptopo mib database.

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	lldp trap-send lldp-mib	Sends trap notification to lldp mib database.
Step 3	lldp trap-send ptopo-mib	Sends trap notification to ptopo mib database.

Note: Both the no lldp command and the management-ip command can be used to resume the default management address of the port and the default management address is the IP address of the VLAN interface that corresponds to the PVID port. When the corresponding VLAN interface does not exist, the management address is 0.0.0.0.

## 40.4.10 Configuring the Location Information

The location configuration is used to determine the address of the local machine.

Run the following commands in global configuration mode to configure the location information:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	location elin identifier id WORD	Sets the location elin information, in which id is the elin identifier number and WORD stands for the elin information, which ranges from 10 to 25 bytes.
Step 3	location civic identifier id	Enters the location configuration mode.
Step 4	language WORD	Sets the language.
Step 5	state WORD	Sets the state's (provincial) name, such as shanghai.
Step 6	county WORD	Sets the name of a county.
Step 7	city WORD	Sets the name of a city.
Step 8	division WORD	Sets the name of a division.
Step 9	neighborhood WORD	Sets the name of neighborhood.
Step 10	street WORD	Sets the name of a street.
Step 11	leading-street-dir WORD	Sets the direction of a main street, such as N (north).
Step 12	trailing-street-suffix WORD	Sets the suffix of a small street, such as SW.
Step 13	street-suffix WORD	Sets the suffix of a street, such as platz.

Step 14	number WORD	Sets the street number, such as number 123.
Step 15	street-number-suffix WORD	Sets the suffix of the street number, such as number 1/2 of A road.
Step 16	landmark WORD	Sets the landmark, such as Colombia University.
Step 17	additional-location WORD	Sets the additional location.
Step 18	name WORD	Sets the information about a resident, such as Joe's haircut shop.
Step 19	postal-code WORD	Sets the postal code.
Step 20	building WORD	Sets the information about a building.
Step 21	unit WORD	Sets the information about a unit.
Step 22	floor WORD	Sets the information about a floor.
Step 23	room WORD	Sets the information about a room.
Step 24	type-of-place WORD	Sets the type of a place, such as office.
Step 25	postal-community WORD	Sets the name of a postal office.
Step 26	post-office-box WORD	Sets the name of a postal box, such as 12345.
Step 27	additional-code WORD	Sets the additional code.
Step 28	country WORD	Sets the name of a country.
Step 29	script WORD	Sets the script.

Run the following commands in global configuration mode to delete the location information:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	no location elin identifier id	Deletes the location elin information of elin identifier.
Step 3	no location civic identifier id	Deletes the location elin information of id, which is the number of civic identifier.
Step 4	location civic identifier id	Enters the location configuration mode.
Step 5	no language	Deletes the language.
Step 6	no state	Deletes the state's (provincial) name, such as shanghai.
Step 7	no county	Deletes the name of a county.
Step 8	no city	Deletes the name of a city.
Step 9	no division	Deletes the name of a division.
Step 10	no neighborhood	Deletes the name of neighborhood.
Step 11	no street	Deletes the name of a street.
Step 12	no leading-street-dir	Deletes the direction of a main street, such as N (north).
Step 13	no trailing-street-suffix	Deletes the suffix of a small street, such as SW.
Step 14	no street-suffix	Deletes the suffix of a street, such as platz.
Step 15	no number	Deletes the street number, such as number 123.
Step 16	no street-number-suffix	Deletes the suffix of the street number, such as number 1/2 of A road.

Step 17	no landmark	Deletes the landmark, such as Colombia University.
Step 18	no additional-location	Deletes the additional location.
Step 19	no name	Deletes the information about a resident, such as Joe's haircut shop.
Step 20	no postal-code	Deletes the name of a postal office.
Step 21	no building	Deletes the information about a building.
Step 22	no unit	Deletes the information about a unit.
Step 23	no floor	Deletes the information about a floor.
Step 24	no room	Deletes the information about a room.
Step 25	no type-of-place	Deletes the type of a place, such as office.
Step 26	no postal-community	Deletes the name of a postal office.
Step 27	no post-office-box	Deletes the name of a postal box, such as 12345.
Step 28	no additional-code	Deletes the additional code.
Step 29	no country	Deletes the name of a country.
Step 30	no script	Deletes the script.

## 40.4.11 Specifying a Port to Set the Location Information

The following commands can be used to set the location information for a port and bear the location information in TLV.

Run the following commands in port configuration mode to set the location information:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	location civic id	Sets the location information of civic id.
Step 4	location elin id	Sets the location information of elin id.

Run the following commands in port configuration mode to delete the location information:

Procedure	Command	Purpose
Step 1	config	Enters the global configuration mode.
Step 2	interface intf-type intf-id	Enters the interface configuration mode.
Step 3	no location civic	Deletes the location information of civic id.
Step 4	no location elin	Deletes the location information of elin id.

## 40.4.12 Configuring Show-Relative Commands

You can observe the information about the neighbor, statistics or port state received by the LLDP module by running show-relative commands..

Run the following commands in EXEC or global configuration mode:

Command	Purpose
Show lldp errors	Displays the error information about the LLDP module.
Show lldp interface interface-name	Displays the information about port state, that is, the transmission mode and the reception mode.
Show lldp neighbors	Displays the abstract information about the neighbor.
Show lldp neighbors detail	Displays the detailed information about the neighbor.
Show lldp traffic	Displays all received and transmitted statistics information.
Show location elin	Displays the information of location elin.
Show location civic	Displays the information of location civic.

### 40.4.13 Configuring the Delete Commands

You can delete the received neighbor lists and all statistics information by running the following commands.

Run the following commands in EXEC mode:

Command	Purpose
clear lldp counters	Deletes all statistics data.
clear lldp table	Deletes all received neighbor information.

## 40.5 Configuration Example

### 40.5.1 Network Environment Requirements

Configure LLDP protocol on the port connecting two switches.

### 40.5.2 Network Topology

Figure 2 Network Topology

### 40.5.3 Configuration Procedure

## ● Basic Settings

Configuring switch S1:

```
Switch_config#lldp run
```

```
Switch_config#
```

Configuring switch S2:

```
Switch_config#lldp run
```

```
Switch_config#
```

The information of Neighbor B will be displayed on Switch A about 1 minute later. MED-TLV information is not sent by default.

S1:

```
Switch_config#show lldp neighbors
```

Capability Codes:

(R)Router,(B)Bridge,(C)DOCSIS Cable Device,(T)Telephone

(W)WLAN Access Point, (P)Repeater,(S)Station,(O)Other

Device-ID	Local-Intf	Hldtme	Port-ID	Capability
Switch	Gig0/8	99	Gig0/1	B

# Chapter 41 Introduction of Fast Ethernet Ring Protection

## 41.1 Overview

Ethernet ring protection protocol is a special type of link-layer protocol specially designed for constructing the ring Ethernet topology. The Ethernet protection protocol can shut down one link in a complete ring topology, preventing the data loop from forming the broadcast storm. If a link is broken, the protocol immediately resumes the link that is previously shut down. In this way, the nodes among the ring network can communicate with each other.

The ring protection protocol and STP are both used for topology control on the link layer. STP is suitable for all kinds of complicated networks, which transmits the change of network topology hop by hop. The ring protection protocol is used for ring topology and adopts the pervasion mechanism to transmit the change of network topology. Therefore, the convergence of the ring protection protocol in the ring network is better than STP. In a sound network, the ring protection protocol can resume network communication within less than 50ms.

---

Remarks:

EAPS supports setting a switch to be a node of multiple physical rings so as to be able to construct a complicated topology.

---

## 41.2 Related Concepts of Fast Ether-Ring Protection

Figure 1.1 EAPS Ethernet ring

### 41.2.1 Roles of Ring's Nodes

Each switch on an Ethernet ring is a ring node. The ring nodes are classified into master nodes and transit nodes. Only one switch on the Ethernet ring can serve as a mere master node and other switches are worked as transit nodes.

Master node: It positively knows whether the ring's topology is complete, removes loopback, and controls other switches to update topology information.

Transit node: It only checks the state of the local port of the ring, and notifies the master node of the invalid link.

The role of each node can be specified by user through configuration. The thing is that each switch in the same ring can be set to only one kind of node. In figure 1.1, switch S1 is the master node of ring network, while switches S2, S3 and S4 are transit nodes.

### 41.2.2 Role of the Ring's Port

EAPS demands each switch has two ports to connect the ring network. Each port of the ring network also needs to be specified through configuration and the protocol supports the following kinds of port roles:

Primary port: the primary port can be configured only on the master node. The master node transmits the ring detection packets through the primary port.

Secondary port: the secondary port can be configured only on the master node. The master node receives the ring detection packets from the secondary port and judges whether the topology of the ring network is complete. In complete topology, the master node blocks the data packets on the secondary port, and prevents loopback from occurring; after a link on the ring network is interrupted, the master node will open the secondary port to forward the data packets.

Transit port: the transmit port can only be configured on the transit node. Both ports through which the transit node connects the ring network are all transit ports.

Each port of the ring network can be configured as only one port role after the node's role of the switch and the control VLAN are configured. As shown in figure 1.1, the port through which master node S1 connects transit node S4 is a primary port, the port through which S1 connects S2 is a secondary port, and the ports through which other switches connect the ring network are all transit ports.

---

Remarks:

To configure the same switch to multiple rings, the switch must connect different rings through different physical ports.

---

### 41.2.3 Control VLAN and Data VLAN

A private control VLAN is used between master node and transit node to transmit protocol packets. This control VLAN is specified by user through configuration and ring's ports are added also by user to the control VLAN, which guarantees that the protocol packets can be normally forwarded. In general, each port of the ring network is in the forwarding state in the control VLAN and the ports which do not belong to the ring network cannot forward the packets of control VLAN.

---

Note:

You can specify different control VLANs for each ring on a switch. The control VLAN is only used to forward the control packets of the ring network, not for L2/L3 communication. For example, if the VLAN port that corresponds to the control VLAN is established, the IP address of the VLAN port cannot be pinged through other devices.

---

The VLANs except the control VLAN are all data VLANs, which are used to transmit the packets of normal services or the management packets.

---

Note:

The data VLAN can be used for normal L2/L3 communication. For example, you can establish a VLAN port corresponding to data VLAN and configure dynamic routing protocols.

---

## 41.2.4 Aging of the MAC Address Table

The Ethernet ring protection protocol can transmit data packets to the correct link by controlling the aging of the switch's MAC address table when the topology changes. In general, the time for a MAC address to age in the MAC address table is 300 seconds. The ring protection protocol can control the aging of the MAC address table in a short time.

## 41.2.5 Symbol of a Complete Ring Network

Both the master node and the transit node can show whether the current ring network is complete through the state symbol "COMPLETE". On the master node, only when all links of the ring network are normal, the primary port is in the forwarding state and the secondary port is in blocking state showing the "COMPLETE" symbol; on the transit node, its two transit ports are in the forwarding state showing the "COMPLETE" symbol. The state symbol of the ring network helps user to judge the topology state of the current network.

## 41.3 Types of EAPS Packets

The EAPS packets can be classified into the following types, as shown in table 1.1.

Table 1.1 Types of EAPS packets

Type of the packet	Remarks
Loopback detection (HEALTH)	It is transmitted by the master node to detect whether the topology of the ring network is complete.
LINK-DOWN	Indicates that link interruption happens in the ring. This kind of packet is transmitted by the transit node.
RING-DOWN-FLUSH-FDB	It is transmitted by the master node after interruption of the ring network is detected and the packets show the MAC address aging table of the transit node.
RING-UP-FLUSH-FDB	It is transmitted by the master node after interruption of the ring network is resumed and the packets show the MAC address aging table of the transit node.

## 41.4 Fast Ethernet Ring Protection Mechanism

### 41.4.1 Ring Detection and Control of Master Node

The master node transmits the HEALTH packets to the control VLAN through the primary port in a configurable period. In normal case, the HEALTH packets will pass through all other nodes of the ring network and finally arrive at the secondary port of the master node.

The secondary port blocks all data VLANs in primitive condition. When receiving the HEALTH packets continuously, the secondary port keeps blocking data VLANs and blocking the loop. If the secondary port does not receive the HEALTH packets from the primary port at a certain time (which can be configured), it will regard

the ring network is not effective. Then the master node removes the blocking of data VLANs on the secondary port, ages the local MAC address table, and transmits the RING-DOWN-FLUSH-FDB packets to notify other nodes.

If the master node receives the HEALTH packets at the secondary port that is open to data VLANs, the ring network is resumed. In this case, the master node immediately blocks data VLANs on the secondary port, updates the local topology information and reports other nodes to age the MAC address table through RING-UP-FLUSH-FDB packets.

You can configure related commands on the Hello-time node and the Fail-time node to modify the interval for the primary port to transmit the HEALTH packets and the time limit for the secondary port to wait for the HEALTH packets.

### **41.4.2 Notification of Invalid Link of Transit Node**

After the transit port of the transit node is not effective, the LINK-DOWN packet will be immediately transmitted by the other transit port to notify other nodes. In normal case, the packet passes through other transit nodes and finally arrives at one port of the master node.

After the master node receives the LINK-DOWN packet, it thinks that the ring network is invalid. In this case, the master node removes the blocking of data VLANs on its secondary port, ages the local MAC address table, transmits the RING-DOWN-FLUSH-FDB packet and notifies other nodes.

### **41.4.3 Resuming the Link of the Transit Node**

After the transit port is resumed, it does not immediately transmit the packets of data VLANs, but enters the Pre-Forwarding state. A transit port in the pre-forwarding state only transmits and receives the control packets from the control VLAN.

If there is only one transit port invalid in the ring network and when the port enters the pre-forwarding state, the secondary port of the master node can receive the HEALTH packet from the primary port again. In this case, the master node blocks data VLANs on the secondary port again and transmits the notification of ageing address table outside. After the node with a transit port in pre-forwarding state receives the notification of aging address table, the node will first modify the pre-forwarding port to the forwarding port and then ages the local MAC address table.

If a transit mode does not receive the notification of aging address table from the master node, it thinks that the link to the master node is already out of effect. The transit node will automatically set the pre-forwarding port to be a forwarding one.

You can configure the related commands through the pre-forward-time node to modify the time for the transit port to keep the pre-forwarding state.

## **41.5 Fast Ethernet Ring Protection Configuration**

### **41.6 Default EAPS Settings**

---

Note:

The fast Ethernet protection protocol cannot be set together with STP.

---

After STP is disabled, you are recommended to run **spanning-tree bpduterminal** to keep the ring node from forwarding BPDU, which leads to the storm.

See the following table:

**Table 2.1 Default settings of the Ethernet ring protection protocol and STP.**

Spanning tree protocol	<b>spanning-tree mode rstp</b>
Fast Ethernet Ring Protection	There is no configuration.

## 41.7 Requisites Before Configuration

Before configuring MEAPS, please read the following items carefully:

- (4) One of important functions of the ring protection protocol is to stop the broadcast storm, so please make sure that before the ring link is reconnected all ring nodes are configured. If the ring network is connected in such that the configuration is not finished, the broadcast storm may easily occur.
- (5) [EAPS is well compatible with STP, but the port under the control of EAPS is not subject to STP.](#)
- (6) The ring protection protocol supports a switch to configure multiple ring networks.
- (7) [Configuring ring control VLAN will lead to the automatic establishment of corresponding system VLAN.](#)
- (8) The port of each ring can forward the packets from the control VLAN of the ring, while other ports, even in the Trunk mode, cannot forward the packets from the control VLAN.
- (9) By default, Fail-time of the master node is triple longer than Hello-time, so that packet delay is avoided from shocking the ring protection protocol. After Hello-time is modified, Fail-time need be modified accordingly.
- (10) By default, Pre-Forward-Time of the transit node is triple longer than Hello-time of the master node so that it is ensured that the master node can detect the recovery of the ring network before the transit port enters the pre-forwarding state. If Hello-time configured on the master node is longer than Pre-Forward-Time of the transit node, loopback is easily generated and broadcast storm is then triggered.
- (11) The physical interface, the fast-Ethernet interface, the gigabit-Ethernet interface and the aggregation interface can all be set to be the ring's interfaces. If link aggregation, 802.1X or port security has been already configured on a physical interface, the physical interface cannot be set to be a ring's interface anymore.

## 41.8 MEAPS Configuration Tasks

- (12) Configuring the Master Node
- (13) Configuring the Transit Node
- (14) Configuring the Ring Port
- (15) Browsing the State of the Ring Protection Protocol

## 41.9 Fast Ethernet Ring Protection Configuration

### 41.9.1 Configuring the Master Node

Configure a switch to be the master node of a ring network according to the following steps:

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.

Switch_config# <b>ether-ring</b> <i>id</i>	Sets a node and enters the node configuration mode. id: Instance ID
Switch_config_ring# <b>control-vlan</b> <i>vlan-id</i>	Configures the control VLAN. Vlan-id: ID of the control VLAN
Switch_config_ring# <b>master-node</b>	Configures the node type to be a master node.
Switch_config_ring# <b>hello-time</b> <i>value</i>	This step is optional. Configures the cycle for the master node to transmit the HEALTH packets. Value: It is a time value ranging from 1 to 10 seconds and the default value is 1 second.
Switch_config_ring# <b>fail-time</b> <i>value</i>	This step is optional. Configures the time for the secondary port to wait for the HEALTH packets. Value: It is a time value ranging from 3 to 30 seconds and the default value is 3 second.
Switch_config_ring# <b>exit</b>	Saves the current settings and exits the node configuration mode.

**Remark:**

The **no ether-ring *id*** command is used to delete the node settings and port settings of the Ethernet ring.

## 41.9.2 Configuring the Transit Node

Configure a switch to be the transit node of a ring network according to the following steps:

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.
Switch_config# <b>ether-ring</b> <i>id</i>	Sets a node and enters the node configuration mode. id: Instance ID
Switch_config_ring# <b>control-vlan</b> <i>vlan-id</i>	Configures the control VLAN. Vlan-id: ID of the control VLAN
Switch_config_ring# <b>transit-node</b>	Configures the node type to be a transit node.
Switch_config_ring# <b>pre-forward-time</b> <i>value</i>	This step is optional. Configures the time of maintaining the pre-forward state on the transit port. Value: It is a time value ranging from 3 to 30 seconds and the default value is 3 second.
Switch_config_ring# <b>exit</b>	Saves the current settings and exits the node configuration mode.

## 41.9.3 Configuring the Ring Port

Configure a port of a switch to be the port of Ethernet ring according to the following steps:

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.
Switch_config# <b>interface</b> <i>intf-name</i>	Enters the interface configuration mode.

	intf-name: Stands for the name of an interface.
Switch_config_intf# <b>ether-ring id {primary-port   secondary-port   transit-port }</b>	Configures the type of the port of Ethernet ring. ID of the node of Ethernet ring
Switch_config_intf# <b>exit</b>	Exits from interface configuration mode.

Remark:

The **no ether-ring id primary-port { secondary-port | transit-port }** command can be used to cancel the port settings of Ethernet ring.

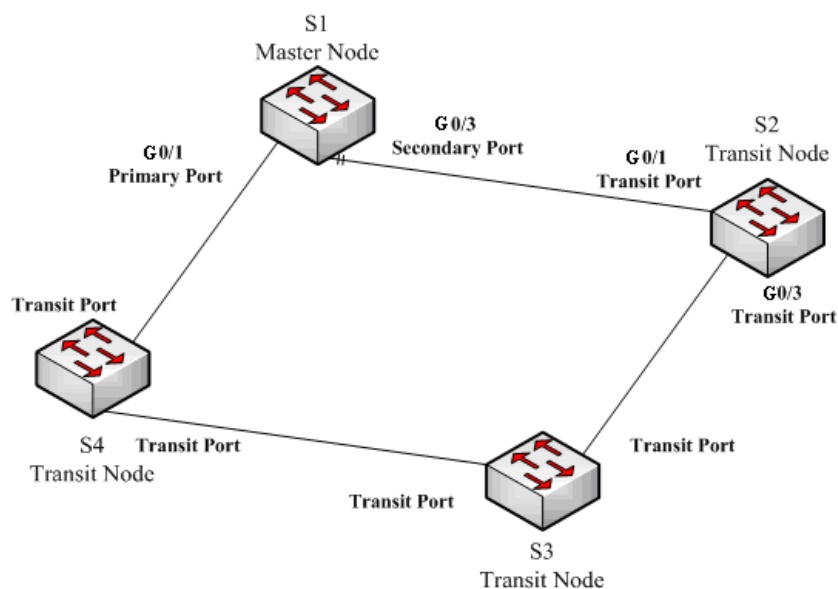

## 41.9.4 Browsing the State of the Ring Protection Protocol

Run the following commands to browse the state of the ring protection protocol:

Command	Purpose
<b>show ether-ring id</b>	Browses the summary information about the ring protection protocol and the port of Ethernet ring. id: ID of Ethernet ring
<b>show ether-ring id detail</b>	Browses the detailed information about the ring protection protocol and the port of Ethernet ring.
<b>show ether-ring id interface intf-name</b>	Browses the state of the Ether-ring port or that of the common port.

## 41.10 MEAPS Configuration

### 41.10.1 Configuration Example

MEAPS configuration

As shown in figure 2.1, master node S1 and transit node S2 are configured as follows. As to the settings of other nodes, they are the same as S2's settings.

#### Configuring switch S1:

Shuts down STP and configures the Ether-ring node:

```
S1_config#no spanning-tree
S1_config#ether-ring 1
S1_config_ring1#control-vlan 2
S1_config_ring1#master-node
```

The following commands are used to set the time related parameters:

```
S1_config_ring1#hello-time 2
S1_config_ring1#fail-time 6
```

Exits from the node configuration mode:

```
S1_config_ring1#exit
```

Configures the primary port and the secondary port:

```
S1_config#interface gigaEthernet 0/1
S1_config_g0/1#ether-ring 1 primary-port
S1_config_g0/1#exit
S1_config#interface gigaEthernet 0/3
S1_config_g0/3#ether-ring 1 secondary-port
S1_config_g0/3#exit
```

Establishes the control VLAN:

```
S1_config#vlan 2
S1_config_vlan2#exit
S1_config#interface range g0/1 , 3
S1_config_if_range#switchport mode trunk
S1_config_if_range#exit
```

### **Configuring switch S2:**

```
S1_config#no spanning-tree
S1_config#ether-ring 1
S1_config_ring1#control-vlan 2
S1_config_ring1#transit-node
S1_config_ring1#pre-forward-time 8
S1_config_ring1#exit
S1_config#interface gigaEthernet 0/1
S1_config_g0/1#ether-ring 1 transit-port
S1_config_g0/1#exit
S1_config#interface gigaEthernet 0/3
S1_config_g0/3#ether-ring 1 transit-port
S1_config_g0/3#exit
S1_config#vlan 2
S1_config_vlan2#exit
S1_config#interface range gigaEthernet 0/1 , 3
S1_config_if_range#switchport mode trunk
S1_config_if_range#exit
```

# Chapter 42 IGMP Snooping Configuration

## 42.1 IGMP Snooping Configuration Task

The task of IGMP snooping is to maintain the relationships between VLAN and group address and to update simultaneously with the multicast changes, enabling Layer 2 switches to forward data according to the topology structure of the multicast group.

The main functions of IGMP snooping are shown as follows:

- (4) Listening IGMP message;
- (5) Maintaining the relationship table between VLAN and group address;
- (6) Keeping the IGMP entity of host and the IGMP entity of router in the same state to prevent flooding from occurring.

Note:

Because IGMP snooping realizes the above functions by listening the **query** message and **report** message of IGMP, IGMP snooping can function properly only when it works on the multicast router, that is, the switch must periodically receive the IGMP **query** information from the router. The **router age** timer of IGMP snooping must be set to a time value that is bigger than the group query period of the multicast router connecting IGMP snooping. You can check the multicast router information in each VLAN by running **show ip igmp-snooping**.

- Enabling/Disabling IGMP snooping of VLAN
- Adding/Deleting static multicast address of VLAN
- Configuring immediate-leave of VLAN
- Configuring the function to filter multicast message without registered destination address
- Configuring the **Router Age** timer of IGMP snooping
- Configuring the **Response Time** timer of IGMP snooping
- Configuring IGMP Querier of IGMP snooping
- Monitoring and maintaining IGMP snooping
- IGMP snooping configuration example

### 42.1.1 Enabling/Disabling IGMP Snooping of VLAN

Perform the following configurations in global configuration mode:

Command	Description
<b>ip igmp-snooping</b> [vlan <i>vlan_id</i> ]	Enables IGMP-snooping of VLAN.
<b>no ip igmp-snooping</b> [vlan <i>vlan_id</i> ]	Resumes the default configuration.

If *vlan* is not specified, all vlans in the system, including vlans created later, can be enabled or disabled.

In the default configuration, IGMP snooping of all VLANs is enabled, just as the **ip igmp-snooping** command is configured.

**Note:** IGMP snooping can run on up to 16 VLANs.

To enable IGMP snooping on VLAN3, you must first run **no ip IGMP-snooping** to disable IGMP snooping of all VLANs, then configure **ip IGMP-snooping VLAN 3** and save configuration.

## 42.1.2 Adding/Deleting Static Multicast Address of VLAN

Hosts that do not support IGMP can receive corresponding multicast message by configuring the static multicast address.

Perform the following configurations in global configuration mode:

Command	Description
<b>ip igmp-snooping vlan <i>vlan_id</i> static A.B.C.D</b> <b>interface <i>intf</i></b>	Adds static multicast address of VLAN.
<b>no ip igmp-snooping vlan <i>vlan_id</i> static A.B.C.D</b> <b>interface <i>intf</i></b>	Deletes static multicast address of VLAN.

## 42.1.3 Configuring Immediate-leave of VLAN

When the characteristic immediate-leave is configured, the switch can delete the port from the port list of the multicast group after the switch receives the **leave** message. The switch, therefore, does not need to enable the timer to wait for other hosts to join the multicast. If other hosts in the same port belongs to the same group and their users do not want to leave the group, the multicast communication of these users may be affected. In this case, the **immediate-leave** function should not be enabled.

Perform the following configurations in global configuration mode:

Command	Description
<b>ip igmp-snooping vlan <i>vlan_id</i> immediate-leave</b>	Configures the <b>immediate-leave</b> function of the VLAN.
<b>no ip igmp-snooping vlan <i>vlan_id</i> immediate-leave</b>	Sets immediate-leave of VLAN to its default value.

The **immediate-leave** characteristic of VLAN is disabled by default.

## 42.1.4 Configuring Static Routing Interface of VLAN

Configure the static routing interface and send the multicast packet to the routing port. The switch will send the multicast report packets to all routing ports in vlan.

Run following commands in the global configuration mode:

Command	Purpose
<b>ip igmp-snooping vlan <i>vlan_id</i> mrouter interface <i>intf</i></b>	Add the static routing port of VLAN.
<b>no ip igmp-snooping vlan <i>vlan_id</i> mrouter interface <i>intf</i></b>	Delete the static routing port of VLAN.

## 42.1.5 Configuring IPACL of Generating Multicast Forward Table

Run the following commands to configure IPACL. Thus, The rules and limitations of generating the multicast forwarding table after receiving packets of igmp report can be set.

Command	Purpose
<b>ip igmp-snooping policy</b> <i>word</i>	Adds IPACL in generating multicast forwarding table.
<b>no ip igmp-snooping policy</b>	Deletes IPACL in generating multicast forwarding table.

### 42.1.6 Configuring the Function to Filter Multicast Message Without Registered Destination Address

When multicast message target fails to be found (DLF, the destination address is not registered in the switch chip through igmp-snooping), the default process method is to send message on all ports of VLAN. Through configuration, you can change the process method and all multicast messages whose destination addresses are not registered to any port will be dropped.

Command	Description
<b>ip igmp-snooping dlf-drop</b>	Drops multicast message whose destination fails to be found.
<b>no ip igmp-snooping dlf-drop</b>	Resumes the fault configuration (forward).

**Note:**

- (7) The attribute is configured for all VLANs.
- 1) The default method for the switch to handle this type of message is forward (message of this type will be broadcasted within VLAN).

### 42.1.7 Configuring Router Age Timer of IGMP Snooping

The **Router Age** timer is used to monitor whether the IGMP inquirer exists. IGMP inquirers maintain multicast addresses by sending **query** message. IGMP snooping works through communication between IGMP inquirer and host.

Perform the following configurations in global configuration mode:

Command	Description
<b>ip igmp-snooping timer router-age</b> <i>timer_value</i>	Configures the value of Router Age of IGMP-snooping.
<b>no ip igmp-snooping timer router-age</b>	Resumes the default value of Router Age of IGMP-snooping.

**Note:**

For how to configure the timer, refer to the query period setup of IGMP inquirer. The timer cannot be set to be smaller than query period. It is recommended that the timer is set to three times of the query period.

The default value of Router Age of IGMP snooping is 260 seconds.

### 42.1.8 Configuring Response Time of IGMP Snooping.

The **response time** is the upper limit time that the host reports the multicast after IGMP inquirer

sends the **query** message. If the **report** message is not received after the timer ages, the switch will delete the multicast address.

Perform the following configurations in global configuration mode:

Command	Description
<b>ip igmp-snooping timer response-time</b> <i>timer_value</i>	Configures the value of Response Time of IGMP-snooping.
<b>no ip igmp-snooping timer response-time</b>	Resumes the default value of Response Time of IGMP-snooping.

**Note:**

The timer value cannot be too small. Otherwise, the multicast communication will be unstable.

The value of Response Time of IGMP snooping is set to 15 seconds.

### 42.1.9 Configuring Querier of IGMP Snooping

If the multicast router does not exist in VLAN where IGMP snooping is activated, the **querier** function of IGMP snooping can be used to imitate the multicast router to regularly send IGMP **query** message. (The function is global, that is, it can be enabled or disabled in VLAN where IGMP snooping is globally enabled.)

When the multicast router does not exist in LAN and multicast flow does not need routing, the automatic query function of the switch can be activated through IGMP snooping, enabling IGMP snooping to work properly.

Perform the following configurations in global configuration mode:

Command	Description
<b>[no] ip igmp-snooping querier</b> <b>[address</b> <i>[ip_addr]</i>	Configures the querier of IGMP-snooping. The optional parameter <b>address</b> is the source IP address of <b>query</b> message.

The **IGMP-snooping querier** function is disabled by default. The source IP address of fake **query** message is 10.0.0.200 by default.

**Note:**

If the **querier** function is enabled, the function is disabled when the multicast router exists in VLAN; the function can be automatically activated when the multicast router times out.

### 42.1.10 Configuring IGMP Snooping's Querier Time

Querier Time is the time interval when switch as local IGMP querier sends messages. Timer broadcasts query message within VLAN after aging.

Configure the following in the global configuration mode:

Command	Operation
<b>ip igmp-snooping querier-timer</b> <i>timer_value</i>	Configures the value of IGMP snooping's Querier Time

<b>no ip igmp-snooping querier querier-timer</b>	Recovers IGMP snooping's Querier Time as default
--	--

By default IGMP snooping querier is shut down. The default time interval of Query messages is 200 seconds.

**Note:**

If Querier function is initiated, querier-timer should not be set as too long. In subnet if there are other switches with querier initiated, long querier-timer (longer than other switch's router-age) would lead to the instablization of querier selection in subnet.

### 42.1.11 Configuring Filter of IGMP Snooping

The command is used to enable IGMP snooping filter. The switch only enables the configured multicast group in the filter to add group.

Configure the following in the port configuration mode:

Command	Purpose
[no] ip igmp-snooping filter [address [ip_addr]	Configures filter of IGMP snooping; the optional parameter: address is the multicast group address.

By default the function "IGMP snooping filter" is disabled. All multicast addresses can add groups.

**Note:**

Only an arbitrary address that is configured can its filter function takes effect. Delete all addresses and the filter function is disabled.

### 42.1.12 Configuring Clear-group of IGMP Snooping

The command is used to delete all multicast groups recorded by igmp-snooping in the switch.

Configure as following under global configuration mode:

Command	Purpose
<b>ip igmp-snooping clear-group</b>	Delete all multicast groups manually

**Note:**

The command is used to delete all multicast groups in non-service condition.

### 42.1.13 Configuring quick-query of IGMP-snooping

If enable quick of IGMP-snooping, there is port up, send igmp query packets to the port directly.

Configure as following under global configuration mode:

Command	Purpose
[no] ip igmp-snooping quick-query	Enables the command and if there is port up, send igmp query packets to port up.

**Note:**

If quick-query is enabled, send query to the new port when there is up of the port. The function is applicable to the downstream host of not actively sending join packets.

### 42.1.14 Configuring Decrease-query-report-for-mvc of IGMP Snooping

If decrease-query-report of IGMP-snooping is enabled, the command works after enabling mvc. The command is used to decrease igmp-snooping forwarding or protocol packets of the broadcast in mvc mode.

Configure the following in the global configuration mode:

Command	Purpose
[no] ip igmp-snooping decrease-query-report-for-mvc	Configures decrease-query-report-for-mvc of IGMP-snooping. Decrease the number of protocol packet in the mode of mvc after the command is enabled.

By default, igmp-snooping and mvc will collaboratively send igmp protocol packets, which will increase the number of packets.

Note: If the function is enabled, it is not applicable to the condition of igmp-snooping and mvc working collaboratively.

### 42.1.15 Configuring no-send-special-query of IGMP-snooping

If no-send-special-query of IGMP-snooping is enabled and querier is disabled, special query will not be forwarded after receiving leave packets.

Configure the following in global configuration mode:

Command	Purpose
[no] ip igmp-snooping no-send-special-query	Configure no-send-special-query of IGMP-snooping

By default, special-query packets will be forwarded only leave packets are received.

**Note:**

If Querier is enabled, the command will not take effect.

### 42.1.16 Configuring Forward-L3-to-Mrouter of IGMP Snooping to Forward the Data Packets to the Routing Port

If L3 multicast feature is initiated and igmp-snooping does not join messages to downstream port, only downstream vlan port can be learnt by multicast route. If forward-l3-to-mrouter function is initiated, all the downstream router ports can be learned. Data messages could be sent to multicast router port registered by PIM-SM message not broadcasting messages to all downstream physical port. The command is mainly used under the following conditions.

When L3 multicast is enabled in multiple switch cascading, the upstream devices can only learn the downstream vlan ports through the multicast routing protocol and there is no IGMP packet exchange between the upstream and downstream devices. Hence the snooping of the upstream devices cannot learn the specific physical ports that the downstream devices connect and the upstream devices will send the multicast packets to all physical ports in the local vlan. After this command is enabled, the upstream devices can forward the multicast packets to the physical ports that the downstream devices connect, preventing the multicast packets to be broadcast in the downstream vlan.

Run the following commands in global configuration mode.

Command	Purpose
<code>[no] ip igmp-snooping forward-l3-to-mrouter</code>	Sets the forward-l3-to-mrouter function of IGMP-snooping.

By default, the IGMP-snooping forward-l3-to-mrouter is disabled.

**Note:**

**This command can be used to send the data packets to the multicast routing port, but the switchchip can limit the source-data-port, so the data packets will not be sent to the port of source data, but to the downstream multicast routing port that is registered on PIM-SM.**

### 42.1.17 Configuring Sensitive mode and Value for IGMP Snooping

If IGMP snooping's sensitive mode is enabled, when port in trunk mode is shut down, set router-age time of mrouter at active status as sensitive value, and send out query message quickly.

Configure the following in the global configuration mode:

Command	Purpose
<code>[no] ip igmp-snooping sensitive [value [3-30] ]</code>	Configuring IGMP-snooping's sensitive and value could be router-age time of currently active mrouter.

By default IGMP snooping sensitive is disabled.

**Note:**

When it is sensitive mode, sensitive value is used to update router-age aiming at current one time period. Next time, route-age is recovered as configured time router-age time.

### 42.1.18 Configuring IGMP Snooping's v3-leave-check Function

If IGMP-snooping's v3-leave-check feature is enabled, send special query message after receiving v3's leave message. Otherwise, no operation is processed.

Configure the following in the global configuration mode:

Command	Purpose
<code>[no] ip igmp-</code>	Configuring IGMP-snooping's v3-leave-check. Send special

<b>snooping leave-check</b>	<b>v3-</b>	query message after receiving v3 leave message..
---------------------------------	------------	--

### 42.1.19 Configuring IGMP Snooping's forward-wrongiif-within-vlan Function

If IGMP-snooping's forward-wrongiif-within-vlan function is enabled, do L2 forwarding of the multicast data message received from wrong vlan interface port within source vlan. Forward messages to the group member ports in the vlan. Otherwise, drop messages.

Configure as following under global configuration mode:

Command	Purpose
<b>[no] ip igmp-snooping forward-wrongiif-within-vlan</b>	Configuring IGMP-snooping's forward-wrongiif-within-vlan and forwarding relative group member ports within the vlan

By default IGMP-snooping forward-wrongiif-within-vlan is enabled.

**Notice:**

Command ip igmp-snooping forward-wrongiif-within-vlan is only meaningful when L3 multicast is enabled.

### 42.1.20 Configuring IGMP-snooping's IPACL function at port

If IGMP-snooping's IPACL function at port is enabled, use IPACL at port to assign whether messages of some multicast IP address need to be dealt with or ignored.

Configure as following under physical port configuration mode:

Command	Purpose
<b>ip igmp-snooping policy word</b>	Adding multicast message's IPACL which need to be dealt with port.
<b>no ip igmp-snooping policy</b>	Deleteding multicast message's IPACL which need to be dealt with port.

### 42.1.21 Configuring maximum multicast IP address quantity function at IGMP-snooping's port

If configuring the maximum multicast IP address quantity at IGMP-snooping port, the quantity of applied groups at the port would be judged whether it is beyond the configured maximum quantity when IGMP-snooping generates forwarding entry. If it is beyond the maximum quantity, the port's entry would not be generated.

Configure as following under physical port configuration mode:

Command	Purpose
<b>[no] ip igmp-snooping limit [value [1-2048]]</b>	configuring the maximum multicast IP address quantity at IGMP-snooping port

By default the maximum quantity is 2048 at IGMP-snooping.

## 42.1.22 Monitoring and Maintaining IGMP-Snooping

Perform the following operations in management mode:

Command	Purpose
<b>show ip igmp-snooping</b>	Displays IGMP-snooping configuration information.
<b>show ip igmp-snooping timer</b>	Displays the clock information of IGMP-snooping.
<b>show ip igmp-snooping groups</b>	Displays information about the multicast group of IGMP-snooping.
<b>show ip igmp-snooping statistics</b>	Displays statistics information about IGMP-snooping.
<b>[ no ] debug ip igmp-snooping [ packet   timer   event   error ]</b>	Enables and disables packet/clock debug/event/mistake print switch of IGMP-snooping. If the debug switch is not specified, all debug switches will be enabled or disabled.

Display VLAN information about IGMP-snooping running:

```
switch # show ip igmp-snooping
Global IGMP snooping configuration:
-----
Globally enable      : Enabled
VLAN nodes          : 1,50,100,200,400,500
Dif-frames filtering : Disabled
Sensitive           : Disabled
Querier             : Enabled
Querier address     : 10.0.0.200
Querier interval    : 140 s
Router age          : 260 s
Response time       : 15 s

vlan_id  Immediate-leave  Ports  Router Ports
-----
1        Disabled     5-10   SWITCH(querier);
50       Disabled     1-4    SWITCH(querier);
100      Disabled     NULL   SWITCH(querier);G0/1(static);
200      Disabled     NULL   SWITCH(querier);
400      Disabled     NULL   SWITCH(querier);
500      Disabled     NULL   SWITCH(querier);
```

Display information about the multicast group of IGMP-snooping:

```
switch# show ip igmp-snooping groups
The total number of groups      2

Vlan Group      Type Port(s)
-----
1 226.1.1.1     IGMP G0/1      G0/3
1 225.1.1.16    IGMP G0/1      G0/3
```

Display IGMP-snooping timer:

```
switch#show ip igmp-snooping timers
vlan 1 router age : 251 Indicating the timeout time of the router age timer
vlan 1 multicast address 0100.5e00.0809 response time : 1 Indicating the period from when the
last multicast group query message is received to the current time; if no host on the port respond
when the timer times out, the port will be deleted..
```

Display IGMP-snooping statistics:

```
switch#show ip igmp-snooping statistics
vlan 1
-----
v1_packets:0      IGMP v1  packet number
v2_packets:6      IGMP v2  packet number
v3_packets:0      IGMP v3  packet number
general_query_packets:5  General query of the packet number
special_query_packets:0  Special query of the packet number
join_packets:6     Number of report packets
leave_packets:0    Number of Leave packets
send_query_packets:0  Rreserved statistics option
err_packets:0      Number of incorrect packets
```

Debug the message timer of IGMP-snooping:

```
switch#debug ip igmp-snooping packet
Jan  1 02:22:28 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:22:28 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
Jan  1 02:22:29 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:22:29 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
Jan  1 02:22:38 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:22:38 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
Jan  1 02:22:39 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:22:39 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
Jan  1 02:23:11 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:23:11 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
Jan  1 02:23:12 IGMP-snooping: Receive IGMPv3 report from F0/1, vlan 1:
Jan  1 02:23:12 IGMP-snooping: Flood packet from F0/1 to vlan 1 rc = 0.
```

Debug the message timer of IGMP-snooping:

```
switch#debug ip igmp-snooping timer
Jan  1 02:30:36 IGMP-snooping: Vlan 1 router on interface (null) expiry.
Jan  1 02:30:36 IGMP-snooping: Vlan 100 router on interface (null) expiry.
Jan  1 02:30:36 IGMP-snooping: Vlan 200 router on interface (null) expiry.
Jan  1 02:30:36 IGMP-snooping: Vlan 400 router on interface (null) expiry.
Jan  1 02:30:36 IGMP-snooping: Vlan 500 router on interface (null) expiry. Inquerying the
response timer expiry
```

## 42.1.23 IGMP-Snooping Configuration Example

Figure 1 shows network connection of the example.

#### Configuring Switch

- (3) Enable IGMP-snooping of VLAN 1 connecting Private Network A.  
Switch\_config#ip igmp-snooping vlan 1
- (4) Enable IGMP-snooping of VLAN 2 connecting Private Network B.  
Switch\_config#ip igmp-snooping vlan 2

# Chapter 43 IGMP Proxy Configuration

## 43.1 IGMP Proxy Configuration Tasks

The IGMP Proxy allows the VLAN where the multicast user is located to receive the multicast source from other VLANs. The IGMP Proxy runs on layer 2 independently without other multicast routing protocols. IGMP proxy will be transmitted by the IGMP packets of the proxied VLAN to the proxying VLAN and maintain the hardware forward table of the multicast user of the agent VLAN according to these IGMP packets. IGMP proxy divides different VLANs into two kinds: proxied VLANs and proxying VLANs. The downstream multicast VLANs can be set to the proxied VLANs, while the upstream multicast VLANs can be set to the proxying VLANs.

Although IGMP proxy is based on IGMP snooping, two are independent in application; IGMP Snooping will not be affected when IGMP proxy is enabled or disabled, while IGMP proxy can run only when IGMP Snooping is enabled.

IGMP proxy cannot be used unless the following conditions are met:

1. L3 switch
2. Avoiding to enable IP multicast routing at the same time
3. Preventing a vlan to act as downstream vlan and also upstream vlan

22. Enabling/Disabling IGMP-Proxy
23. Adding/deleting VLAN agent relationship
24. Adding/deleting static multicast source entries
25. Monitoring and Maintaining IGMP-Proxy
26. Setting the Example of IGMP Proxy

### 43.1.1 Enabling/Disabling IGMP-Proxy

Run the following commands in global configuration mode.

Command	Purpose
<b>ip igmp-proxy enable</b>	Enables IGMP proxy.
<b>no ip igmp-proxy enable</b>	Resumes the default settings.

Note: IGMP-proxy cannot be enabled after IP multicast-routing is enabled. The previously enabled IGMP proxy is automatically shut down if IP multicast routing is enabled. The shutdown of ip multicast-routing will not lead to the automatic enablement of IGMP proxy.

### 43.1.2 Adding/Deleting VLAN Agent Relationship

Run the following commands in global configuration mode.

Command	Purpose
---------	---------

<b>ip igmp-proxy agent-vlan</b> <i>avlan_map</i> <b>client-vlan</b> <b>map</b> <i>cvlan_map</i>	Adds the agent VLAN ( <i>avlan_map</i> ) to manage the represented vlan ( <i>cvlan_map</i> ).
<b>no ip igmp-proxy agent-vlan</b> <i>avlan_map</i> <b>client-vlan</b> <b>map</b> <i>cvlan_map</i>	Deletes the agent relationship.

**Note:**

1 · The represented VLAN cannot be configured before vlan is designated by *avlan\_map*; also, the agent VLAN cannot be configured before *cvlan\_map*.

2. The represented and agent VLANs must accept the control of IGMP Snooping.

### 43.1.3 Adding/Deleting Static Multicast Source Entries

Run the following commands in global configuration mode.

Command	Purpose
<b>ip igmp-proxy source</b> <i>multi_ip src_ip svlan</i> <i>vlan_id</i> <b>sport</b> <i>intf_name</i>	Adds entries of the static source multicast.
<b>no ip igmp-proxy source</b> <i>multi_ip src_ip svlan</i> <i>vlan_id</i> <b>sport</b> <i>intf_name</i>	Deletes entries of the static source multicast.

Note: The SVLAN mentioned here is the multicast source VLAN and the vlan ID of SVLAN cannot be that of represented VLAN.

### 43.1.4 Monitoring and Maintaining IGMP-Proxy

Run the following commands in EXEC mode:

Command	Operation
<b>show ip igmp-proxy</b>	Displays the information about IGMP proxy.
<b>show ip igmp-proxy mcache</b> [ <i>delete</i>   <i>nonsync</i>   <i>sync</i> ] [ <i>static</i> ]	Displays the forwarding cache of IGMP proxy.  delete: display those entries of which hardware caches are deleted but software caches do not time out.  nonsync: display those entries that have been processed but not yet synchronized to the hardware cache..  Sync: display those entries already in the hardware cache.  All entries are to be displayed if no filtration conditions are specified.  static: only display the entries of static multicast cache.
[ <b>no</b> ] <b>debug ip igmp-proxy</b> [ <i>error</i>   <i>event</i>   <i>packet</i> ]	Enables or disables the IGMP-proxy debug switch.

The following example shows how to display the forwarding caches of IGMP proxy:

```

Switch# show ip igmp-proxy mcache
Codes: '+' synchronization, '-' deleted, 'S' static
       '^' unsynchronization

Item 1: Group 225.1.1.2
       +(192.168.213.163, 2, G3/24)
       VLAN 3,4

```

### 43.1.5 IGMP Proxy Configuration Example

The network topology is shown in figure 1.

Switch configuration:

(15) Enable IGMP snooping and IGMP proxy.

```
Switch_config#ip igmp-snooping
```

```
Switch_config#ip igmp-proxy enable
```

(16) Add VLAN 2 as the agent VLAN of the represented VLAN 3.

```
Switch_config#ip igmp-proxy agent-vlan 2 client-vlan map 3
```

# Chapter 44 Chapter 1 DHCP Snooping Configuration

## 44.1 IGMP Snooping Configuration Tasks

DHCP Snooping is to prevent the fake DHCP server from providing the DHCP service by judging the DHCP packets, maintaining the binding relationship between MAC address and IP address. The L2 switch can conduct the DAI function and the IP source guard function according to the binding relationship between MAC address and IP address. The DHCP snooping is mainly to monitor the DHCP packets and dynamically maintain the MAC-IP binding list. The L2 switch filters the packets, which do not meet the MAC-IP binding relationship, to prevent the network attack from illegal users.

- Enabling/Disabling DHCP-Snooping
- Enabling DHCP-Snooping in a VLAN
- Enabling DHCP anti-attack in a VLAN.
- Setting an Interface to a DHCP-Trusting Interface
- Enabling/Disabling binding table fast update function
- Enabling DAI in a VLAN
- Setting an Interface to an ARP-Trusting Interface
- Enabling Source IP Address Monitoring in a VLAN
- Setting an Interface to the One Which is Trusted by IP Source Address Monitoring
- Setting DHCP-Snooping Option 82
- Setting the Policy of DHCP-Snooping Option82 Packets
- Setting the TFTP Server for Backing up Interface Binding
- Setting a File Name for Interface Binding Backup
- Setting the Interval for Checking Interface Binding Backup
- Setting Interface Binding Manually
- Monitoring and Maintaining DHCP-Snooping
- Example of DHCP-Snooping Configuration

### 44.1.1 Enabling/Disabling DHCP Snooping

Run the following commands in global configuration mode.

Command	Purpose
<b>ip dhcp-relay snooping</b>	Enables DHCP-snooping.
<b>no ip dhcp-relay snooping</b>	Resumes the default settings.

This command is used to enable DHCP snooping in global configuration mode. After this command is run, the switch is to monitor all DHCP packets and form the corresponding binding relationship.

Note: If the client obtains the address of a switch before this command is run, the switch cannot add the corresponding binding relationship.

## 44.1.2 Enabling DHCP Snooping in a VLAN

If DHCP snooping is enabled in a VLAN, the DHCP packets which are received from all distrusted physical ports in a VLAN will be legally checked. The DHCP response packets which are received from distrusted physical ports in a VLAN will then be dropped, preventing the faked or mis-configured DHCP server from providing address distribution services. For the DHCP request packet from distrusted ports, if the hardware address field in the DHCP request packet does not match the MAC address of this packet, the DHCP request packet is then thought as a fake packet which is used as the attack packet for DHCP DOS and then the switch will drop it.

Run the following commands in global configuration mode.

Command	Purpose
<b>ip dhcp-relay snooping vlan</b> <i>vlan_id</i>	Enables DHCP-snooping in a VLAN.
<b>no ip dhcp-relay snooping vlan</b> <i>vlan_id</i>	Disables DHCP-snooping in a VLAN.

## 44.1.3 Enabling DHCP Anti-attack in a VLAN.

To enable attack prevention in a VLAN, you need to configure the allowable maximum DHCP clients in a specific VLAN and conduct the principle of "first come and first serve". When the number of users in the specific VLAN reaches the maximum number, new clients are not allowed to be distributed.

Run the following commands in global configuration mode.

Command	Purpose
<b>ip dhcp-relay snooping vlan</b> <i>vlan_id</i> <b>max-client</b> <i>number</i>	Enabling DHCP anti-attack in a VLAN.
<b>no ip dhcp-relay snooping vlan</b> <i>vlan_id</i> <b>max-client</b>	Disables DHCP anti-attack in a VLAN.

## 44.1.4 Setting an Interface to a DHCP-Trusting Interface

If an interface is set to be a DHCP-trusting interface, the DHCP packets received from this interface will not be checked.

Run the following commands in physical interface configuration mode.

Command	Operation
<b>dhcp snooping trust</b>	Setting an Interface to a DHCP-Trusting Interface
<b>no dhcp snooping trust</b>	Resumes an interface to a DHCP-distrusted interface.

The interface is a distrusted interface by default

## 44.1.5 Enabling/Disabling Binding Table Fast Update Function

This function is disabled by default. When this function is disabled and a port has been bound to client A, the DHCP request of the same MAC address on other ports will be regarded as a fake MAC attack even if client A is off line.

When this function is enabled, the above-mentioned case will not occur.

It is recommended to use this function in case that a client frequently changes its port and address lease, distributed by DHCP server, cannot be modified to a short period of time.

Command	Operation
<b>ip dhcp-relay snooping rapid-refresh-bind</b>	Enables the fast update function of the binding table.
<b>no ip dhcp-relay snooping rapid-refresh-bind</b>	Disables the fast update function of the binding table.

## 44.1.6 Enabling DAI in a VLAN

When dynamic ARP monitoring is conducted in all physical ports of a VLAN, a received ARP packet will be rejected if the source MAC address and the source IP address of this packet do not match up with the configured MAC-IP binding relationship. The binding relationship on an interface can be dynamically bound by DHCP or configured manually. If no MAC addresses are bound to IP addresses on a physical interface, the switch rejects forwarding all ARP packets.

Command	Operation
<b>ip arp inspection vlan <i>vlanid</i></b>	Enables dynamic ARP monitoring on all distrusted ports in a VLAN.
<b>no ip arp inspection vlan <i>vlanid</i></b>	Disables dynamic ARP monitoring on all distrusted ports in a VLAN.

## 44.1.7 Setting an Interface to an ARP-Trusting Interface

ARP monitoring is not enabled on those trusted interfaces. The interfaces are distrusted ones by default.

Run the following commands in interface configuration mode.

Command	Operation
<b>arp inspection trust</b>	Setting an Interface to an ARP-Trusting Interface
<b>no arp inspection trust</b>	Resumes an interface to an ARP-distrusting interface.

## 44.1.8 Enabling Source IP Address Monitoring in a VLAN

After source IP address monitoring is enabled in a VLAN, IP packets received from all physical ports in the

VLAN will be rejected if their source MAC addresses and source IP addresses do not match up with the configured MAC-to-IP binding relationship. The binding relationship on an interface can be dynamically bound by DHCP or configured manually. If no MAC addresses are bound to IP addresses on a physical interface, the switch rejects forwarding all IP packets received from the physical interface.

Run the following commands in global configuration mode.

Command	Operation
<b>ip verify source vlan</b> <i>vlanid</i>	Enables source IP address checkup on all distrusted interfaces in a VLAN.
<b>no ip verify source vlan</b> <i>vlanid</i>	Disables source IP address checkup on all interfaces in a VLAN.

Note: If the DHCP packet (also the IP packet) is received, it will be forwarded because global snooping is configured.

### 44.1.9 Setting an Interface to the One Which is Trusted by IP Source Address Monitoring

The source address detection function will not be enabled for the IP source address trust interface.

Run the following commands in interface configuration mode.

Command	Operation
<b>ip-source trust</b>	Sets an interface to the one with a trusted source IP address.
<b>no ip-source trust</b>	Resumes an interface to the one with a distrusted source IP address.

### 44.1.10 Setting DHCP Snooping Option 82

Option 82 brings the local information to a server and helps the server to distribute addresses to clients.

Run the following commands in the global configuration mode.

Command	Operation
<b>ip dhcp-relay snooping information option</b>	Sets that option82, which is in the default format, is carried when DHCP-snooping forwards the DHCP packets.
<b>no ip dhcp-relay snooping information option</b>	Sets that option82 is not carried when DHCP-snooping forwards the DHCP packets.

To specify the format of option82, conduct the following settings in global mode.

Command	Operation
<b>ip dhcp-relay snooping information option format</b>	Sets the format of option82 that the DHCP packets carry when they are forwarded by DHCP-Snooping.

{snmp-ifindex/manual/hn-type / cm-type/ [host]}	
no ip dhcp-relay snooping information option format {snmp-ifindex/manual/hn-type /cm-type/[host]}	Sets that option82 is not carried when DHCP-snooping forwards the DHCP packets.

If a manual mode is set to enter in option82, conduct the following configurations in interface mode to set the circuit-id:

Command	Operation
dhcp snooping information circuit-id string [STRING]	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the character string written by STRING. This command is set on the port that connects the client.
dhcp snooping information circuit-id <b>hex</b> [xx-xx-xx-xx-xx-xx]	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the Hex system.. This command is set on the port that connects the client.
no dhcp snooping information circuit-id	Deletes the manually configured option82 circuit-id.

If a manual mode is set to enter in option82, conduct the following configurations in interface mode to set the remote-id:

Command	Operation
dhcp snooping information remote-id string [STRING]	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the character string written by STRING. This command is set on the port that connects the client.
dhcp snooping information remote-id <b>hex</b> [xx-xx-xx-xx-xx-xx]	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the Hex system.. This command is set on the port that connects the client.
no dhcp snooping information remote-id	Deletes the manually configured option82 remote-id.

If a manual mode is set to enter in option82, conduct the following configurations in interface mode to set the vendor-specific:

Command	Operation
<b>dhcp snooping information vendor-specific string STRING</b>	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the character string written by STRING. This command is set on the port that connects the client.
<b>dhcp snooping information vendor-specific hex [xx-xx-xx-xx-xx-xx]</b>	If option82 is set to be in the manual format, you need to set DHCP-snooping to forward DHCP packets with bearing of option82, whose content is the Hex system.. This command is set on the port that connects the client.
<b>no dhcp snooping information vendor-specific</b>	Deletes the manually configured option82 vendor-specific.

#### 44.1.11 Setting the Policy of DHCP Snooping Option82 Packets

You can set the policy for the DHCP request packets, which carry with option82, after these packets are received. The policies include the following ones:

“Drop” policy: Run the following commands in the port mode to drop the request packets with option82.

Command	Operation
<b>dhcp snooping information drop</b>	Drops the request packets that contain option82.

“Append” policy: Run the following command in port mode to add the request packets with option82.

Command	Operation
<b>dhcp snooping information append</b>	Enables the function to add option82 on a port.
<b>dhcp snooping information append first-subop9-param { hex xx-xx-xx-xx-xx-xx   vlanip   hostname }</b>	Stands for the first parameter carried by option82 vendor-specific (suboption9).
<b>dhcp snooping information append second-subop9-param { hex xx-xx-xx-xx-xx-xx   vlanip   hostname }</b>	Stands for the second parameter carried by option82 vendor-specific (suboption9).

#### 44.1.12 Setting the TFTP Server for Backing Up Interface Binding

After the switch configuration is rebooted, the previously-configured interface binding will be lost. In this case,

there is no binding relationship on this interface. After source IP address monitoring is enabled, the switch rejected forwarding all IP packets. After the TFTP server is configured for interface binding backup, the binding relationship will be backed up to the server through the TFTP protocol. After the switch is restarted, the switch automatically downloads the binding list from the TFTP server, securing the normal running of the network.

Run the following commands in global configuration mode.

Command	Operation
<code>ip dhcp-relay snooping database-agent <i>ip-address</i></code>	Configures the IP address of the TFTP server which is to back up interface binding.
<code>no ip dhcp-relay snooping database-agent <i>ip-address</i></code>	Cancels the TFTP Server for backing up interface binding.

#### 44.1.13 Setting a File Name for Interface Binding Backup

When backing up the interface binding relationship, the corresponding file name will be saved on the TFTP server. In this way, different switches can back up their own interface binding relationships to the same TFTP server.

Run the following commands in global configuration mode.

Command	Operation
<code>ip dhcp-relay snooping db-file <i>name</i> [timestamp]</code>	Configures a file name for interface binding backup.
<code>no ip dhcp-relay snooping db-file</code>	Cancels a file name for interface binding backup.

#### 44.1.14 Setting the Interval for Checking Interface Binding Backup

The MAC-to-IP binding relationship on an interface changes dynamically. Hence, you need check whether the binding relationship updates after a certain interval. If the binding relationship updates, it need be backed up again. The default time interval is 30mins.

Run the following commands in global configuration mode.

Command	Operation
<code>ip dhcp-relay snooping write-immediately</code>	Configures DHCP Snooping immediate backup when the binding information changes.  <code>no ip dhcp-relay snooping {write-time   write-immediately}</code> Resumes the interval of checking interface binding backup to the default settings.
<code>ip dhcp-relay snooping write-time <i>num</i></code>	Configures the interval for checking interface binding backup. The unit is min.

no ip dhcp-relay snooping write-time	Resumes the interval of checking interface binding backup to the default settings.
--------------------------------------	--

### 44.1.15 Setting Interface Binding Manually

If a host does not obtain the address through DHCP, you can add the binding item on an interface of a switch to enable the host to access the network. You can run no ip source binding MAC IP to delete items from the corresponding binding list.

Note that the manually-configured binding items have higher priority than the dynamically-configured binding items. If the manually-configured binding item and the dynamically-configured binding item have the same MAC address, the manually-configured one updates the dynamically-configured one. The interface binding item takes the MAC address as the unique index.

Run the following commands in global configuration mode.

Command	Operation
ip source binding <i>MAC IP</i> interface <i>name</i> [vlan <i>vlan-id</i> ]	Configures Interface Binding Manually
no ip source binding <i>MAC IP</i> vlan <i>vlan-id</i>	Cancels an interface binding item.

### 44.1.16 Monitoring and Maintaining DHCP-Snooping

Run the following commands in EXEC mode:

Command	Operation
<b>show ip dhcp-relay snooping</b>	Displays the information about DHCP-snooping configuration.
<b>show ip dhcp-relay snooping binding</b>	Displays the effective address binding items on an interface.
<b>show ip dhcp-relay snooping binding all</b>	Displays all binding items which are generated by DHCP snooping.
[ <b>no</b> ] <b>debug ip dhcp-relay</b> [ snooping   binding   event   all ]	Enables or disables the switch of DHCP relay snooping binding or event.

The following shows the information about the DHCP snooping configuration.

```
switch#show ip dhcp-relay snooping
 ip dhcp-relay snooping vlan 3
 ip arp inspection vlan 3
 DHCP Snooping trust interface:
   GigaEthernet0/1
 ARP Inspect interface:
```

GigaEthernet0/11

The following shows the binding information about dhcp-relay snooping:

```
switch#show ip dhcp-relay snooping binding
```

Hardware Address	IP Address	remainder time	Type	VLAN	interface
00-e0-0f-26-23-89	192.2.2.101	86400		DHCP_SN	3

GigaEthernet0/3

The following shows the binding information about dhcp-relay snooping:

```
switch#show ip dhcp-relay snooping binding all
```

Hardware Address	IP Address	remainder time	Type	VLAN	interface
00-e0-0f-32-1c-59	192.2.2.1	infinite		MANUAL	1
00-e0-0f-26-23-89	192.2.2.101	86400		DHCP_SN	3

GigaEthernet0/2  
GigaEthernet0/3

The following shows the information about dhcp-relay snooping.

```
switch#debug ip dhcp-relay all
```

```
DHCPR: receive I2 packet from vlan 3, diID: 3  
DHCPR: DHCP packet len 277  
DHCPR: add binding on interface GigaEthernet0/3  
DHCPR: send packet continue  
DHCPR: receive I2 packet from vlan 3, diID: 1  
DHCPR: DHCP packet len 300  
DHCPR: send packet continue  
DHCPR: receive I2 packet from vlan 3, diID: 3  
DHCPR: DHCP packet len 289  
DHCPR: send packet continue  
DHCPR: receive I2 packet from vlan 3, diID: 1  
DHCPR: DHCP packet len 300  
DHCPR: update binding on interface GigaEthernet0/3  
DHCPR: IP address: 192.2.2.101, lease time 86400 seconds  
DHCPR: send packet continue
```

## 44.1.17 Example of DHCP Snooping Configuration

The network topology is shown in figure 1.

### Configuring Switch

Enable DHCP snooping in VLAN 1 which connects private network A.

```
Switch_config#ip dhcp-relay snooping
```

```
Switch_config#ip dhcp-relay snooping vlan 1
```

Enable DHCP snooping in VLAN 2 which connects private network B.

```
Switch_config#ip dhcp-relay snooping
```

```
Switch_config#ip dhcp-relay snooping vlan 2
```

Sets the interface which connects the DHCP server to a DHCP-trusting interface.

```
Switch_config_g0/1#dhcp snooping trust
```

Configure option82 instance manually

```
interface GigaEthernet0/1
```

```
  dhcp snooping information circuit-id hex 00-01-00-05
```

```
  dhcp snooping information remote-id hex 00-e0-0f-13-1a-50
```

```
  dhcp snooping information vendor-specific hex 00-00-0c-f8-0d-01-0b-78-69-61-6f-6d-69-6e-37-31-31-34
```

```
  dhcp snooping information append
```

```
  dhcp snooping information append first-subop9-param hex 61-62-63-61-62-63
```

```
!
```

```
interface GigaEthernet0/2
```

```
  dhcp snooping trust
```

```
  arp inspection trust
```

```
  ip-source trust
```

```
!
```

```
!
```

```
!
```

```
ip dhcp-relay snooping
```

```
ip dhcp-relay snooping vlan 1-100
```

```
ip arp inspection vlan 1
```

ip verify source vlan 1

ip dhcp-relay snooping information option format manual

# Chapter 45 Configuring Layer 2 Protocol Tunnel

## 45.1 Introduction

Layer 2 protocol tunnel allows users between two sides of the switch to transmit the specified layer 2 protocol on their own network without being influenced by the relevant layer 2 software module of the switch. The switch is a transparent media for users.

## 45.2 Configuring Layer 2 Protocol Tunnel

Use the command line on the interface of the switch to configure tunnel function of the layer 2 protocol. The configuration steps are as follows:

Command	Description
<b>configure</b>	Enters global configuration mode.
<b>interface &lt;intf_name&gt;</b>	Enters interface configuration mode of the switch. Only the switch port supports layer 2 protocol tunnel (including physical port and aggregation port).
<b>[no] l2protocol-tunnel [stp]</b>	Enables layer 2 protocol of the tunnel function. Currently we only support tunnel function of stp protocol.
<b>[CTRL] + Z</b>	Returns to EXEC mode.
<b>write</b>	Saves configuration.

## 45.3 Configuration Example of Layer 2 Protocol Tunnel

Network environment is as follows :

A1/A2/Gather belong to core network, C1/C2 are switches distributed in two places. Customer wants to combine two of its network to one , that is, the core network is a transparent transmission channel for the customer. If user wants to realize the transparent transmission of STP, then the following configurations should be configured on each switch:

- (5) The f0/2 of Switch A1, f0/1 and f0/2 of Gather, f0/1 of A2 should be configured to trunk mode.

- (6) The f0/1 of switch A1, f0/2 of A2 should be configured to Access, and enables tunnel function of the STP protocol.

# Chapter 46 QoS Configuration

If you care to use your bandwidth and your network resources efficiently, you must pay attention to QoS configuration.

## 46.1 QoS Overview

### 46.1.1 QoS Concept

In general, the switch works in best-effort served mode in which the switch treats all flows equally and tries its best to deliver all flows. Thus if congestion occurs all flows have the same chance to be discarded. However in a real network different flows have different significances, and the QoS function of the switch can provide different services to different flows based on their own significances, in which the important flows will receive a better service.

As to classify the importance of flows, there are two main ways on the current network:

5. The tag in the 802.1Q frame header has two bytes and 3 bits are used to present the priority of the packet. There are 8 priorities, among which 0 means the lowest priority and 7 means the highest priority.
6. The DSCP field in IP header of the IP packet uses the bottom 6 bits in the TOS domain of the IP header.

In real network application the edge switch distributes different priorities to different flows based on their significance and then different services will be provided to different flows based on their priorities, which is the way to realize the terminal-to-terminal QoS.

Additionally, you can also configure a switch in a network, enabling the switch to process those packets with specific attributes (according to the MAC layer or the L3 information of packets) specially. This kind of behaviors are called as the one-leap behaviors.

The QoS function of the switch optimizes the usage of limited network bandwidth so that the entire performance of the network is greatly improved.

### 46.1.2 Terminal-To-Terminal QoS Model

The service model describes a group of terminal-to-terminal QoS abilities, that is, the abilities for a network to transmit specific network communication services from one terminal to another terminal. The QoS software supports two kinds of service models: Best-Effort service and Differentiated service.

## **Best-effort service**

The best-effort service is a singular service model. In this service model, an application can send any amount of data at any necessary time without application of permits or network notification. As to the best-effort service, if allowed, the network can transmit data without any guarantee of reliability, delay or throughput. The QoS of the switch on which the best-effort service is realized is in nature this kind of service, that is, first come and first served (FCFS).

## **Differentiated service**

As to the differentiated service, if a special service is to be transmitted in a network, each packet should be specified with a corresponding QoS tag. The switch uses this QoS rule to conduct classification and complete the intelligent queuing. The QoS of the switch provides Strict Priority (SP), Weighted Round Robin (WRR), Deficit Round Robin (DRR) and First-Come-First-Served (FCFS).

### **46.1.3 Queue Algorithm of QoS**

Each queue algorithm is the important basis to realize QoS. The QoS of the switch provides the following algorithms: Strict Priority (SP), Weighted Round Robin (WRR), Deficit Round Robin (DRR) and First-Come-First-Served (FCFS).

## **Strict priority**

This algorithm means to first provide service to the flow with the highest priority and after the highest-priority flow comes the service for the next-to-highest flow. This algorithm provides a comparatively good service to those flows with relatively high priority, but its shortage is also explicit that the flows with low priority cannot get service and wait to die.

## **Weighted round robin**

Weighted Round Robin (WRR) is an effective solution to the defect of Strict Priority (SP), in which the low-priority queues always die out. WRR is an algorithm that brings each priority queue a certain bandwidth and provides service to each priority queue according to the order from high priority to low priority. After the queue with highest priority has used up all its bandwidth, the system automatically provides service to those queues with next highest priority.

## Weighted Fair Queuing

Weighted Round Robin (WRR) is an effective solution to the defect of Strict Priority (SP), in which the low-priority queues always die out. WRR is an algorithm that brings each priority queue a certain bandwidth and provides service to each priority queue according to the order from high priority to low priority. After the queue with highest priority has used up all its bandwidth, the system automatically provides service to those queues with next highest priority.

## **First come first served**

The First-Come-First-Served queue algorithm, which is shortened as FCFS, provides service to those packets according to their sequence of arriving at a switch, and the packet that first arrives at the switch will be served first.

### **46.1.4 Weighted Random Early Detection**

## **Congestion avoidance and traditional packet loss mechanism**

Excessive congestion may inflict damage on network resources, so network congestion should be resolved through some measures. Congestion avoidance is a sort of flow control method of positively dropping packets and regulating network flows to solve network overload via network resource monitoring. The traditional way of resolving network congestion is to drop all incoming packets when the queue length reaches its threshold. But for TCP packets, heavy packet loss may cause TCP timeout and lead to slow TCP startup and congestion avoidance, which is called as TCP global synchronization.

## WRED

The WRED algorithm is adopted to prevent TCP global synchronization. WRED helps users to set the queue threshold. When the queue length is less than the configured threshold, the packets will not be dropped; otherwise, the packets will be dropped randomly. Because WRED drops packets randomly, it is avoided for multiple TCP connections to slow down the transmission speed at the same time, which is the reason why TCP global synchronization is avoided. WRED enables other TCP connections to maintain a relatively high transmission speed when the packets of a certain TCP connection begin to be dropped and their transmission speed is slowed down. No matter what time it is, there are always some TCP connections to transmit packets with a high speed, which ensures effective bandwidth usability.

WRED cooperation is conducted when packets enter the outgoing queue and are checked for their size and packets in different ranges get different treatments. The key parameters include **Start**, **Slop** and **Drop priority**.

- When the queue length is less than **start**, packets will not be dropped.
- When the queue length is bigger than **start**, the incoming packets begin to be dropped randomly. The longer the queue is, the higher the dropping rate is.
- The rate for packet loss rises along with the increase of the queue length.

## 46.2 QoS Configuration Task List

In general, ONU will try its best to deliver each packet and when congestion occurs all packets have the same chance to be discarded. However, in reality different packets have different importance and the comparatively important packets should get the comparatively good service. QoS is a mechanism to provide different priority services to packets with different importance, in which the network can have its better performance and be used efficiently.

This chapter presents how to set QoS on ONU.

The following are QoS configuration tasks:

7. Setting the Global CoS Priority Queue

8. [Setting Global Cos to Local Priority Mapping](#)
9. [Setting the Bandwidth of the CoS Priority Queue](#)
10. [Setting the Schedule Policy of the CoS Priority Queue](#)
11. [Setting the Default CoS Value of a Port](#)
12. [Setting the CoS Priority Queue of a Port](#)
13. [Setting the CoS Priority Queue of a Port](#)
14. [Establishing the QoS Policy Mapping](#)
15. [Setting the Description of the QoS Policy Mapping](#)
16. [Setting the Matchup Data Flow of the QoS Policy Mapping](#)
17. [Setting the Actions of the Matchup Data Flow of the QoS Policy Mapping](#)
18. Applying the QoS Policy on a Port
19. Configuring the Trust Mode
20. [Displaying the QoS Policy Mapping Table](#)

## 46.3 QoS Configuration Tasks

### 46.3.1 Setting the Global CoS Priority Queue

The task to set the QoS priority queue is to map 8 CoS values, which are defined by IEEE802.1p, to the priority queues in a switch. This series of switch has 8 priority queues. According to different queues, the switch will take different schedule policies to realize QoS.

If a CoS priority queue is set in global mode, the mapping of CoS priority queue on all ports will be affected. When priority queues are set on a L2 port, the priority queues can only work on this L2 port.

Enter the following privileged mode and run the following commands one by one to set DSCP mapping.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] cos map</b> <i>quid cos1..cosn</i>	Sets the CoS priority queue. <b>quid</b> stands for the ID of a CoS priority queue. <b>cos1...cosn</b> stands for the IEEE802.1p-defined CoS value.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

### 46.3.2 Setting Global Cos to Local Priority Mapping

The command is used to set map inner CoS priority to the congestion bit.

Enter the following privileged mode and configure global CoS to local priority mapping.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] cos map-local-priority</b> <i>cos-value1 {cos cos-value2   cng cng-bit }</i>	Sets the local priority mapping of cos. <i>cos-value1</i> is cos value defined IEEE802.1p, 0-7. <i>cos-value2</i> is remapping inner priority cos, 0-7.

	<i>cong-bit</i> is congestion bit of cos mapping.
<b>exit</b>	Exit from management configuration mode.
<b>write</b>	Saving the configuration.

### 46.3.3 Setting the Bandwidth of the CoS Priority Queue

The bandwidth of priority queue means the bandwidth distribution ratio of each priority queue, which is set when the schedule policy of the CoS priority queue is set to WRR/DRR. This series of switches has 8 priority queues in total.

If this command is run, the bandwidth of all priority queues on all interfaces are affected. This command validates only when the queue schedule policy is set to WRR or DRR. This command decides the bandwidth weight of the CoS priority queue when the WRR/DRR schedule policy is used.

Run the following commands one by one to set the bandwidth of the CoS priority queue.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] scheduler weight bandwidth</b> <i>weight1...weightn</i>	Sets the bandwidth of the CoS priority queue.. <b>weight1...weightn</b> stand for the weights of 8 CoS priority queues of WRR/DRR.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

### 46.3.4 Setting the Schedule Policy of the CoS Priority Queue

A switch has many output queues on each of its port. This series of switches has 8 priority queues. The output queues can adopt the following three schedule modes:

21. SP (Sheer Priority): In this algorithm, only when the high-priority queue is null can the packets in the low-priority queue be forwarded, and if there are packets in the high-priority queue these packets will be unconditionally forwarded.
22. In this mode, the bandwidth of each queue is distributed with a certain weight and then bandwidth distribution is conducted according to the weight of each queue. The bandwidth in this mode takes byte as its unit.
23. The First-Come-First-Served queue algorithm, which is shortened as FCFS, provides service to those packets according to their sequence of arriving at a switch, and the packet that first arrives at the switch will be served first.

Enter the following configuration mode and set the schedule policy of CoS priority queue.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] scheduler policy { sp   wrr wfq fcfs }</b>	Sets the schedule policy of the CoS priority queue. <b>sp</b> means to use the SP schedule policy. <b>Wrr</b> means to use the WRR schedule policy. <b>Fcfs</b> to use the FCFS schedule policy. <b>drr</b> means to use the DRR schedule policy.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

### 46.3.5 Configuring the Minimum and Maximum Bandwidths of CoS Priority Queue

The minimum and maximum bandwidths of CoS priority queue can be modified through configuration. All the flows with a bandwidth less than the configured minimum bandwidth shall not be dropped, but the flows with a bandwidth bigger than the configured maximum bandwidth shall all be dropped.

Enter the privileged mode.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] cos bandwidth</b> <i>quid min-bandwidth max-bandwidth</i>	<b>quid</b> stands for the priority queue. <b>min-bandwidth</b> means the minimum bandwidth. <b>max-bandwidth</b> means the maximum bandwidth.
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

### 46.3.6 Setting the Default CoS Value of a Port

If the port of a switch receives a data frame without tag, the switch will add a default CoS priority to it. Setting the default CoS value of a port is to set the untagged default CoS value, which is received by the port, to a designated value.

Enter the privilege mode and run the following commands to set the default CoS value of a port:

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] cos default</b> <i>cos</i>	Sets the CoS value of the received untagged frames. <b>cos</b> stands for the corresponding CoS value.
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

### 46.3.7 Setting the CoS Priority Queue of a Port

When a priority queue is set on a L2 port, the priority queue will be used by the L2 port; otherwise, you should

conduct the configuration of a global CoS priority queue.

Enter the privilege mode and run the following commands to set the default CoS value of a port:

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] cos map</b> <i>quid cos1..cosn</i>	Sets the CoS priority queue. <b>quid</b> stands for the ID of a CoS priority queue. <b>cos1...cosn</b> stands for the IEEE802.1p-defined CoS value.
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.

### 46.3.8 Setting Cos Priority Queue Based on dscp

The command is used to remap cos queue based on dscp value, modify dscp and the congestion bit.

Enters the privileged mode and configures CoS of the port.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no]dscp map</b> <i>word {dscp dscp-value   cos cos-value   cng cng-bit }</i>	Word configures dscp range table. Dscp-value Configures re-mapped dscp value. Cos-value Configures priority cos of mapping. Cog-bit Configures congestion bit of mapping.
<b>exit</b>	Exit from the global configuration mode.
<b>exit</b>	Exit from the management configuration mode.

### 46.3.9 Setting QoS Policy Mapping

QoS policy mapping refers to use a certain rule (based on MAC layer or IP header information) to identify packets with certain characteristics and adopt a certain action.

Do as follows to set a QoS policy.

Enters the privileged mode and configures CoS policy mapping.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no]policy-map</b> <i>name</i>	Enters QoS policy table configuration mode. <i>name</i> The name of policy
<b>exit</b>	Exit from the global configuration mode.
<b>exit</b>	Exit from the management mode.

### 46.3.10 Setting the Description of the QoS [Policy Mapping](#)

Enter the privileged mode and run the following commands to set the description of a QoS policy mapping. This settings will replace the previous settings.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no]policy-map name</b>	Enters the configuration mode of the QoS policy map. <b>name</b> stands for the name of the policy.
<b>description description-text</b>	Sets the description of the QoS policy. <b>description-text</b> stands for the text to describe the policy.
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.

### 46.3.11 Setting the Matchup Data Flow of the QoS Policy Mapping

The classification rule of the QoS data flow means the filtration rule configured by the administrator according to management requirements. It can be simple, for example, flows with different priorities can be identified by the ToS field of the IP packet's header, or complicated, for example, the packets can be classified according to the related information about the comprehensive link layer, the network layer and the transmission layer, such as the MAC address, the source address of IP, the destination address or the port ID of the application. In general, the classification standard is limited in the header of an encapsulated packet. It is rare to use the content of a packet as the classification standard.

Enter the policy configuration mode, set the match-up data flow of policy and replace the previous settings with this data flow according to the following steps:

Command	Purpose
<b>config</b>	<b>Enters the global configuration mode.</b>
<b>[no]policy-map name</b>	<b>Enters the configuration mode of the QoS policy map.</b> <b>name</b> stands for the name of the policy.
<b>description description-text</b>	<b>Sets the description of the QoS policy.</b> <b>description-text</b> stands for the text to describe the policy.
<b>classify {any   cos cos   icos icos   vlan vlanid   ivlan ivlanid   ethernet-type ethernet-type   precedence precedence-value   dscp dscp-value   tos tos-value   diffserv diffserv-value   ip ip-access-list   ipv6 ipv6-access-list}</b>	<b>Matches up with any packet.</b> <b>Configures the matched COS value which ranges between 0 and 7.</b> <b>icos</b> stands for the matched inner COS value which ranges between 0 and 7.

<p>  <b>mac</b> <i>mac-access-list</i> }</p> <p><b>no classify</b> { <b>cos</b>   <b>icos</b>   <b>vlan</b>   <b>ivlan</b>   <b>ethernet-type</b>   <b>precedence</b>   <b>dscp</b>   <b>tos</b>   <b>diffserv</b>   <b>ip</b>   <b>ipv6</b>   <b>mac</b> }</p>	<p><b>vlanid</b> stands for the matched VLAN, which ranges from 1 to 4094.</p> <p><b>ivlanid</b> stands for the matched inner VLAN, which ranges from 1 to 4094.</p> <p><b>ethernet-type</b> stands for the matched packet type, which is between 0x0600 and 0xFFFF.</p> <p><b>precedence-value</b> stands for the priority field in tos of IP packet, which ranges from 0 to 7.</p> <p><b>dscp-value</b> stands for the dscp field in tos of IP packet, which ranges from 0 to 63.</p> <p><b>tos-value</b> stands for latency, throughput, reliability and cost fields in tos of IP packet, which ranges from 0 to 15.</p> <p><b>diffserv-value</b> stands for the entire tos field.</p> <p><b>ip-access-list</b> stands for the name of the matched IP access list. The name has 1 to 20 characters.</p> <p><b>ipv6-access-list</b> stands for the name of the matched IPv6 access list. The name has 1 to 20 characters.</p> <p>Configures the name of the matched MAC access list. The name has 1 to -20 characters.</p>
<p><b>exit</b></p>	<p>Goes back to the global configuration mode.</p>
<p><b>exit</b></p>	<p>Goes back to the EXEC mode.</p>

### 46.3.12 Setting the Actions of the Match-up Data Flow of the QoS Policy Mapping

The actions to define the data flow mean to take corresponding actions to a data flow with compliance of the filtration rule, which include bandwidth limit, drop, update, etc.

Enter the privileged mode and run the following commands to set the action of a policy, matching up the data flow. The action will replace the previous settings.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no]policy-map</b> <i>name</i>	Enters the configuration mode of the QoS policy map. <b>name</b> stands for the name of the policy.
<b>action</b> { <b>bandwidth</b> <i>max-band</i>   { <b>cir</b>	<b>max-band</b> stands for the occupied maximum

<pre> commit-band {bc commit-burst-size {be peak-burst-size   pir pir-band } }   [conform {forward   dscp dscp- value}   exceed {forward   drop   dscp dscp-value   discardable {green   yellow   red}}   violate {forward   drop   dscp dscp-value   discardable {green   yellow   red}}]   cos cos   drop   dscp dscp-value   precedence precedence-value   forward   icos icos   ivlan {add ivlanid   del ivlanid   ivlanid}   cpicos   mac mac-addr   monitor session-value   queue queue-value   redirect interface-id   stat-packet   stat-byte   vlanID { add vlanid   vlanid }}  no action {bandwidth   cir   cos   drop   dscp   precedence   forward   icos   ivlan   cpicos   mac   monitor   queue   redirect   stat-packet   stat- byte   vlanID} </pre>	<p>bandwidth.</p> <p>Sets the policing:</p> <p><b>cir commit-band</b> stands for the certified bandwidth.</p> <p><b>bc commit-burst-size</b> stands for the size of burst packet, which ranges from 4 to 4096Kb.</p> <p><b>be peak-burst-size</b> stands for the size of peak burst, which ranges from 4 to 4096Kb.</p> <p><b>pir pir-band</b> stands for the peak bandwidth, which ranges from 1 to 163840.</p> <p><b>conform {forward   dscp dscp-value}</b> stands for a bandwidth guarantee action, among which <b>forward</b> means not to conduct any action and <b>dscp</b> means to change the dscp value.</p> <p><b>drop</b> means to drop the matched packets.</p> <p>Sets the matched DSCP field to <b>dscp-value 0~63</b>.</p> <p><b>precedence-value</b> stands for the priority field of tos in ip packet.0-7.</p> <p>Conducts no operations to the matched packets.</p> <p>Sets the matched COS field to cos-value 0-7.</p> <p><b>ivlanid</b> is used to replace, add or delete the inner VLAN ID.</p> <p><b>cpicos</b> means to replace the outer cos with inner cos.</p> <p><b>mac-addr</b> is used to set the destination MAC address.</p> <p><b>session-value</b> is used to set mirroring, which ranges from 1 to 4.</p> <p><b>queue-value</b> is used to set the mapping queue, which ranges from 1 to 8.</p> <p>Redirects the egress port of the matched flow.</p> <p><b>stat-packet</b> stands for the number of packets under statistics.</p> <p><b>stat-byte</b> means the number of bytes under statistics.</p> <p><b>vlanID</b> is used to replace or add the outer vlan ID, which ranges from 1 to 4094.</p>
<pre>exit</pre>	<p>Goes back to the global configuration mode.</p>
<pre>exit</pre>	<p>Goes back to the EXEC mode.</p>

### 46.3.13 Applying the QoS Policy on a Port

The QoS policy can be applied to a port; multiple QoS policies can be applied to the same port and the same QoS policy can also be applied to multiple ports. On the same port, the priorities of the policies which are earlier applied than those of the policies which are later applied. If a packet is set to have two policies and the

actions are contradicted, the actions of the firstly matched policies. After a QoS policy is applied on a port, the switch adds a policy to this port by default to block other data flows, which are not allowed to pass through. When all policies on a port are deleted, the switch will automatically remove the default blockage policy from a port.

Enter the following privileged mode and run the following commands to apply the QoS policy.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] qos policy name { ingress egress}</b>	Applies the QoS policy on a port. <b>name</b> stands for the name of QoS policy mapping. <b>ingress</b> means to exert an influence on the ingress. <b>egress</b> means to exert an influence on the egress.
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.

### 46.3.14 Configuring the Trust Mode

In the global configuration mode, trust of cos, dscp or untrust can be configured. When the data maps to the queue, the trusted mode chosen by the global will be mapped to the queue. If the configured trust mode is untrust, the default priority of the packet will be mapped to the queue.

Enters the management mode and do as the following steps:

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] qos trust { cos   dscp   untrust }</b>	Configures the trust mode in the global configuration mode. untrust refers to untrust of any mode.
<b>exit</b>	Exit to the management configuration mode.

### 46.3.15 Displaying the QoS Policy Mapping Table

You can run the **show** command to display all or some designated QoS policy maps.

Run the following command in privileged mode to display the QoS policy mapping table.

Command	Purpose
<b>show policy-map [policy-map-name]</b>	Displays all or some designated QoS policy maps. <b>policy-map-name</b> stands for the name of QoS mapping table.

## 46.4 QoS Configuration Example

### 46.4.1 Example for Applying the QoS Policy on a Port

The following example shows how to set packet's cos to 2 on port g0/2:

```
ip access-list extended ipacl
permit ip 192.168.20.2 255.255.255.255 192.168.20.210 255.255.255.255
!
policy-map pmap
classify ip ipacl
action cos 2
!
interface g0/2
qos policy pmap ingress
!
```

## 46.5 DoS Attack Overview

# Chapter 47 DoS Attack Prevention Configuration

## 47.1 Concept of DoS Attack

The DoS attack is also called the service rejection attack. Common DoS attacks include network bandwidth attacks and connectivity attacks. DoS attack is a frequent network attack mode triggered by hackers. Its ultimate purpose is to break down networks to stop providing legal users with normal network services.

DoS attack prevention requires a switch to provide many attack prevention methods to stop such attacks as Pingflood, SYNflood, Landattack, Teardrop, and illegal-flags-contained TCP. When a switch is under attack, it needs to judge which attack type it is and handles these attack packets specially, for example, sending them to CPU and drop them.

## 47.2 DoS Attack Type

Hackers will make different types of DoS attack packets to attack the servers. The following are common DoS attack packets:

## **Ping of Death**

Ping of Death is the abnormal Ping packet, which claims its size exceeds the ICMP threshold and causes the breakdown of the TCP/IP stack and finally the breakdown of the receiving host.

## **TearDrop**

TearDrop uses the information, which is contained in the packet header in the trusted IP fragment in the TCP/IP stack, to realize the attack. IP fragment contains the information that indicates which part of the original packet is contained, and some TCP/IP stacks will break down when they receive the fake fragment that contains the overlapping offset.

## **SYN Flood**

A standard TCP connection needs to experience three hand-shake processes. A client sends the SYN message to a server, the server returns the SYN-ACK message, and the client sends the ACK message to the server after receiving the SYN-ACK message. In this way, a TCP connection is established. SYN flood triggers the DoS attack when the TCP protocol stack initializes the hand-shake procedure between two hosts.

## Land Attack

The attacker makes a special SYN message (the source address and the destination address are the same service address). The SYN message causes the server to send the SYN-ACK message to the sever itself, hence this address also sends the ACK message and creates a null link. Each of this kinds of links will keep until the timeout time, so the server will break down. Landattack can be classified into IPland and MACland.

### 47.3 DoS Attack Prevention Configuration Task List

As to global DoS attack prevention configuration, you configure related sub-functions and then the switch drops corresponding DoS attack packets. Hence, the bandwidth of the switch is guaranteed not to be used up.

DoS attack prevention configuration tasks are shown below:

Configuring Global DoS Attack Prevention

Displaying All DoS Attack Prevention Configuration

### 47.4 DoS Attack Prevention Configuration Tasks

#### 47.4.1 Configuring Global DoS Attack Prevention

Configuring global DoS attack prevention means configuring DoS attack prevention sub-functions in global mode and each sub-function can prevent a different type of DoS attack packets. The DoS IP sub-function can prevent the LAND attacks, while the DoS ICMP sub-function can prevent Ping of Death. You can set the corresponding sub-function according to actual requirements.

Configure the DoS attack prevention function in EXEC mode.

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>[no] dos enable {all   icmp <i>icmp-value</i>   ip   ipv4firstfrag   l4port   mac   tcpflags   tcpfrag <i>tcpfrag-value</i>}</b>	Configures <b>all</b> to prevent all types of DoS attack packets.  Configures <b>icmp</b> to prevent the ICMP packets, among which the <b>icmp-value</b> means the maximum length of the ICMP packet.  Configures <b>ip</b> to prevent those IP packets whose source IPs are the same as the destination IPs.  Configures <b>ipv4firstfrag</b> to check the first fragment of the IP packet.  Configures <b>l4port</b> to prevent those TCP/UDP packets whose source port IDs are destination port IDs.

	<p>Configures <b>mac</b> to prevent those packets whose source MACs are destination MACs.</p> <p>Configures <b>tcpflags</b> to prevent those TCP packets containing illegal TCP flags.</p> <p>Configures <b>tcpfrag</b> to prevent those TCP packets whose minimum TCP header is <b>tcpfrag-value</b>.</p>
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

## 47.4.2 Displaying All DoS Attack Prevention Configurations

You can display the Dos attack prevention configurations through the **show** command.

Run the following command in EXEC mode to display the configured DoS attack prevention functions.

Command	Purpose
<b>show dos</b>	Displays Dos attack prevention configuration.

## 47.5 DoS Attack Prevention Configuration Example

The following example shows how to configure to prevent the attacks of TCP packets, which have illegal flags, and then displays user's configuration.

```
config
dos enable tcpflags
show dos
```

The following example shows how to prevent the attacks of IP packets whose source IPs are destination IPs in global mode.

```
config
dos enable ip
```

The following example shows how to prevent in global mode the attacks of ICMP packets whose maximum length is more than 255.

```
config
dos enable icmp 255
```

# Chapter 48 Attack Prevention Introduction

## 48.1 Overview of Filter

To guarantee the reasonable usage of network bandwidth, this switch series provides the function to prevent vicious traffic from occupying lots of network bandwidth.

Filter can identify the packets received by the interface of the switch and calculate them according to the packet type. In light of current attack modes, Filter can calculate the number of ARP, IGMP or IP message that a host sends in a time. Once the number exceeds the threshold, the SWITCH will not provide any service to these hosts.

Filter limits the packet from a certain host by blocking the source address. For ARP attack, Filter blocks source MAC address; for IP attacks, such as Ping scan and TCP/UDP scan, Filter blocks source IP address.

## 48.2 The Mode of Filter

The mode of Filter determines how the switch specifies the attack source. There are two modes of Filter.

### Source Address Block Time (Raw)

In Raw mode, the switch will drop packets from the attack source in scheduled block-time since the attack source is determined. After block-time, the restriction on the attack source will be removed and a new calculation will be enabled.

In Raw mode, all the packets from the source address will be blocked. For instance, when the MAC address of the attack source is blocked, all packets whose source MAC address are the same with that of the attack source will be dropped, no matter it is ARP, ICMP, DHCP or other types.

### Source Address Block Polling (Hybrid)

After blocking the attack source, the switch will continue calculate the packets from the attack source and detect whether the packet number exceeds the threshold before the end of Polling Interval. If the packet number exceeds the threshold, the blocking state keeps. Otherwise, the blocking will be removed. In Hybrid Mode, the packet number when initially determining the attack source and the threshold of the packet number in Polling can be configured independently.

To realize continually calculate the packet, in the hybrid mode the packet type will be matched while the source address is blocked. For instance, if the MAC address of a host is blocked as it triggers ARP attack, IP packets from the host will be sent by the switch continually, unless the host is also identified with the existence of IP attack.

Please select the mode of Filter according to your application environment. If you want to set a strict limit on the attack source and reduce the burden of switch CPU, please use Raw mode; if you want to control the attack source flexibly and resume communication of the host as soon as possible after the end of the attack, please use Hybrid mode. Note that the Filter number a switch can support in Hybrid mode is limited. In condition of inadequate Filter number, Raw mode will be adopted automatically.

# Chapter 49 Attack Prevention Configuration

## 49.1 Attack Prevention Configuration Tasks

When the number of IGMP, ARP or IP message that is sent by a host in a designated interval exceeds the threshold, we think that the host attack the network.

You can select the type of attack prevention (ARP, IGMP or IP), the attack prevention port and the attack detection parameter. You have the following configuration tasks:

- [Configuring the attack filter parameters](#)
- [Configuring the attack prevention type](#)
- [Enables the attack prevention function.](#)
- [Checking the State of Attack Prevention](#)

## 49.2 Attack Prevention Configuration

### 49.3 Configuring the Attack Filter Parameters

In global configuration mode, run the following command to configure the parameters of Filter.

Command	Purpose
Switch# config	Enters the global configuration mode.
Switch_config# <b>filter period</b> <i>time</i>	Sets the attack filter period to time. Its unit is second.
Switch_config# <b>filter threshold</b> [ arp   bpdu   dhcp   igmp   ip   <b>icmp</b> ] <i>value</i>	Sets the attack filter threshold to value.
Switch_config# <b>filter block-time</b> <i>time</i>	Sets the out-of-service time (block-time) for the attack source when the attack source is detected. Its unit is second.
Switch_config# filter polling period <i>time</i>	Sets the filter polling period in Hybrid mode. Its unit is second.
Switch_config# filter polling threshold [ arp   bpdu   dhcp   igmp   ip   icmp   icmpv6 ] <i>value</i>	Sets the filter polling threshold in Hybrid mode.
Switch_config# filter polling auto-fit	Sets the corresponding parameters of period and threshold of polling filter which adapts to the attack source filter. The command is efficient by default. The polling period equals with the attack filter period and the polling

	packet threshold equals to 3/4 of the attack filter packet threshold
Switch_config# filter shutdown-action	Sets shutdown of the port when detecting the attack source in raw mode.

### 49.3.1 Configuring the Attack Prevention Type

In global and interface configuration mode, use the following command to configure the type of attack filter.

Command	Purpose
Switch# config	Enters the global configuration mode.
Switch_config# filter dhcp	Enables DHCP packet attack filter in the global configuration mode.
Switch_config# filter icmp	Enables ICMP packet attack filter.
Switch_config# filter icmpv6	Enables ICMPv6 packet attack detection.
Switch_config# filter igmp	Enables IGMP packet attack filter.
Switch_config# filter ip source-ip	Enables IP attack filter in the global configuration mode.
Switch_config# interface intf-name	Enters the interface configuration mode.
Switch_config_intf# filter arp	Enables ARP packet attack filter on the interface.
Switch_config_intf# filter bpdu	Enables BPDU packet attack filter on the interface.
Switch_config_intf# filter dhcp	Enables DHCP packet attack filter on the interface.
Switch_config_intf# filter icmp	Enables ICMP packet attack filter on the interface.
Switch_config_intf# filter icmpv6	Enables ICMPv6 packet attack detection on the interface.
Switch_config_intf# filter ip source-ip	Enables IP packet attack filter on the interface.

**Note:**

ARP attack takes the combination "the host mac address + the source port" as an attack source. That is to say, packets with the same MAC address but coming from different ports, the count will not be accumulated. Both the IGMP attack and IP attack take the host's IP address and source port as the attack source.

Note:

1. The IGMP attack prevention and the IP attack prevention cannot be started up together.

2. IP, ICMP, ICMPv6 and DHCP filter take effect only in global and interface configuration mode.

### 49.3.2 Enabling the Attack Prevention Function

After all parameters for attack prevention are set, you can start up the attack prevention function. Note that small parts of processor source will be occupied when the attack prevention function is started.

Command	Purpose
Switch_config# <b>filter enable</b>	Enables the attack prevention function.
Switch_config# filter mode [ raw   hybrid ]	Sets the mode of Filter: Raw or Hybrid.

Use the no filter enable command to disable the attack prevention function and remove the block to all attack sources.

### 49.3.3 Checking the State of Attack Prevention

After attack prevention is started, you can run the following command to check the state of attack prevention:

Command	Purpose
<b>show filter</b>	After attack prevention is started, you can run the following command to check the state of attack prevention:
<b>show filter summary</b>	Checks the parameter configuration and summary information of Filter.

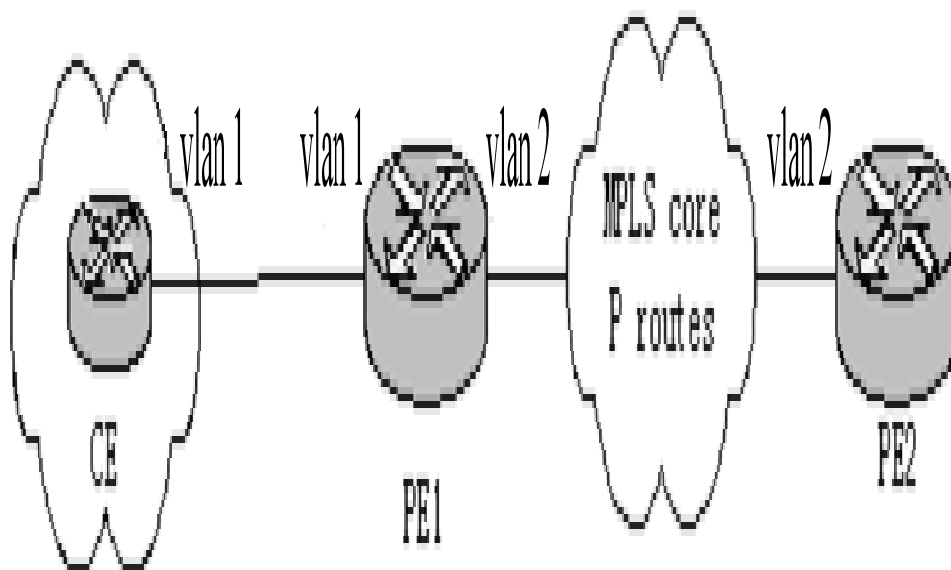

# Chapter 50 Attack Prevention Configuration Example

Note:

The examples shown in this chapter is only a reference for Filter configuration. Please configure according to your actual network condition.

## 50.1 Using Filter ARP to Protect the LAN

As shown in the following figure, configure ARP attack Filter on Switch.

Sets the parameter of Filter. A host sending more than 100 ARP messages in 10s will be taken as an attack source.

```
Switch# config
```

```
Switch_config# filter period 10
```

```
Switch_config# filter threshold arp 100
```

Sets APR attack filter with 4 ports:

```
Switch_config# interface range g0/1 – 4
```

```
Switch_config_intf# filter arp
```

Sets Raw mode and enable Filter:

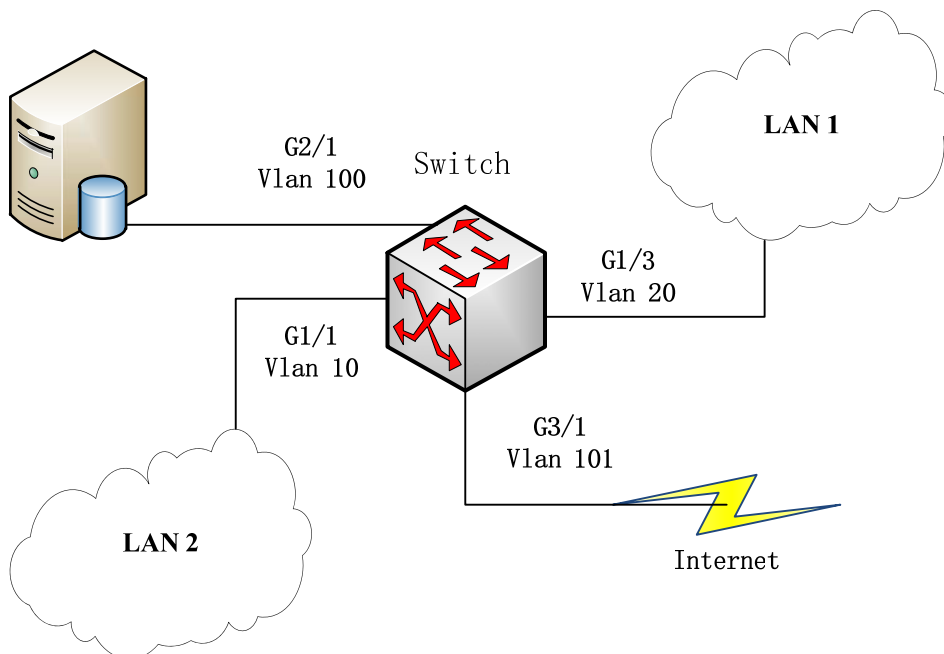

```
Switch_config_intf# exit
```

```
Switch_config# filter mode raw
```

```
Switch_config# filter enable
```

## 50.2 Using Filter IP to Protect Layer-3 Network

As shown in the following figure, Switch is connected to multiple LANs, servers and the internet. IP packet attack prevention can block IP scan of cross-subnet and large network connections triggered by BitTorrent in a short time.

Sets the parameter of Filter. A host sending more than 300 ARP messages in 1 minute will be taken as an attack source.

```
Switch# config
```

```
Switch_config# filter period 60
```

```
Switch_config# filter threshold ip 300
```

Enable IP packet filter in the global configuration mode and the interface mode. Note that the interface connecting the server and the external network is no need to configure:

```
Switch_config# filter ip source-ip
```

```
Switch_config# interface g1/1
```

```
Switch_config_g1/1# filter ip source-ip
```

```
Switch_config_g1/1# interface g1/3
```

```
Switch_config_g1/3# filter ip source-ip
```

```
Switch_config_g1/3# exit
```

```
Switch_config#
```

Enables Filter:

```
Switch_config# filter enable
```

# Chapter 51 Configuring IP Addressing

## 51.1 IP Introduction

### 51.1.1 IP

Internet Protocol (IP) is a protocol in the network to exchange data in the text form. IP has the functions such as addressing, fragmenting, regrouping and multiplexing. Other IP protocols (IP protocol cluster) are based on IP. As a protocol working on the network layer, IP contains addressing information and control information which are used for routing.

Transmission Control Protocol (TCP) is also based on IP. TCP is a connection-oriented protocol which regulates the format of the data and information in data transmission. TCP also gives the method to acknowledge data is successfully reached. TCP allows multiple applications in a system to communicate simultaneously because it can send received data to each of the applications respectively.

The IP addressing, such as Address Resolution Protocol, are to be described in section “Configuring IP Addressing.” IP services such as ICMP, HSRP, IP statistics and performance parameters are to be described in “Configuring IP Services.”

### 51.1.2 IP Routing Protocol

Our routing SWITCH supports multiple IP routing dynamic protocols, which will be described in the introduction of each protocol.

IP routing protocols are divided into two groups: Interior Gateway Routing Protocol (IGRP) and Exterior Gateway Routing Protocol (EGRP). GP3616 Series SWITCH supports RIP and OSPF. You can configure RIP and OSPF respectively according to your requirements. Our SWITCH also supports the process that is to configure multiple routing protocols simultaneously, a random number of OSPF processes (if memory can be distributed), a BGP process, a RIP process and a random number of BEIGRP processes. You can run the redistribute command to redistribute the routes of other routing protocols to the database of current routing processes, connecting the routes of multiple protocol processes.

To configure IP dynamic routing protocols, you must first configure relevant processes, make relevant network ports interact with dynamic routing processes, and then designate routing processes to be started up on the ports. To do this, you may check configuration steps in configuration command documents.

#### (1) Choosing Routing Protocol

It is a complex procedure to choose routing protocol. When you choose the routing protocol, consider the following items:

- Size and complexity of the network
- Whether the length-various network need be supported
- Network traffic
- Safety requirements
- Reliability requirements
- Strategy

- Others

Details of the above items are not described in the section. We just want to remind you that your network requirements must be satisfied when you choose the routing protocols.

#### (2) IGRP

Interior Gateway Routing Protocol (IGRP) is used for network targets in an autonomous system. All IP IGRPs must be connected with networks when they are started up. Each routing process monitors the update message from other routing devices in the network and broadcasts its routing message in the network at the same time. GP3616 Series SWITCH supports following internal routable protocols:

RIP

OSPF

#### (3) EGRP

Exterior Gateway Routing Protocol (EGRP) is used to exchange routing information between different autonomous systems. Neighbors to exchange routes, reachable network and local autonomous system number generally need to be configured. GP3616 Series SWITCH does not support external routable protocols at present:

## 51.2 Configuring IP Address Task List

An essential and mandatory requirement for IP configuration is to configure the IP address on the network interface of the routing SWITCH. Only in this case can the network interface be activated, and the IP address can communicate with other systems. At the same time, you need to confirm the IP network mask.

To configure the IP addressing, you need to finish the following tasks, among which the first task is mandatory and others are optional.

For creating IP addressing in the network, refer to section “IP Addressing Example.”

IP address configuration task list:

- Configuring IP address at the network interface
- Configuring multiple IP addresses at the network interface
- Configuring Address Resolution
- Configuring broadcast packet processing
- Detecting and maintaining IP addressing

## 51.3 Configuring IP Address

### 51.3.1 Configuring IP Address at the Network Interface

The IP address determines the destination where the IP message is sent to. Some IP special addresses are reserved and they cannot be used as the host IP address or network address. Table 1 lists the range of IP addresses, reserved IP addresses and available IP addresses.

Type	Address or Range	Status
A	0.0.0.0	Reserved

	1.0.0.0 to 126.0.0.0	Available
	127.0.0.0	Reserved
B	128.0.0.0 to 191.254.0.0	Available
	191.255.0.0	Reserved
C	192.0.0.0	Reserved
	192.0.1.0 to 223.255.254	Available
	223.255.255.0	Reserved
D	224.0.0.0 to 239.255.255.255	Multicast address
E	240.0.0.0 to 255.255.255.254	Reserved
	255.255.255.255	Broadcast

The official description of the IP address is in RFC 1166 “Internet Digit”. You can contact the Internet service provider.

An interface has only one primary IP address. Run the following command in interface configuration mode to configure the primary IP address and network mask of the network interface:

Command	Purpose
<b>ip address</b> <i>ip-address mask</i>	Configure the main IP address of the interface.

The mask is a part of the IP address, representing the network.

Note:

Our SWITCH only supports masks which are continuously set from the highest byte according to the network character order.

### 51.3.2 Configuring Multiple IP Addresses at the Network Interface

Each interface can possess multiple IP addresses, including a primary IP address and multiple subordinate IP addresses. You need to configure the subordinate IP addresses in the following two cases:

If IP addresses in a network segment are insufficient. For example, there are only 254 available IP addresses in a certain logical subnet, however, 300 hosts are needed to connect the physical network. In this case, you can configure the subordinate IP address on the SWITCH or the server, enabling two logical subnets to use the same physical subnet.

Most of early-stage networks which are based on the layer-2 bridge are not divided into multiple subnets. You can divide the early-stage network into multiple route-based subnets by correctly using the subordinate IP addresses. Through the configured subordinate IP addresses, the routing SWITCH in the network can know

multiple subnets that connect the same physical network.

If two subnets in one network are physically separated by another network. In this case, you can take the address of the network as the subordinate IP address. Therefore, two subnets in a logical network that are physically separated, therefore, are logically connected together.

Note:

If you configure a subordinate IP address for a routing SWITCH in a network segment, you need to do this for other routing SWITCH in the same network segment.

Run the following command in interface configuration mode to configure multiple IP addresses on the network interface.

Command	Purpose
<b>ip address <i>ip-address mask secondary</i></b>	Configures multiple IP addresses on the network interface.

Note:

When the IP routing protocol is used to send the route update information, subordinate IP addresses may be treated in different ways.

### 51.3.3 Configuring Address Resolution

IP can realize functions such as IP address resolution control. The following sections show how to configure address resolution:

#### (1) Creating Address Resolution

An IP device may have two addresses: local address (local network segment or device uniquely identified by LAN) and network address (representing the network where the device is located). The local address is the address of the link layer because the local address is contained in the message header at the link layer, and is read and used by devices at the link layer. The professionals always call it as the MAC address. This is because the MAC sub layer in the link layer is used to process addresses.

For example, if you want your host to communicate with a device on Ethernet, you must know the 48-bit MAC address of the device or the local address of the link layer. The process on how to obtain the local address of the link layer from the IP address is called as Address Resolution Protocol (ARP). The process on how to obtain the IP address from the local address of the link layer is called as Reverse Address Resolution (RARP). Our system adopts address resolution in two types: ARP and proxy ARP. The ARP and proxy ARP are defined in RFC 860 and 1027 respectively.

ARP is used to map IP addresses to media or MAC address. When the IP address is known, ARP will find the corresponding MAC address. When the MAC address is known, the mapping relationship between IP address and MAC address is saved in ARP cache for rapid access. The IP message is then packaged in the message at the link layer and at last is sent to the network.

Defining a static ARP cache

ARP and other address resolution protocols provide a dynamic mapping between IP address and MAC address.

The static ARP cache item is generally not required because most hosts support dynamic address resolution. You can define it in global configuration mode if necessary. The system utilizes the static ARP cache item to translate the 32-bit IP address into a 48-bit MAC address. Additionally, you can specify the routing SWITCH to respond to the ARP request for other hosts.

You can set the active period for the ARP entries if you do not want the ARP entry to exist permanently. The following two types show how to configure the mapping between the static IP address and the MAC address. Run one of the following commands in global configuration mode:

Command	Purpose
<b>arp ip-address hardware-address vlan vlan-id</b>	Globally maps an IP address to a MAC address in the ARP cache.
<b>arp ip-address hardware-address vlan vlan-id alias</b>	Specifies the routing SWITCH to respond to the ARP request of the designated IP address through the MAC address of the routing SWITCH.

Run the following command in VLAN interface configuration mode:

Command	Purpose
<b>arp timeout seconds</b>	Sets the timeout time of the ARP cache item in the ARP cache.
<b>arp dynamic</b>	Enables arp dynamic learning in the interface

Run `show interfaces` to display the ARP timeout time of the designated interface. Run the `show arp` to check the content of the ARP cache. Run `clear arp-cache` to delete all entries in the ARP cache.

#### Activating proxy ARP

The system uses the proxy ARP (defined by RFC 1027) to obtain the host's MAC address on other networks for the hosts without corresponding routes. For example, when the routing SWITCH receives an ARP request and finds that the source host and the destination host are not connected to the same interface and all the routes that the routing SWITCH reaches the destination host are not through the interface that receives the ARP request, it will send a proxy ARP response that contains its address of the link layer. The source host then sends the message to the routing SWITCH and the SWITCH forwards it to the destination host. The proxy ARP is activated by default.

To activate the proxy ARP, run the following command in interface configuration mode:

Command	Purpose
---------	---------

<b>ip proxy-arp</b>	Activates the proxy ARP on the interface.
---------------------	---

#### Configuring free ARP function

The SWITCH can know whether the IP addresses of other devices collide with its IP address by sending free ARP message. The source IP address and the destination IP address contained by free ARP message are both the local address of the SWITCH. The source MAC address of the message is the local MAC address. The SWITCH processes free ARP message by default. When the SWITCH receives free ARP message from a device and finds that the IP address contained in the message collide with its own IP address, it will return an ARP answer to the device, informing the device that the IP addresses collide with each other. At the same time, the SWITCH will inform users by logs that IP addresses collide.

The SWITCH's function to send free ARP message is disabled by default. Run the following commands to configure the free ARP function on the port of the SWITCH:

Command	Purpose
<b>arp send-gratuitous</b>	Starts up free ARP message transmission on the interface.
<b>arp send-gratuitous interval</b> <i>value</i>	Sets the interval for sending free ARP message on the interface.  The default value is 120 seconds.

To set the waiting time of ARP cache resolution, run the following command.

The SWITCH will create incomplete ARP entry when first resolve arp. The incomplete entry will create complete ARP entry when the opposite end responses correct arp reply packet. At this point, the ARP resolution is finished.

Run following command to set the time to live of the incomplete entry.

Command	Purpose
<b>arp pending-time</b> <i>seconds</i>	Sets the waiting time of ARP cache resolution, run the following command: The default value is 15 seconds.

Set the maximum number of incomplete ARP entries.

Command	Purpose
<b>arp max-incomplete</b> <i>number</i>	Sets the maximum number of incomplete ARP entries. The default is 0.

To set the maximum retransmissions of the Re-Detect packets, run the following command.

The ARP entries (to be tagged with G), which the routing entry gateway depends on, require being re-detected at their aging so that the promptness and correctness of the hardware subnet routing can be guaranteed. The greater the retransmission times, the more likely to re-detect.

Command	Purpose
<b>arp max-gw-retries</b> <i>number</i>	Sets the maximum retransmissions of the Re-Detect packets. The default is 3.

Set re-detection when ARP entry is aging.

By default only ARP depends on routing entry has re-detection when aging. After enable this command, all ARP entries will adopt aging re-detection mechanism.

Command	Purpose
<b>arp retry-allarp</b>	Sets re-detection when the ARP entry is aging.

#### (2) Mapping Host Name to IP Address

Any IP address can correspond to a host name. The system has saved a mapping (host name to address) cache which can be telneted or pinged.

To designate a mapping from host name to address, run the following commands in global mode:

Command	Purpose
<b>ip host</b> <i>name address</i>	Statically maps the host name to the IP address.

### 51.3.4 Configuring Routing Process

You can configure one or multiple routing protocols according to your actual network requirements. The routing protocol provides information about the network topology. The details about configuring IP routing protocols such as BGP, RIP and OSPF are shown in the following sections.

### 51.3.5 Configuring Broadcast Packet Process

The destination addresses of the broadcast message are all the hosts on a physical network. The host can identify the broadcast message through special address. Some protocols, including some important Internet protocols, frequently use the broadcast message. One primary task of the IP network administrator is to control the broadcast message. The system supports the directed broadcast, that is, the broadcast of designated network. The system does not support the broadcast of all subnets in a network.

Some early-stage IP's do not adopt the current broadcast address standard. The broadcast address adopted by these IPs is represented completely by the number "0", not "1" completely. The system can simultaneously

identify and receive message of the two types.

(1) Allowing Translating from Directed Broadcast to Physical Broadcast

By default, the IP directional broadcast packets will be dropped, rather than being forwarded. Dropping the IP directional broadcast packet is conducive to prevent the routing SWITCH from attacks of "refusal service".

You can activate the function of forwarding directed IP broadcast on the interface where the directed broadcast is transformed to the physical message. If the forwarding function is activated, all the directed broadcast message of the network that connects the interface will be forwarded to the interface. The message then will be sent as the physical broadcast message.

You can designate an access table to control the forwarding of broadcast message. After the access table is specified, only IP message that the access table allows can be transformed from the directed broadcast to the physical broadcast.

Run the following command in interface configuration mode to activate the forwarding of the directed broadcast.

Command	Purpose
<b>ip directed-broadcast</b> [ <i>access-list-name</i> ]	Allows the translation from the directed broadcast to the physical broadcast on the interface.

(2) Forwarding UDP Broadcast Message

Sometimes, the host uses the UDP broadcast message to determine information about the address, configuration and name, and so on. If the network where the host is located has no corresponding server to forward the UDP message, the host cannot receive any of the UDP message. To solve the problem, you can do some configuration on the corresponding interface to forward some types of broadcast message to an assistant address. You can configure multiple assistant addresses for an interface.

You can designate a UDP destination port to decide which UDP message is to be forwarded. Currently, the default forwarding destination port of the system is UDP packet of NetBIOS name service (port 137).

Run the following command in interface configuration mode to allow message forwarding and to specify the destination address:

Command	Purpose
<b>ip helper-address</b> <i>address</i>	Allows to forward the UDP broadcast message and to specify the destination address.

Run the following command in global configuration mode to specify protocols to be forwarded:

Command	Purpose
<b>ip forward-protocol udp</b> [ <i>port</i> ]	Specifies which interfaces' UDP protocols will be forwarded.

## 51.3.6 Detecting and Maintaining IP Address

To detect and maintain the network, run the following command:

### (1) Clearing Cache, List and Database

Clearing cache, list and database You can clear all content in a cache, list or the database. When you think some content is ineffective, you can clear it.

Run the following command in management mode to clear the cache, list and database:

Command	Purpose
<b>clear arp-cache</b>	Clears the IP ARP cache.

### (2) Displaying Statistics Data about System and Network

The system can display designated statistics data, such as IP routing table, cache and database. All such information helps you know the usage of the systematic resources and solve network problems. The system also can display the reachability of the port and the routes that the message takes when the message runs in the network.

All relative operations are listed in the following table. For how to use these commands, refer to Chapter “IP Addressing Commands”. Run the following commands in management mode:

Command	Purpose
<b>show arp</b>	Displays content in the ARP table.
<b>show hosts</b>	Displays the cache table about hostname-to-IP mapping.
<b>show ip interface</b> [ <i>type number</i> ]	Displays the state of a port.
<b>ping</b> { <i>host</i>   <i>address</i> }	Tests the reachability of the network node.

## 51.4 IP Addressing Example

The following case shows how to configure the IP address on interfaceVLAN11.

```
interface vlan 11
```

```
ip address 202.96.2.3 255.255.255.0
```

# Chapter 52 Configuring DHCP

## 52.1 Overview

Dynamic Host Configuration Protocol (DHCP) is used to provide some network configuration parameters for the hosts on the Internet, which is described in details in RFC 2131. One of the major functions of DHCP is to distribute IPs on an interface. DHCP supports the following three IP distribution mechanism:

Automatic distribution

The DHCP server automatically distributes a permanent IP address to a client.

Dynamic distribution

The DHCP server distributes an IP address for a client to use for a certain period of time or until the client does not use it.

Manual distribution

The administrator of the DHCP server manually specifies an IP address and through the DHCP protocol sends it to the client.

### 52.1.1 DHCP Application

DHCP can be applied at the following cases: You can distribute IP address, network segment and related sources (such as relevant gateway) to an Ethernet interface by configuring the DHCP client.

When an SWITCH that can access DHCP connects multiple hosts, the SWITCH can obtain an IP address from the DHCP server through the DHCP relay and then distribute the address to the hosts.

### 52.1.2 Advantages of DHCP

In current software version, the DHCP client or the DHCP client on the Ethernet interface is supported. DHCP has the following strong points:

Fastening the settings;

Reducing configuration errors;

Controlling IP addresses of some device ports through the DHCP server

### 52.1.3 DHCP Terms

DHCP is based on the server/client mode. So the DHCP server and the DHCP client must exist at the same time:

DHCP-Server

It is a device to distribute and recycle the DHCP-related sources such as IP addresses and lease time.

DHCP-Client

It is a device to obtain information from the DHCP server for devices of the local system to use, such as IP address information.

In a word, there exists lease time during the process of dynamic DHCP distribution:

Lease time – it means the effective period of an IP, which starts from the distribution. After the lease time, the

DHCP server withdraws the IP. To continue to use this IP, the DHCP client needs to apply it again.

## 52.2 Configuring DHCP Client

### 52.2.1 Configuration Task List of DHCP Client

- Obtaining an IP address
- Specifying an address for DHCP server
- Configuring DHCP parameters
- Monitoring DHCP

### 52.2.2 DHCP Client Configuration Tasks

#### (1) Obtaining an IP address

Run the following command on the VLAN interface to obtain an IP address through the DHCP protocol for an interface.

Command	Purpose
<b>ip address dhcp</b>	Sets the IP address of an Ethernet interface through DHCP.

#### (2) Specifying an Address for DHCP Server

If knowing the addresses of some DHCP servers, you can specify these servers' addresses on SWITCH so as to reduce the time of protocol processing. You can run the following command in global mode:

Command	Purpose
<b>ip dhcp-server</b> <i>ip-address</i>	Specifies the IP address of the DHCP server.

The command is optional when you perform operations to "obtain an IP address".

#### (3) Configuring DHCP Parameters

To adjust the parameters of DHCP communication according to actual requirements, run the following commands in global mode:

Command	Purpose
<b>ip dhcp client minlease</b> <i>seconds</i>	Specifies the acceptable minimum lease time.
<b>ip dhcp client retransmit</b> <i>count</i>	Specifies the retransmission times for DHCP packet.
<b>ip dhcp client select</b> <i>seconds</i>	Specifies the interval for SELECT.
<b>ip dhcp client class_identifier</b> <i>WORD</i>	Specifies the classification code of the

	provider.
<b>ip dhcp client client_identifier hrd_ether</b>	Specifies the client ID as the Ethernet type
<b>ip dhcp client timeout_shut</b>	Specifies client timeout shutdown of the interface
<b>ip dhcp client retry_interval &lt;1-1440&gt;</b>	Sets the re-transmission time.
<b>ip dhcp client bootfileaddmac</b>	Enables DHCP file name to add MAC address of the client
<b>ip dhcp client tftpdownload</b>	Enables TFTP download function

The command is optional when you perform operations to "obtain an IP address".

#### (4) Monitoring DHCP

To browse related information of the DHCP server, which is discovered by SWITCH currently, run the following command in EXEC mode:

Command	Purpose
<b>show dhcp server</b>	Displays related information about the DHCP server, which is known by SWITCH.

To browse which IP address is currently used by SWITCH, run the following command in EXEC mode:

Command	Purpose
<b>show dhcp lease</b>	Displays IP resources, which are currently used by the SWITCH, and related information.

Additionally, if you use DHCP to distribute an IP for an Ethernet interface, you can also run show interface to browse whether the IP address required by the Ethernet interface is successfully acquired.

### 52.2.3 DHCP Client Configuration Example

DHCP Client configuration example is shown below:

#### (1) Obtaining an IP Address

The following example shows interface vlan11 obtains an IP address through DHCP.

!

```
interface vlan 11
ip address dhcp
```

## 52.3 Configuring DHCP Server

### 52.3.1 DHCP Server Configuration Tasks

- Enabling DHCP server
- Disabling DHCP server
- Configuring ICMP detection parameter
- Configuring database storage parameter
- Configuring the address pool of DHCP server
- Configuring the parameter for the address pool of DHCP server
- Monitoring DHCP server
- Clearing information about DHCP server

### 52.3.2 Setting the Address Pool of DHCP Server

#### (1) Enabling DHCP Server

To enable the DHCP server and distribute IP addresses for DHCP client, run the following commands in global mode (thereupon, the DHCP server also supports the relay operation; As to those IPs that the DHCP server cannot distribute, the interface on which IP helper-address is configured will forward the DHCP request)

Command	Purpose
<b>ip dhcpd enable</b>	Enables DHCP server

#### (2) Disabling DHCP Server Service

To disable DHCP server and stop distributing parameters such as IP address parameter for the DHCP client, run the following command in global configuration mode:

Command	Purpose
<b>no ip dhcpd enable</b>	Disables DHCP server

#### (3) Configuring ICMP Detection Parameter

You can adjust the parameters of ICMP packet transmission according to actual requirements when the DHCP server is checking addresses.

To set the number of ICMP packets to be sent, run the following command in global mode:

Command	Purpose
<b>ip dhcpd ping packets <i>pkgs</i></b>	Sets how many ICMP packets to be sent during address checkup.

To set the timeout time of ICMP response, run the following command in global mode:

Command	Purpose
---------	---------

<b>ip dhcpd ping timeout</b> <i>timeout</i>	Sets the timeout time of ICMP response.
---	---

(4) Setting a Parameter to Clear the “Abandoned” Mark

To set the interval of clearing the “Abandoned” mark, run the following command in global mode:

Command	Purpose
<b>ip dhcpd abandon-time</b> <i>time</i>	Sets the interval of clearing the “Abandoned” mark.

(5) Configuring Database Storage Parameter

To set the interval of storing the address distribution information to the agent database, run the following command in global mode:

Command	Purpose
<b>ip dhcpd write-time</b> <i>time</i>	Sets the interval for storing the address distribution information to the agent database.

(6) Configuring DHCP File Domain

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd bootfile-name</b> <i>word</i>	The command is used to configure DHCP file domain.

(7) Configuring DHCP Enabling File Name Option

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd bootfile-option</b>	The following command is used to configure DHCP enabling file name option.

(8) Configuring DHCP Supporting BOOTP Client

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd bootp [auto-bind]</b>	The command is used to configure DHCP supporting BOOTP client.

	auto-bind means to allow BOOTP client distributing auto binding address.
--	--

(9) Configuring DHCP Database Server Address

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd database-agent <i>ip-address</i></b>	<p>Configures DHCP database server address, run the following command.</p> <p>If this address is not set, the address distribution information will be saved to the flash.</p> <p>Note: Before the address distribution information is saved, PC should enable the TFTP server and also PC and the DHCP server should connect correctly.</p>

(10) Configuring DHCP Database File Name

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd database-file <i>word</i> [time-stamp]</b>	<p>Configures the DHCP database file name, run the following command.</p> <p>Word means database file name</p> <p>Time-stamp means file name addition time stamp</p>

(11) Saving the Change of Cache Entry in Time to the Data Base File

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd database-realtime</b>	Saves the change of cache entry in time to the data base file, run the following command.

#### (12) Configuring DHCP Optional Server Host Name

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd server-name</b> <i>name</i>	Configures DHCP optional server host name.

#### (13) Enabling DHCP TFTP Server Name Option

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd sname-option</b>	Enables DHCP TFTP server name option.

#### (14) Configuring Relevant Parameters of DHCP Snooping

The command can be used to enable the ARP map protection. When this command is set, the DHCP server will establish an ARP map between the MAC address and distributed IP address of the DHCP client, and then protect this ARP map. Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd snooping arp</b>	Configures the parameters of DHCP snooping.

#### (15) Forwarding STB DHCP Data Packet

Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd relay-STB</b>	Enables STB DHCP data packet.

#### (16) Compulsorily Enabling DHCP TFTP Server Name Option and DHCP Enabling File Name Option

To compulsorily enable DHCP TFTP server name option (option:66) and DHCP enabling file name option (option: 67). Run the following command in the global configuration mode:

Command	Purpose
<b>ip dhcpd sname-bootfile-option-force</b>	Compulsorily enables DHCP TFTP server name option (option:66) and DHCP enabling file name option (option: 67).

#### (17) Configuring Address Pool of DHCP Server

To add the address pool of DHCP server, run the following command in global mode:

Command	Purpose
<b>ip dhcpd pool</b> <i>name</i>	Adds the address pool of DHCP server and enters the configuration mode of the DHCP address pool.

(18) Configuring Relevant Parameters for the Address Pool of DHCP Server

In the configuration mode of DHCP address pool, you can run the following commands to set related parameters.

To set the network address of the address pool of automatic distribution, run the following command:

Command	Purpose
<b>network</b> <i>ip-addr netsubnet</i>	Sets the network address of the address pool of automatic distribution.

To set the address range of automatic distribution, run the following command:

Command	Purpose
<b>range</b> <i>low-addr high-addr</i>	Sets the address range of automatic distribution.

To set the default route, which is distributed by the client, run the following command:

Command	Purpose
<b>default-router</b> <i>ip-addr ...</i>	Sets the default route that is distributed to the client.

To set the address of DNS server, which is distributed to the client, run the following command:

Command	Purpose
<b>dns-server</b> <i>ip-addr ...</i>	Sets the address of DNS server, which is distributed to the client.

To set a domain name, which is distributed to the client, run the following command:

Command	Purpose
---------	---------

<b>domain-name</b> <i>name</i>	Sets a domain name, which is distributed to the client.
--------------------------------	---

To set the time limitation of the address, which is distributed to the client, run the following command:

Command	Purpose
<b>lease</b> { <i>days</i> [ <i>hours</i> ][ <i>minutes</i> ]   <i>infinite</i> }	Sets the time limitation of the address, which is distributed to the client.

To set the address of the netbios name server, which is distributed to the client, run the following command:

Command	Purpose
<b>netbios-name-server</b> <i>ip-addr...</i>	Sets the address of the netbios name server, which is distributed to the client.

You can run the following command to reject to distribute the IP address to the host whose MAC address is hardware-address.

Command	Purpose
<b>hw-access deny</b> hardware-address	Reject to distribute IP addresses to the host whose MAC address is hardware-address.

#### (19) Monitoring DHCP Server

To browse the current address distribution information of DHCP server, run the following command in EXEC mode:

Command	Purpose
<b>show ip dhcpd binding</b>	Displays the current address distribution information of DHCP server.

To browse the current packet statistics of DHCP server, run the following command in EXEC mode:

Command	Purpose
<b>show ip dhcpd statistic</b>	Displays the current packet statistics of DHCP server.

To browse the current database server address of DHCP server, run the following command in EXEC mode:

Command	Purpose
<b>show ip dhcpd database-agent</b>	Displays the current address distribution information of DHCP server.

To check the current address pool information of DHCP Server, run the following command in EXEC mode.

Command	Purpose
<b>show ip dhcpd pool</b>	Displays the current address pool information of DHCP server.

#### (20) Clearing Information about DHCP Server

To delete the current address distribution information of DHCP server, run the following command in EXEC mode:

Command	Purpose
<b>clear ip dhcpd binding</b> <i>{{ip-addr}&amp;&lt;0-10&gt;/}</i>	Deletes the specified address distribution information.

To delete the current packet statistics of DHCP server, run the following command in EXEC mode:

Command	Purpose
<b>clear ip dhcpd statistic</b>	Deletes the current packet statistics of DHCP server.

To delete the current address which has abandoned or disabled by DHCP Server address pool, run the following command in EXEC mode.

Command	Purpose
<b>clear ip dhcpd abandoned</b>	Deletes the current address which has abandoned or disabled by DHCP Server address pool.

### 52.3.3 DHCP Server Configuration Example

In the following example, the timeout time of the ICMP detection packet is set to 200ms; Address pool 1 is configured and the DHCP server is enabled.

```
ip dhcpd ping timeout 2
```

```
ip dhcpd pool 1
```

```
network 192.168.20.0 255.255.255.0
range 192.168.20.211 192.168.20.215
domain-name my315
default-router 192.168.20.1
dns-server 192.168.1.3 61.2.2.10
netbios-name-server 192.168.20.1
lease 1 12 0
!
ip dhcpd enable
```

## 52.4 Configuring DHCP Relay

### 52.4.1 Configuration Task List of DHCP Relay

Enabling DHCP relay

Disabling DHCP relay

Setting the parameters of DHCP relay

### 52.4.2 DHCP Relay Configuration Tasks

#### (1) Enabling DHCP Relay

If you want to enable DHCP Relay on SWITCH, please enable DHCP server first. For details, please refer to section “Enabling the DHCP Server.”

#### (2) Disabling DHCP Relay

If you want to disable DHCP Relay on SWITCH, please disable the DHCP server first. For details, please refer to section “Disabling the DHCP Server.”

#### (3) Setting the Parameters of DHCP Relay

You can modify the destination address of DHCP relay according to requirements. The relay function of the DHCP packet is same in the mechanism of “Forwarding the UDP broadcast packet”. You can refer to the command, ip forward-protocol udp.

### 52.4.3 DHCP Relay Configuration Example

In the following example, the DHCP relay is enabled, the DHCP-request packet that is received from vlan 1 will be relayed to 10.1.1.1 and at the same time the DHCP-relay packet that arrives 192.168.20.1 will be retransmitted out from VLAN1.

```
interface vlan 1
 ip address 192.168.20.1 255.255.255.0
 ip help-address 10.1.1.1
!
ip dhcpd enable
```

# Chapter 53 Chapter 3 IP Service Configuration

The section is to describe how to configure optional IP service. For the details of the IP service commands, refer to section “IP Service Commands”.

## 53.1 Configuring IP Service

Optional IP service configuration tasks are listed as follows:

- Managing IP connection
- Configuring performance parameters
- Configuring default gateway
- Detecting and Maintaining IP Network

The above operations are not mandatory. You can perform the operations according to your requirements.

### 53.1.1 Managing IP Connection

The IP protocol provides a series of services to control and manage IP connections. Most of these services are provided by ICMP. The ICMP message is sent to the host or other routing SWITCH when the routing SWITCH or the access server detects faults in the IP message header. ICMP is mainly defined in RFC 792.

Perform the following different operations according to different IP connection conditions:

#### (1) Sending ICMP Unreachable Message

If the system receives a message and cannot send it to the destination, such as no routes, the system will send an ICMP-unreachable message to the source host. The function of the system is enabled by default.

If the function is disabled, you can run the following command in VLAN interface configuration mode to enable the function.

Command	Purpose
<b>ip unreachable</b>	Enable the function to send an ICMP-unreachable message.

#### (2) Sending ICMP Redirection Message

Sometimes the host selects an unfavorable route. After a routing SWITCH on the route receives a message from the host, it is to check the routing table and then forward the message through the message-receiving interface to another SWITCH that is in the same network segment as the host. In this case, the SWITCH notifies the source host of directly sending the message with the destination to another SWITCH without winding itself. The redirection message requires the source host to discard the original route and take more direct route suggested in the message. Many host’s operating system adds a host route to its routing table. However, the routing SWITCH is more willing to trust information obtained through the routing protocol. Therefore, the SWITCH will not add the host route according to the information.

The function is enabled by default. However, if a hot standby SWITCH protocol is configured on an interface, IPv6 redirection is automatically closed. If the hot standby SWITCH protocol is canceled, this function will not

automatically opened.

To enable the function, run the following command in VLAN interface configuration mode to forward ICMP re-directional packets:

Command	Purpose
<b>ip redirects</b>	Permit sending the ICMP redirection message.

#### (3) Sending ICMP Mask Response Message

Sometimes the host must know the network mask. To get the information, the host can send the ICMP mask request message. If the routing SWITCH can confirm the mask of the host, it will respond with the ICMP mask response message. By default, the routing SWITCH can send the ICMP mask response message.

To send the ICMP mask request message, run the following command in VLAN interface configuration mode:

Command	Purpose
<b>ip mask-reply</b>	Send the ICMP mask reply message.

#### (4) Supporting Route MTU Detection

The system supports the IP route MTU detection mechanism defined by RFC 1191. The IP route MTU detection mechanism enables the host to dynamically find and adjust to the maximum transmission unit (MTU) of different routes. Sometimes the routing SWITCH detects that the received IP message length is larger than the MTU set on the message forwarding interface. The IP message needs to be segmented, but the “unsegmented” bit of the IP message is reset. The message, therefore, cannot be segmented. The message has to be dropped. In this case, the routing SWITCH sends the ICMP message to notify the source host of the reason of failed forwarding, and the MTU on the forwarding interface. The source host then reduces the length of the message sent to the destination to adjust to the minimum MTU of the route.

If a link in the route is disconnected, the message is to take other routes. Its minimum MTU may be different from the original route. The routing SWITCH then notifies the source host of the MTU of the new route. The IP message should be packaged with the minimum MTU of the route as much as possible. In this way, the segmentation is avoided and fewer message is sent, improving the communication efficiency.

Relevant hosts must support the IP route MTU detection. They then can adjust the length of IP message according to the MTU value notified by the routing SWITCH, preventing segmentation during the forwarding process.

#### (5) Setting IP Maximum Transmission Unit (MTU)

All interfaces have a default IP maximum transmission unit (MTU), that is, the transmissible maximum IP message length. If the IP message length exceeds MTU, the routing SWITCH segments the message.

Changing the MTU value of the interface is to affect the IP MTU value. If IP MTU equals to MTU, IP MTU will automatically adjust itself to be the same as new MTU as MTU changes. The change of IP MTU, however, does not affect MTU. IP MTU cannot be bigger than MTU configured on the current interface. Only when all devices connecting the same physical media must have the same MTU protocol can normal communication be created.

To set IP MTU on special interface, run the following command in interface configuration mode:

Command	Purpose
<b>ip mtu bytes</b>	Sets IP MTU of the interface.

(6) Authorizing IP Source Route

The routing SWITCH checks the IP header of every message. The routing SWITCH supports the IP header options defined by RFC 791: strict source route, relax source route, record route and time stamp. If the SWITCH detects that an option is incorrectly selected, it will send message about the ICMP parameter problem to the source host and drop the message. If problems occur in the source route, the routing SWITCH will send ICMP unreachable message (source route fails) to the source host.

IP permits the source host to specify the route of the IP network for the message. The specified route is called as the source route. You can specify it by selecting the source route in the IP header option. The routing SWITCH has to forward the IP message according to the option, or drop the message according to security requirements. The routing SWITCH then sends ICMP unreachable message to the source host. SWITCH supports the source route by default.

If the IP source route is disabled, run the following command in global configuration mode to authorize the IP source route:

Command	Purpose
<b>ip source-route</b>	Authorizes IP source route.

(7) Allowing IP Fast Exchange

IP fast exchange uses the route cache to forward the IP message. Before the SWITCH forwards message to a certain destination, its system will check the routing table and then forward the message according to a route. The selected route will be stored in the routing cache of the system software. If latter message will be sent to the same host, the SWITCH will forward latter message according to the route stored in the routing cache. Each time message is forwarded, the value of hit times of the corresponding route item is increasing by 1. When the hit times is equal to the set value, the software routing cache will be stored in the hardware routing cache. The following message to the same host will be forwarded directly by the hardware. If the cache is not used for a period of time, it will be deleted. If the software/hardware cache items reach the upper limitation, new destination hosts are not stored in the cache any more. This SWITCH series can hold 2074 hardware cache items and 1024 software cache items.

To configure the hit times required when the software cache items are stored to the hardware cache, run the following command in global configuration.

Command	Purpose
<b>ip route-cache hit-numbers hitnumber</b>	When the hit times of the routing item in the software cache reaches the value of the parameter hitnumber, the routing item in the software cache will be stored as a

	routing item in the hardware cache.
--	-------------------------------------

The command can be enabled in global configuration mode. In case the next hop of the route of the indirectly connected host is same as that of a subnet route, the command will be used to decide whether to delete the hardware route of a host.

Command	Purpose
<b>ip route-cache age-exf</b>	Deletes the indirectly connected hardware route of a host whose next hop is the same with the hardware subnet route next hop.
<b>no ip route-cache age-exf</b>	Saves the indirectly connected hardware route of a host whose next hop is the same with the hardware subnet route next hop.

To set the delay of the route cache, which is caused by ARP change, run the following command in global mode:

Command	Purpose
<b>ip route-cache age-delay</b> <i>age-delay</i>	When arp changes, delete all hardware route cache in a delay (related to age-delay).

To set the lifetime of the entries in the software cache, run the following command in global mode:

Command	Purpose
<b>ip route-cache softcache-alive-time</b> <i>milliseconds</i>	Deletes the software route cache after milliseconds.

To set the operation time index of the software cache, run the following command in global mode:

Command	Purpose
<b>ip route-cache software-index</b> <i>ticks</i>	The bigger the ticks, the faster the SWITCH can age the invalid software route cache.

To set the operation time index of the hardware route cache, run the following command in global mode:

Command	Purpose
<b>ip route-cache hardware-index</b> <i>ticks</i>	The bigger the ticks, the faster the SWITCH can add the hardware route cache.

To set the lifetime of the hardware route cache, run the following command in global mode:

Command	Purpose
<b>ip route-cache-aging-time</b> <i>seconds</i>	Sets the lifetime of the SWITCH hardware route cache.

To enable the route cache add to the hardware table, run the following command in the global configuration mode:

Command	Purpose
<b>ip route-cache cache-pbr</b>	Adds the route cache which searches the route by the route policy to the hardware table.

#### (8) Supporting IP Fast Exchange on the Same Interface

You can enable the SWITCH to support IP fast exchange by making the receiving interface the same as the transmitting interface. Generally, it is recommended not to enable the function because it conflicts with the redirection function of the router.

Run the following command in the VLAN interface configuration mode to allow IP routing cache in the same interface:

Command	Purpose
<b>ip route-cache</b> <i>same-interface</i>	Allows IP message with the same receiving/transmitting interfaces to be stored in the routing cache.

## 53.1.2 Configuring Performance Parameters

Run the following command to adjust IP performance.

#### (1) Setting the Wait Time for TCP Connection

When the SWITCH triggers the TCP connection and if the TCP connection is not established in the designated wait time, the SWITCH views that the connection fails and then sends the result to the upper-layer program. The default value of the system is 75 seconds. The previous configuration has no impact on TCP connections that the SWITCH forwards. It only affects TCP connections that are created by the SWITCH itself.

Run the following command in global configuration mode to set the wait time for TCP connections:

Command	Purpose
<b>ip tcp synwait-time</b> <i>seconds</i>	Sets the wait time for TCP connection.

### (2) Setting the Size of TCP Windows

The default size of TCP windows is 2000 byte. Run the following command in global configuration mode to change the default window size:

Command	Purpose
<b>ip tcp window-size</b> <i>bytes</i>	Sets the size of TCP windows.

## 53.1.3 Detecting and Maintaining IP Network

To detect and maintain the network, run the following command:

### (1) Clearing Cache, List and Database

You can clear all content in a cache, list or database. All incorrect data in a cache, list or database need be cleared.

Run the following command to clear incorrect data:

Command	Purpose
<b>clear tcp statistics</b>	Clears the statistics data about TCP

### (2) Clearing TCP Connection

To disconnect a TCP connection, run the following command:

Command	Purpose
<b>clear tcp</b> { <i>local host-name port remote host-name port</i>   <b>tcb</b> <i>address</i> }	Clears the designated TCP connection. TCB refers to TCP control block.

### (3) Displaying Statistics Data about System and Network

The system can display the content in the cache, list and database. These statistics data can help you know the usage of systematic sources and solve network problems.

The command can be used in other modes except the user mode. For details, refer to “IP Service Command”.

Command	Purpose
<b>show ip access-lists</b> <i>name</i>	Displays the content of one or all access lists.
<b>show ip cache</b> [ <i>prefix mask</i>   <b>software</b>   <b>hardware</b>   <i>vlan number</i>   <b>summary</b> ]	Displays the routing cache that is used for fast IP message exchange.
<b>show ip sockets</b>	Displays all socket information of SWITCH.
<b>show ip traffic</b>	Displays IP protocol statistics data

<b>show tcp</b>	Displays all TCP connection status information
<b>show tcp brief</b>	Briefly displays information about TCP connection states.
<b>show tcp statistics</b>	Displays the statistics data about TCP
<b>show tcp tcb <i>address</i></b>	Displays information about the designated TCP connection state.

#### (4) Displaying Debug Information

When problem occurs on the network, you can run debug to display the debugging information.

Run the following command in EXEC mode. For details, refer to “IP Service Command”.

Command	Purpose
<b>debug arp</b>	Displays the interaction information about ARP.
<b>debug ip icmp</b>	Displays the interaction information about ICMP.
<b>debug ip raw</b>	Displays the information about received/transmitted Internet IP message.
<b>debug ip packet</b>	Displays the interaction information about IP.
<b>debug ip tcp packet</b>	Displays the interaction information about TCP.
<b>debug ip tcp transactions</b>	Displays the interaction information about TCP.
<b>debug ip udp</b>	Displays the interaction information about UDP.

## 53.2 Configuring Access List

### 53.2.1 Filtering IP Packet

Filtering message helps control the movement of packet in the network. The control can limit network transmission and network usage through a certain user or device. To make packets valid or invalid through the crossly designated interface, our routing SWITCH provides the access list. The access list can be used in the following modes:

- Controlling packet transmission on the interface
- Controlling virtual terminal line access
- Limiting route update content

The section describes how to create IP access lists and how to use them.

The IP access list is an orderly set of the permit/forbid conditions for applying IP addresses. The ROS software of our SWITCH tests the addresses one by one in ACL. The first match determines whether the ROS accepts or declines the address. After the first match, the ROS software terminates the match regulations. The order of the conditions is, therefore, important. If no regulations match, the address is declined.

Use the access list by following steps:

- (7) Create the access list by designating the access list name and conditions.
- (8) Apply the access list to the interface.

### 53.2.2 Creating Standard and Extensible IP Access List

Use a character string to create an IP access list.

Note:

The standard access list and the extensible access list cannot have the same name.

Run the following command in global configuration mode to create a standard access list:

Command	Purpose
<b>ip access-list standard</b> <i>name</i>	Use a name to define a standard access list.
<b>deny [reverse-mask] {source [source-mask]   any}[log][location]</b> or <b>permit [reverse-mask] {source [source-mask]   any}[log][location]</b>	Designate one or multiple permit/deny conditions in standard access list configuration mode. The previous setting decides whether the packet is approved or disapproved.
Exit	Log out from the access list configuration mode.

Run the following command in global configuration mode to create an extensible access list.

Command	Purpose
<b>ip access-list extended</b> <i>name</i>	Use a name to define an extensible IP access list.
<b>{deny permit} [reverse-mask] protocol source source-mask destination destination-mask [precedence precedence] [tos tos] [log] [offset-zero] [offset-not-zero] [time-range rangename] [totalen {eq   gt   lt} totalen] [ttl {eq   gt   lt} ttl] [donotfragment-set] [donotfragment-notset] [is-fragment] [not-fragment] [location][destinationrange][established]</b>	Designate one or multiple permit/deny conditions in extensible access list configuration mode. The previous setting decides whether the packet is approved or disapproved. precedence means the priority of the IP packet; TOS means Type of Service; offset-zero / offset-not-zero means whether IP packet Fragment offset is 0; is-fragment / not-fragment means whether IP packet is fragmented; donotfragment-notset / donotfragment-set means whether IP packet

	non-allowed is set; totalen means the total length of the packet; timer-rage means the time range of conditions being effective; ttl means IP packet Time To Live; dest-portrange means the range of destination port; established means established connection
Exit	Log out from the access list configuration mode.

After the access list is originally created, any part that is added later can be put at the end of the list. That is to say, you cannot add the command line to the designated access list. However, you can run no permit and no deny to delete items from the access list.

Note:

When you create the access list, the end of the access list includes the implicit deny sentence by default. If the mask is omitted in the relative IP host address access list, 255.255.255.255 is supposed to be the mask.

When ip acl is applied on the ONU interface, the device does not support configuration of larger, smaller and not equal to L4 port. In other words, L4 port can only be a fixed value.

After the access list is created, the access list must be applied on the route or interface. For details, refer to the following section “Applying the Access List to the Interface”.

### 53.2.3 Applying the Access List to the Routing Interface

After the access list is created, you can apply it to the routing interface including ingress and egress.

Run the following command in VLAN interface configuration mode.

Command	Purpose
<b>{ip ipv6} access-group name {in   out}</b>	Applies the access list to the interface.

The access control list can be used on the incoming or outgoing interface. After a packet is received, the source address of the packet will be checked according to the standard egress interface access control list. For the expanded access control list, the SWITCH also checks the objective address. If the access control list permits the destination address, the system will continue handling the packet. However, if the access control list forbids the destination address, the system will drop the packet and then returns an ICMP unreachable packet.

For the standard access list of the out interfaces, after a packet is received or routed to the control interface, the software checks the source address of the packet according to the access list. For the expanded access control list, the SWITCH will also check the access control list at the receiver terminal. If the access list permits the address, the software will send the packet. If the access list does not permit the address, the software drops the packet and returns an ICMP unreachable message.

If the designated access control list does not exist, all packets are allowed to pass through.

## 53.2.4 Applying the Access List to the Global Mode

After the access list is created, you can apply it to the routing interface in the global configuration mode including ingress and egress.

Run the following command in global mode:

Command	Purpose
<b>[no] {ip ipv6} access-group <i>name</i> [egress   vlan {word   add word   remove word}]</b>	Applies the established ip access list to an interface or cancels it on the interface in the global configuration mode. name Name of the IP access control list egress The access list is applied in egress. Vlan The access list is applied in ingress. Word vlan range table Add add vlan range table Remove delete vlan range table

If the designated access control list does not exist, all packets are allowed to pass through.

## 53.2.5 Applying the Access List to the Physical Interface

After the access list is created, you can apply it to the routing interface including ingress and egress.

Run the following command in physical interface configuration mode.

Command	Purpose
<b>[no] {ip ipv6} access-group <i>name</i> [egress]</b>	Applies the established ip access list to an interface or cancels it on the interface in the global configuration mode, run the following command: name Name of the IP access control list egress Applies access list on the egress direction. The default is the ingress direction.

If the designated access control list does not exist, all packets are allowed to pass through.

## 53.2.6 Extensible Access List Example

In the following example, the first line allows any new TCP to connect the destination port after port 1023. The

second line allows any new TCP to connect the SMTP port of host 130.2.1.2.

```
ip access-list extended aaa
permit tcp any 130.2.0.0 255.255.0.0 gt 1023
permit tcp any 130.2.1.2 255.255.255.255 eq 25
interface vlan 10
ip access-group aaa in
```

Another example to apply the extensible access list is given. Suppose a network connects the Internet, you expect any host in the Ethernet can create TCP connection with the host in the Internet. However, you expect the host in the Internet cannot create TCP connection with the host in the Ethernet unless it connects the SMTP port of the mail host.

SMTP connects with TCP port in one end and the arbitrary port number in the other end. During the connection period, the same two port numbers are used. The mail packet from the Internet has a destination port, that is, port 25. The outgoing packet has a contrary port number. In fact, the security system behind the routing SWITCH always receives mails from port 25. That is the exact reason why the incoming service and the outgoing service can be uniquely controlled. The access list can be configured as the outgoing service or the incoming service.

In the following example, the Ethernet is a B-type network with the address 130.20.0.0. The address of the mail host is 130.20.1.2. The keyword established is only used for the TCP protocol, meaning a connection is created. If TCP data has the ACK or RST digit to be set, the match occurs, meaning that the packet belongs to an existing connection.

```
ip access-list aaa
permit tcp any 130.20.0.0 255.255.0.0 established
permit tcp any 130.20.1.2 255.255.255.255 eq 25
interface vlan 10
ip access-group aaa in
```

# Chapter 54 Application of IP Access Control List

## 54.1 Applying the IP Access Control List

### 54.1.1 Applying ACL on Ports

After an ACL is established, it can be applied on one or many slots or globally.

Run the following command in global or port configuration mode:

Command	Purpose
<b>config</b>	Enters the global configuration mode.
<b>interface g0/1</b>	Enters the to-be-configured port.
<b>[no] {ip   ipv6} access-group name [egress   vlan {word   add word remove word}]</b>	<p>Applies the established IP/IPv6 access list to an interface or cancels it on the interface.</p> <p><b>Egress</b> means that the ACL is applied in an outbound direction.</p> <p><b>Vlan</b> means that the ACL is applied in an inbound VLAN.</p> <p><b>Word</b> stands for the VLAN range table.</p> <p><b>Add</b> means to add the VLAN range table.</p> <p><b>Remove</b> means to delete the VLAN range table.</p>
<b>exit</b>	Goes back to the global configuration mode.
<b>exit</b>	Goes back to the EXEC mode.
<b>write</b>	Saves the settings.

# Chapter 55 Routing Protocol overview

## 55.1 IP Routing Protocol

The router of the Company implements multiple IP dynamic routing protocol. They will be introduced in the description of each potocol in this Chapter.

IP routing protocols are classified into two categories: interior gateway router protocol (IGP) and exterior gateway router protocol (EGP). The routers of our Company support RIP, OSPF, BGP and BEIGRP. RIP、OSPF、BGP and BEIGRP can be configured separately on real needs. The router of our company supports simultaneous configuration of multiple routing protocol, including unlimited OSPF ( if memory is sufficient) processes, a BGP process, a RIP progress and unlimited BEIGRP processes. Command “redistribute” can be used to inject other router protocols into the database of current routing protocol so that the multiple routing protocols can be associated.

In order to configure IP dynamic routing protocol, the corresponding process shall be started and the corresponding network interfaces and the specific dynamic routing process should be associated, to indicate on which interfaces where the routing process run. To this end, the relevant steps for configuration shall be referred to in the corresponding document of configuration commands.

## 55.2 Choosing Routing Protocol

The choice of routing protocol is a complicated process. When choosing a routing protocol, the following factors shall be taken into account:

- The size and complexity of the network
- Whether the support for VLSM is needed
- Network traffic
- Security requirement
- Reliability requirement
- Policy
- Others

The subject will not be detailed here. It is noted that the chosen routing protocol shall meet the real condition of network and comply with your requirements.

### 55.2.1 Interior Gateway Router Protocol

Interior Gateway Routing Protocol is used for the network in a single autonomous system. All the IP interior gateway routing protocol shall be associated with some specific networks (such as configuring: *network*) when it is launched. Each routing process listens to update messages from other routers on the network and broadcasts its own routing information on the network at the same time. The inside gateway router protocol supported by the router of the Company includes:

- RIP
- OSPF

- BEIGRP

## **55.2.2 Exterior Gateway Routing Protocol**

Exterior gateway routing protocol is used for exchange routing information between different autonomous systems. It is usually required to configure the corresponding neighbors for exchanging routes, the reachable networks and local autonomous system number. The exterior gateway routing protocol supported by the router of our company is BGP.

# Chapter 56 Configuring VRF

## 56.1 Overview

One of the key of VPN is to keep safe and isolate data; it must be able to prevent communication of stations which belongs not to a same VPN. In order to differentiate VPN user route sent by which local interface on PE device, create virtual routes on PE device. Every virtual route has its own routing table and forwarding table. These routing tables and forwarding tables are called VRF(VPN Routing and Forwarding instances). One VRF includes the same station related routing table, interface (sub-interface), routing instances and routing policies. On PE, the physical port or the logic port with the same VPN corresponds to one VRF.

## 56.2 VRF Configuration Task List

If you would like to configure the VRF, the following tasks are necessary.

- 1) Creating VRF Table
- 2) Relating the interface to VRF
- 3) Configuring the Target VPN Expansion Attribute of VRF
- 4) Configuring Description of VRF
- 5) Configuring Static Route of VRF
- 6) Monitoring VRF
- 7) Maintaining VRF
- 8) Example of the VRF Configuration

## 56.3 Configuration Task

### 56.3.1 Creating VRF Table

To create VPN routing and forwarding table, do as follows in the global configuration mode:

Command	Purpose
PE_config# <b>ip vrf</b> ce	Enters VRF configuration mode, define VRF table.
PE_config_vrf_ce# <b>rd</b> ASN:nn or IP-address:nn	Designate the routing tag of VRF, create VRF routing and forwarding table
PE_config_vrf_ce# <b>route-target</b> [export   import   both ] ASN:nn or IP-address:nn	Create input of VRF and output target VPN expansion attribute

### 56.3.2 Relating the interface to VRF

Relate the interface to VRF, do as follows:

Command	Purpose
---------	---------

PE_config# <b>interface</b> <i>vlan 1</i>	Enters the interface configuration mode
PE_config_v1# <b>ip vrf forwarding</b> <i>vrf-name</i>	Relate the interface to VRF
PE_config_v1# <b>ip address</b> <i>ip-address</i> <i>subnet-mask</i>	Configures the IP address of the interface.

### 56.3.3 Configuring the Target VPN Expansion Attribute of VRF

To configure the target VPN expansion attribute of VRF, do as follows:

Command	Purpose
PE_config# <b>ip vrf</b> <i>ce</i>	Enters the configuration mode of VRF
PE_config_vrf_ce# <b>rd</b> <i>ASN:nn</i> or <i>IP-address:nn</i>	Configures VRF routing tag and creates VRF table.
PE_config_vrf_ce# <b>route-target</b> [ <b>export</b>   <b>import</b>   <b>both</b> ] <i>ASN:nn</i> or <i>IP-address:nn</i>	Configures input of VRF and output target expansion attribute.
PE_config_vrf_ce# <b>import map</b> <i>WORD</i>	Configures route-map filter of the route adding to VRF routing table.
PE_config_vrf_ce# <b>export map</b> <i>WORD</i>	Add target VPN expansion attribute complying with route-map condition to the output target VPN expansion attribute of VRF.

Before publish the local route to other PE routing device, the entrance PE will add a route target attribute to every route learned from the direct station. The target value affiliated to the route is based on the VRF value configured in the output target expansion attribute.

Before installing the remote route published by other PE on the local VRF, every VRF on the entrance PE route device will be configured with one input target expansion attribute. The PE routing device can only be installed on a certain VRF until the routing target attribute borne by VPN-IPv4 matching with the VRF input target.

### 56.3.4 Configuring Description of VRF

To configure the description of VRF, do as follows:

Command	Purpose
PE_config# <b>ip vrf</b> ce	Enters VRF configuration mode.
PE_config_vrf_ce# <b>rd</b> ASN:nn or IP-address:nn	Configures VRF routing tag, and creates VRF table.
PE_config_vrf_ce# <b>description</b> LINE	Configures description of VRF.

### 56.3.5 Configuring Static Route of VRF

To configure the static route of VRF, do as follows:

Command	Purpose
PE_config# <b>ip vrf</b> ce	Enters VRF configuration mode.
PE_config_vrf_ce# <b>rd</b> ASN:nn or IP-address:nn	Configures VRF routing tag and creates VRF table.
PE_config_vrf_ce# <b>exit</b>	Exits from VRF configuration mode.
PE_config# <b>ip route</b> [vrf vrf-name] dest mask { type num   nexthop } [distance]	Configures VRF static route.

### 56.3.6 Monitoring VRF

To monitor VRF, show the statistics of VRF. To monitor, do as follows:

Command	Purpose
PE# <b>show ip vrf</b>	Shows VRF and its associated port information.
PE# <b>show ip vrf</b> [{ <b>brief</b>   <b>detail</b>   <b>interfaces</b> }] vrf-name	Shows VRF configuration and its associated port information.
PE# <b>show ip route vrf</b> vrf-name[A.B.C.D   all   beigrp   bgp   ospf   rip   connect   static   summary ]	Shows the routing information in VRF routing table.

### 56.3.7 Maintaining VRF

Maintain VRF, track the main routing table and change of VRF routing table and VRF configuration information in the management mode and do as follows:

Command	Purpose
PE# <b>debug ip routing</b>	Track the addition, deletion and change of the route in the main routing table

PE #debug ip routing message	Track information VRF received and sent
PE #debug ip routing vrf vrf-name	Track the change of designated VRF routing table including adding, deleting and changing.

## 56.4 Example of the VRF Configuration

The configuration of the routing device is as follows:

Routing device CE:

```
interface loopback 0
```

```
ip address 22.1.1.1 255.255.255.0
```

```
!
```

```
interface vlan 1
```

```
ip address 170.168.20.152 255.255.255.0
```

```
!
```

```
router ospf 1
```

```
network 170.168.20.0 255.255.255.0 area 0
```

```
network 22.1.1.0 255.255.255.0 area 0
```

```
!
```

Routing device PE1:

```
ip vrf pe1

    rd 1:1

    route-target 1:1

!

interface vlan 1

    ip vrf forwarding pe1

    ip address 170.168.20.153 255.255.255.0

!

interface vlan 2

    ip address 176.168.20.152 255.255.255.0

!

router ospf 1 vrf pe1

    network 170.168.20.0 255.255.255.0 area 0

!

router bgp 1

    neighbor 176.168.20.154 remote-as 2

    address-family vpnv4

    neighbor 176.168.20.154 activate
```

```
exit-address-family
```

```
address-family ipv4 vrf pe1
```

```
no synchronization
```

```
redistribute ospf 1
```

```
exit-address-family
```

Routing device PE2:

```
ip vrf pe2
```

```
rd 1:1
```

```
route-target 1:1
```

```
!
```

```
interface loopback 0
```

```
ip vrf forwarding pe2
```

```
ip address 44.1.1.1 255.255.255.0
```

```
!
```

```
interface vlan 2
```

```

# Chapter 57 Static routing Configuration

## 57.1 Overview

The chapter illustrates how to configure the Static routing. If you would like to have the detailed description on the Static routing commands in this section, you can refer to the Chapter of " Static routing " in the "Reference for the Network Protocol Commands". If you would like to search the document with other commands, you can use the master index for commands and conduct inline search.

Static routing is a special routing configuration ,and is configured by an administrator. In the network structure is relatively simple network, you only need to configure static routes on network interoperability. Properly setting up and using static routes can improve network performance and be guaranteed bandwidth for important network applications.

The shortcomings of the static route is: It can not automatically adapt to changes in network topology. When network failure or topology change may be the route is unreachable, resulting in network outages, then you must manually by the network administrator to modify the configuration of static routes.

Default route in the router can not find a matching routing table entry when routing:

- If the packet's destination address can not be any entries in the routing table to match, the packet will select the default routing;
- If no default route and destination of the packet is not in the routing table, the packet will be discarded.

Network 0.0.0.0/0.0.0.0 in the form of default route through the static routing configuration, in order to appear in the routing table.

## 57.2 Static Routing Configuration Task List

If you would like to configure the static routing, the following tasks are necessary.

- configure the relevant physical parameters of the interface
- configure the link layer attributes of the related interface
- configure the IP address of the relevant interface

## 57.3 Static Routing Configuration Task

### 57.3.1 Configure the Static Routing

To activate the static routing, the following steps shall be carried out under the global configuration mode:

Command	Purpose
<code>ip route A.B.C.C mask {next-hop   interface}</code>	Configure the Static Routing

## 57.4 Example of the Static Routing Configuration

Assigned to the network segment 10.0.0.0/8 packets port is interface GigaEthernet3/0, the configuration is as follows:

```
ip route 10.0.0.0 255.0.0.0 gigaEthernet 3/0
```

# Chapter 58 Configuring RIP

## 58.1 Overview

The chapter illustrates how to configure the RIP. If you would like to have the detailed description on the RIP commands in this section, you can refer to the Chapter of "RIP Commands" in the "Reference for the Network Protocol Commands". If you would like to search the document with other commands, you can use the master index for commands and conduct inline search.

The Route Information Protocol (RIP) is a relatively old but still commonly used Interior Gateway Protocol (IGP), which is mainly used in the small-sized network of the same kind.. And RIP is a traditional Distance Vector Routing Protocol, which occurs in the RFC 1058.

RIP exchanges Routing Information through broadcasting UDP Packets. In the Router, the update Route Information will be sent every 30 seconds. In case that no update information from the neighbor router has been received within 180 seconds, the Routes from that neighboring router in the Routing Table will then be labeled as "Unusable". And if there is still no updated information received in the next 120 seconds, these Routes will be deleted from the Routing Table.

The Hop Count is taken by the RIP as a metric to measure different routes. And the Hop Count refers to the number of the passed routers of packets from the Source to the destination. The metric of the Route that is directly connected to the Network is "0", the metric of the Route whose network is not able to reach is "16". As the Route metric used by the RIP is in a relatively small range, it is not applicable to large-scale network. .

If a router has a default route, RIP then will advertises the route to the false Network of 0.0.0.0. In fact, the 0.0.0.0 network does not exist, which is only used for realizing the function of default route in RIP.. If the RIP has learned a default route, or the default gateway is configured in router and configured with default metric, the router will then announce the default network.

The RIP will send the updates to the interface of the appointed network. If the network of the very interface is not appointed, the network then will not be announced in any RIP updating. .

The RIP-2 of our company's router supports Plaintext and MD5 Authentication, Route Summary, CIDR and VLSM.

## 58.2 RIP Configuration Task List

If you would like to configure the RIP, the following tasks are necessary. While you have to first activate the RIP, the other tasks are optional.

- Starting the RIP
- Enabling Unicasting of RIP route update messages.
- Applying the offset on the route metric
- Regulating the Timer
- Designating the RIP Version Number
- Activating the RIP Authentication
- Prohibitting Route summary
- Prohibitting the Authentication on Source IP Address

- Activating or Prohibit the split-horizon

## 58.3 RIP Configuration Task

### 58.3.1 Starting the RIP

To activate the RIP, the following steps shall be carried out under the global configuration mode:

Command	Purpose
<b>router rip</b>	Activate the RIP Routing Process and enter the router configuration mode.
<b>network network-number &lt;network-mask&gt;</b>	Appoint the Network Number relevant to the RIP Routing Process

### 58.3.2 Allowing the mono-broadcasting updated and grouped by RIP Router

The RIP is a broadcasting-Type Protocol. If you would like the updating of routes to access to the non-broadcasting type network, the router shall be configured so as to enable information exchange. To this end, the following commands shall be used under router configuration mode:

Command	Purpose
<b>neighbor ip-address</b>	Define a neighbor router to exchange with it the Routing Information.

In addition, if you would like to control which interface(s) that can be used to exchange routing information, the command "ip rip passive" can be used to designate an interface or some interfaces prohibiting the sending of the update of routes. If necessary, please refer to the relevant discussion on the route filtration in the "Filtering the Routing Information" in the Chapter of "Protocol-Independent Commands in Configuring IP Router".

### 58.3.3 Using the Offsets on the Route metric

Offset List is taken to increase an offset on the Input and Output Routes, which have been learned with the RIP. On the other hand, you can use the Access List or the interface to limit the Offset List. In order to increase the Route metric, the following commands should be executed in the router configuration mode:

Command	Purpose
<b>offset-list {[interface-type number]}* {in out} access-list-name offset</b>	Increase an offset on the route metric.

### 58.3.4 Regulating the Timer

Routing protocols use several timers to determine the frequency for sending the updating of routes, how long the router will become invalid and other parameters. You can regulate these timers so as to make the performance of the Routing Protocols more suitable to the requirements of the network.

It is also possible to regulate the Route Protocol to accelerate the Convergence Time of all kinds of the IP Routing computation, to quickly backup to the redundant router so as to minimize the time of quick recovery. To regulate the Timer, the following commands should be used under router configuration model.

Command	Purpose
<b>timers holddown</b> <i>value</i>	Regulating the time (Unit: Second) it take to delete certain route from the Routing Table
<b>timers expire</b> <i>value</i>	Regulating the time (Unit: Second) that the router is announced to be invalid.
<b>timers update</b> <i>value</i>	Regulating the frequency for sending the updating of the Router (the time interval between sedning of the updating of routing, (unit: Second)

### 58.3.5 Appointing the RIP Version Number

The RIP-2 of our company's router supports Authentication, Password Management, Route summary, CIDR and VLSM.

Under the default circumstance, the router can receive the updates of RIPv1 and RIPv2, while it can only send the updates of RIP-1. By configuration, the router can be set to receive and send the updates of RIPv1 only, or receive and send the updates of RIPv2 only. For this purpose, the following commands should be taken in the router configuration mode:

Command	Purpose
<b>version</b> {1   2}	Configure the router to send and receive the updates of RIPv1 or RIPv2 only.

The above tasks are controlling the default behavior of the RIP. And you can also configure a certain interface to change this default behavior. In order to control the interface to send the RIP-1 updates or the RIP-2 updates, the following commands shall be used under interface configuration mode.

Command	Purpose
<b>ip rip send version 1</b>	Configure the interface to send the updates of RIP-1 only.
<b>ip rip send version 2</b>	Configure the interface to send the updates of RIP-2 only.
<b>ip rip send version compatibility</b>	Send by broadcasting t the Updating of RIP-2.message.

At the same time, to control the interface to receive the updates of RIP-1 and RIP-2, the following commands shall be used under the interface configuration mode:

Command	Purpose
<b>ip rip receive version 1</b>	Configure the interface to receive the updates of RIP-1 only.
<b>ip rip receive version 2</b>	Configure the interface to receive the updates of RIP-2 only.
<b>ip rip receive version 1 2</b>	Configure the interface to receive the updates of RIP-1 and RIP-2 only.

### 58.3.6 Enabling the RIP Authentication

RIP-1 does not support Authentication. If you would like to send and receive the updates of RIP-2, you can activate the function of RIP Authentication on the interface.

On the activated interface of RIP, we support 2 kinds of Authentication Modes: Plaintext Authentication and MD5 Authentication. the Plaintext authentication is used in each subgroups of BIP-2 under default status.

**Notes:**

Regarding the safety, please don't use Plaintext Authentication in the groups of RIP, because the unencrypted authentication key would be sent to each update of the RIP-2. If the safety is not a big question, (in case that it is guaranteed that the wrongly configured host can not take part in the route) the Plaintext Authentication can be used.

To configure the RIP Plaintext Authentication, the following steps should be taken under interface configuration mode:

Command	Purpose
<b>ip rip authentication simple</b>	Activate the RIP Authentication.
<b>ip rip password</b> <i>[string]</i>	Configure the Plaintext Authentication key for the interface.

In order to configure the MD5 Authentication, the steps below should be taken under interface configuration mode:

Command	Purpose
<b>ip rip authentication</b> <i>message-digest</i>	Activate the RIP MD5 Authentication
<b>ip rip message-digest-key</b> <i>[key-ID] md5</i> <i>[key]</i>	Configure the MD5 Authentication key for the interface

### 58.3.7 Activating the 'Passive' and 'Deaf' of the Interface

By default the interface covered by RIP can forward and receive the routing update by flexibly applying the RIP protocol.

To configure the passive and deaf status of the interface in the interface configuration mode:

Command	Purpose
<b>ip rip passive</b>	The interface will not forward the rip protocol grouping.
<b>ip rip deaf</b>	The interface does not receive rip protocol grouping.

### 58.3.8 Activating RIP Authentication

RIP-1 does not support authentication. If the grouping of RIP-2 is forwarding and receiving, the RIP authentication can be activated on the interface.

Multiple authentication modes are supported on RIP activated interface: plaintext authentication, MD5 authentication, dynamic authentication (md5 and sha1). Each RIP-2 grouping uses plaintext authentication by default.

**Note:**

If considering safety, do not use the plaintext authentication in RIP grouping, this is because the authentication key without encryption is forwarded to each RIP-2 grouping. If safety is not considered (for instance, the host with error configuration cannot participate in the route), the plaintext authentication is available.

To configure RIP plaintext authentication, do as follows in the interface configuration mode:

Command	Purpose
<b>ip rip authentication simple</b>	Configures the interface with the plaintext authentication.
<b>ip rip password <i>string</i></b>	Configures the plaintext authentication key.

To configure MD5 authentication of RIP, do as follows in the interface configuration mode:

Command	Purpose
<b>ip rip authentication md5</b>	Configures the interface with MD5 authentication.
<b>ip rip md5-key <i>key-ID md5 key</i></b>	Configures MD5 authentication key and authentication ID.

To configure the dynamic authentication of RIP, do as follows in the interface configuration mode:

Command	Purpose
<b>ip rip authentication dynamic</b>	Configures the interface with dynamic authentication (md5 and sha1).
<b>ip rip dynamic-key <i>key-ID { md5   sha1 } key xxxx-xx-xx-xx:xx xx:xx</i></b>	Configures dynamic authentication key and authentication ID.

After configuring the RIP authentication configuration, do as follows in the interface configuration mode:

Command	Purpose
<b>ip rip authentication commit</b>	If the authentication cannot pass, age the opposite end peer and the route learned from the opposite end.

### 58.3.9 Prohibiting the Route summary

Under the default circumstance, the RIP-2 supports the automatic route summary, summarizing the RIP-2 Routes when crossing the boundary of the classified network. And the RIP-1 Automatic Route Gathering Function is always activated.

If there is a separated Sub-net, it is necessary to prohibit the Route summary to declare this Sub-net. If the Route Gathering is prohibited, when crossing the boundary of the classified network, the router will then send the route information of the sub-net and the host. Under the router configuration mode, the following command should be taken to prohibit the automatic gathering.

Command	Purpose
<b>no auto-summary</b>	Prohibit the Automatic summary

### 58.3.10 Prohibiting the Authentication of Source IP Address

Under the default circumstance, the router will authenticate the Authenticable Source IP Address of the received route update. If this address is illegal, the router update will then be rejected.

If you have a router in hope to receive the updating from it, but you have not configured the corresponding "network" or "neighbor" on the receiver, the function should be therefore prohibited. However in the common practice, this command is not recommended to use. Under router configuration mode, the following commands

will prohibit the default function of authenticating the source IP address in incoming route updates.

Command	Purpose
<b>no validate-update-source</b>	Prohibit to authenticate the Source IP Address of the incoming RIP Router Updating.

### 58.3.11 Maximum Number of Routes

By default, the local RIP routing table can contain up to 1024 routes. When the number of routes in the routing table exceeds the maximum number, the route will not be added to the routing table any more. Meanwhile, the user will be notified that the number of routes in the routing table has reached the maximum number. Run the commands in the following table to configure the maximum number of the routes in the local RIP routing table in router configuration mode.

Command	Purpose
<b>maximum-count</b> <i>number</i>	Configures the maximum number of routes for the local RIP routing table.
<b>no maximum-count</b>	Resumes the default maximum number of the routes in the local RIP routing table.

### 58.3.12 Activating or Prohibit the Horizontal Split

Normally, the router, which is connected with IP Network and using the Distance Vector Routing Protocol, takes split-horizon to lower the possibility of route loops. The Split-Horizon prevents the announcements of route information to the receiving interface of this route information. In this way, communication within several routers (especially when the loop breaks) will be optimized. However, to Non-broadcasting Network (such as FR), things are not so easy. And maybe you have to prohibit the Horizontal Split.

If an interface has been configured with a supplementary IP Address and the Horizontal Split has been activated, the update-Source IP Address of the route update may not include every secondary IP address. The source IP address of one route update includes only one Network Number (unless the split-horizon is Prohibited).

In order to activate or prohibit the Horizontal Split, the following commands should be taken under interface configuration mode:

Command	Purpose
<b>ip rip split-horizon</b>	Activate the Split- Horizon
<b>no ip rip split-horizon</b>	Prohibit the Split- Horizon

Under the default circumstance, for the point to Point Interface, the Split-Horizon is activated; For Point-to multiple point Interface, the Split-Horizon is prohibited.

Please refer to the specific example of using Split-Horizon in the "Examples of Split-Horizon" in Section of this Chapter.

**Notes:**

Commonly, it is suggested that the default state remain unchanged unless you are sure that your application can't declare the route correctly until you change its state. Always remember: if the Split-Horizon is prohibited

on a serial interface (and the interface is connected with a Packet-switched Network), you have to prohibit Split-Horizon to all routers in any relevant Multicast Group on that Network.

### 58.3.13 Monitoring and Maintenance of RIP

With the RIP monitored and maintained, the Network Statistics can be displayed, such as: RIP protocol Parameter Configuration, Network utilization, Real-time Tracing of Network Communication and so on. Such information can help you judge the use of Network Resource and further solve the network problems and know the reachability of network nodes .

The following commands can be used to display the statistics information of all kinds of routes under management statistics:

Command	Purpose
<b>show ip rip</b>	Display the present Status of RIP
<b>show ip rip database</b>	Display all routes of RIP
<b>Show ip rip protocol</b>	Display all the relevant information of RIP Protocol

Under the management mode, the following commands shall be used to trace route protocol information.

Command	Purpose
<b>Debug ip rip database</b>	Trace the procedure information of RIP Routing such as Insertion into the Routing Table, Deletion from the Routing Table, Changes of Routes and so on.
<b>Debug ip rip protocol</b>	Trace the RIP protocol messages.

### 58.4 Example of the RIP Configuration

Examples of the RIP Configuration is included in this section:

## RouterA

```
interface ethernet 1/1
ip address 192.168.20.81 255.255.255.0
!
interface loopback 0
ip address 10.1.1.1 255.0.0.0
!
router rip
  network 192.168.20.0
  network 10.0.0.0
!
```

## RouterB

```
interface ethernet 1/1
ip address 192.168.20.82 255.255.255.0
interface loopback 0
ip address 20.1.1.1 255.0.0.0
!
router rip
  network 192.168.20.0
  network 20.0.0.0
!
```

# Chapter 59 BEIGRP Configuration

This chapter will detail the configuration process of BEIGRP dynamic routing protocol.

## 59.1 Overview

Brief introduction of BEIGRP routing protocol.

The technology used by BEIGRP is similar to distance vector routing protocol:

- The router only makes routing decisions with the information provided by directly connected neighbours;
- The router only provides the routing information it uses to the directly connected neighbors. But, BEIGRP has some main differences with distance vector routing protocol, which entitles it to have more advantages:
- BEIGRP saves all routes from all neighbours in the topology table, not just the best routes so far;
- BEIGRP can make query to the neighbors when it is unable to access the destination and no alternative routes are available, so, the convergence speed of BEIGRP can compete with the best link-state protocol.

The introduction of DUAL----Diffused Update Algorithm is vital for BEIGRP's superiority to other traditional distance vector routing protocol. It always works actively and queries the neighbours when it is unable to access the destination and there is no alternative routes (feasible replacement). As the convergence process is active rather than negative (negatively waiting for the timeout of the routers), so the convergence speed of BEIGRP is very quick.

BEIGRP is a specific routing protocol designed to adapt to the requirements of EIGRP and is directly based on IP. It meets the following requirements of BEIGRP:

- Dynamically discover new neighbor and the disappearance of old neighbors through "Hello" message;
- So the transfer of data are all reliable;
- The transfer protocol permits unicast and multicast data transfer;
- The transfer protocol itself can adapt to the change of network condition and neighbor responding;
- BEIGRP can limit the percentage of its occupation of the bandwidth according to the requirements

## 59.2 BEIGRP Configuration Task List

To complete the configuration of BEIGRP the following tasks are required to be done, among them, the activation of BEIGRP is necessary while others can be decided according to the requirement.

- Activate BEIGRP protocol
- Configure the sharable percentage of bandwidth
- Adjust the arithmetic coefficient of BEIGRP composite distance
- Using "offset" to adjust the composite distance of the router
- Turn off auto-summary
- Customize route summary
- Configure other parameters of BEIGRP

- The supervision and maintenance of BEIGRP

## 59.2.1 Activating BEIGRP Protocol

In order to create a BEIGRP process, it is required to execute the following commands:

Command	Purpose
<b>router beigrp</b> <i>as-number</i>	Add a BEIGRP process under global configuration mode
<b>network</b> <i>network-number</i> <i>network-mask</i>	Add addresses to this BEIGRP process under router configuration mode

After finishing the above configuration, BEIGRP will start to run on all interfaces belonging to this address, discovers new neighbours through “Hello” and carries out initial routing interaction through “update”.

## 59.2.2 Configuring the Sharable Percentage of Bandwidth

Under default circumstances, BEIGRP can occupy 50% of the bandwidth at most. You may wish to change this default value in order to guarantee the normal interaction of other data, or wishes to adjust the actually usable bandwidth of BEIGRP through the command when the interface is configured with a bandwidth not fit for actual situation. Under these conditions, you can use the following commands under interface configuration mode:

Command	Purpose
<b>ip beigrp bandwidth-percent</b> <i>percent</i>	Configure the maximum percentage of BEIGRP messages' occupation of the bandwidth

## 59.2.3 Adjusting the Arithmetic Coefficient of BEIGRP Composite Distance

Under certain situations, the arithmetic co-efficient of BEIGRP composite distance may need to be adjusted, and finally influences the routing policy of the router. Although the default arithmetic co-efficient of BEIGRP can satisfy most networks, but it may still need to be adjusted under some particular conditions. But this adjust may bring great change to the whole network, so it must be performed by the most experienced engineers.

Use the following command under router configuration mode:

Command	Purpose
<b>metric weights</b> <i>k1 k2 k3 k4 k5</i>	Adjust the arithmetic co-efficient of BEIGRP composite distance.

## 59.2.4 Using “Offset” to Adjust the Composite Distance of the Router

We use offset list to purposely add all incoming and outgoing routes according to the requirement, or the composite distance of certain routes meeting the requirements. The aim of this approach is to finally influence the routing result of the router, and meets our expected result. During the process of configuration, the user can designate access list or application interface in the offset list selectively and according to your requirements, in order to more clearly notify which routes to carry out operations to increase offset. Looking at the following command:

Command	Purpose
---------	---------

<b>offset</b> {type number   *} {in   out} access-list-name offset	Apply an offset list.
---	-----------------------

## 59.2.5 Turning off Auto-Summary

The auto-summary of BEIGRP is different with other dynamic routing protocols, and it obeys the following rules:

- When a BEIGRP process defines several networks, as long as there is at least one sub-net of this networks exists in the BEIGRP topology list, it creates the summary route of the defined network.
- The established summary route points to interface Null0, and has the distance as the minimum distance of all the sub-nets of the network included in the route. The summary route is also injected into the main IP routing table with the management distance of 5 (unable to be configured)
- When sending update to the neighbors in different main IP network, the sub-nets summarized by rule1 and rule 2 is cancelled and only a summary route will be sent.
- Do not perform summary towards the sub-nets of any networks not listed in BEIGRP process definition.

Under certain network situations, you may wish to report every detailed route to the neighbor, and you may use the following commands:

Command	Purpose
<b>no auto-summary</b>	Turn off auto-summary of the route.

## 59.2.6 Customizing Route Summary

When auto-summary cannot meet the requirements, you may configure route summary on each interface running BEIGRP and designate the destination addresses that need performing summary. The interfaces configured for summary will not send the concrete update information of the sub -nets belonging this summary address, while other interfaces are not affected.

Here, the summary operation follows the following rules:

- After an interface is configured for summary, it creates the summary route of the defined network as long as this network has at least one sub-net in BEIGRP topology list;
- The summary route points to interface Null0, and has the distance as the minimum distance of all the sub-nets of the network included in the route. The summary route is also injected into the main IP routing table with the management distance of 5 (unable to be configured)
- When sending route update on the interface configured with summary range, the concrete route belonging to the summary address will be canceled. The update to other interfaces are not affected.

Command	Purpose
<b>ip beigrp</b> <i>summary-address as-number address mask</i>	Configure route summary on an interface.

## 59.2.7 Redistributing Other Routes into the BEIGRP Process

The **redistribute** operation follows the below rules:

- It isn't have to configure the command "default-metric" when redistribute the static routes and the connected routes. The related parameter(such as: bandwidth, delay, reliability , load and MTU ) is attained from the related interface.
- It isn't necessary to configure the command "default-metric" when redistribute the routes of other beigrp process. The related parameter is attained from the BEIGRP process redistributed.
- It is necessary to configure the command "default-metric" when redistribute the routes of others protocol (such as: rip, ospf). The related parameter is validated by the configuration of "default-metric". If we redistribute the routes of these types without the command "default-metric", the redistribution doesn't work.

In a router running the BEIGRP protocol and the RIP protocol, the following commands must be configured when we need obtain the routes from RIP protocol to BEIGRP protocol.

Command	Purpose
<b>default-metric</b> bandwidth delay reliability loading mtu	configure the default parameter of redistribute
<b>redistribute</b> protocol [process] [ <b>route-map</b> name]	redistribute the routes to BEIGRP protocol.

## 59.2.8 Configuring Other Parameters of BEIGRP

In order to adapt to different network environments, and to make BEIGRP be more effectively and fully functions, we may need to adjust the following parameters:

- Adjust the time interval of BEIGRP to send "hello" messages and the timeout death time of the neighbours
- Turn off split-horizon

## Adjusting the time interval of BEIGRP to send "hello" messages and the timeout death time of the neighbors

BEIGRP hello protocol achieves 3 objectives to enable correct BEIGRP operation:

- It discovers accessible new neighbors. The discovery is automatic and requires no manual configuration;
- It checks neighbors' configuration and only permits communication with the neighbours configured with compatible mode.
- It continues to maintain the availability of the neighbors and detects the disappearance of the neighbors.

The router sends "hello" multicast packet on all interfaces running BEIGRP. All routers support BEIGRP receive these multicast groups, so that it can discover all neighbours.

"Hello" protocol uses two timers to detect the disappearance of the neighbours: hello interval defines the frequency of sending BEIGRP hello messages on the interface of the router, while hold timer defines the interval of time the router has to wait for the communication data from the designated neighbor before the declaration of the neighbour's death. We ordered that every time it receives BEIGRP packet from the neighbour router, it resets the hold timer.

Different network type or network bandwidth will use different default value of hello timer:

Interface type encapsulation		Hello timer (second)	Hold timer (second)
WAN inte rfac e	Any	5	15
	HDLC or PPP	5	15
	NBMA interface, bandwidth<=T1	60	180
	NBMA interface, bandwidth>T1	5	15
	The point-to-point sub- interface of NBMA interface	5	15

The difference of the default value of the timer in Hello protocol may induce the result that the BEIGRP neighbours connected to different IP sub-network use different hello and hold timer. To resolve the problem, the hello packet of every router designates its own hold timer, every BEIGRP router uses neighbour's the designated hold timer of the hello group to decide the timeout of this neighbour. Here, it can enable the appearance of different neighbour error detection timers in the different stands of the same WAN nephogram. But under some particular situation, the default value of the timer cannot be met, so if you want to adjust the time interval of sending hello messages, use the following command:

Command	Purpose
<b>ip beigrp hello-interval</b> <i>seconds</i>	Adjust the time interval of sending hello message from this interface

If you wish to adjust the timeout timer of the neighbour, use the following command:

<b>Command</b>	<b>Purpose</b>
<b>ip beigrp hold-time</b> <i>seconds</i>	Adjust the timeout death time of the neighbor

## Shutting down the horizon split

Commonly, we wish to use split-horizon. It will prevent the routing information from one interface to be broadcasted back to the same interface, so as to avoid route loop. But under certain circumstances, this is not the optimized choice, and then we can use the following command to disable split-horizon:

Command	Purpose
<code>no ip beigrp split-horizon</code>	Turn off horizontal split

### 59.2.9 Monitoring and Maintaining BEIGRP

To clear the neighbourship with all neighbours, use the following command:

Command	Purpose
<code>clear ip beigrp neighbors [as-number   interface]</code>	To clear the neighborship with all neighbours

In order to show various statistics information of BEIGRP, execute the following commands:

Command	Purpose
<code>show ip beigrp interfaces [interface] [as-number]</code>	show interface information
<code>show ip beigrp neighbors [as-number   interface]</code>	show neighbor information
<code>show ip beigrp topology [as-number   all-link   summary   active]</code>	show topology information

### 59.3 Examples of BEIGRP configuration

In the following example, the interface ethernet1/1 is configured to send a summary route to address 10.0.0.0/8, and all subnets routes belonging to this address will not be advertised to the neighbors from the interface.

Meanwhile, we turn off the auto-summary of BEIGRP process.

```
interface Ethernet 1/1
ip beigrp summary-address 1 10.0.0.0 255.0.0.0
!
router beigrp 1
network 172.16.0.0 255.255.0.0
no auto-summary
```

# Chapter 60 Configuring OSPF

## 60.1 Overview

The OSPF Configuration will be introduced in this chapter. For more specific detailed information about all the OSPF commands, please refer to the relevant sections about OSPF Commanders in the Reference for Network Protocol Configuration.

OSPF is an IGP Route protocol developed by the OSPF Working Group of IETF. The OSPF, which is designed for the IP Network, supports the IP Sub-network and the External Route Information Label and at the same time allows the authentication of message and supports the IP Multicast.

The Implementation of OSPF of our company complies with the OSPF V2 specification (Refers to RFC2328). Some key features in the implementation are listed in the following:

- Stub Area--Supporting the Stub Area
- Route redistribution--Any route, formed by and learned a routing protocol, can always be redistributed to the other route protocol Domain. Within the autonomous System, it means that OSPF can input the route learned by the RIP. And the routes learned by OSPF can also be redistributed to the RIP. Between autonomous Systems, OSPF can input the routes learned by BGP; and OSPF routes can also be injected to BGP.
- Authentication--The Plaintext and MD5 Authentications are supported between the neighboring routers within a area.
- Router Interface Parameters--The configurable Parameters include: Outgoing Cost, Retransmission Interval, Interface Transmission Delay, router Priority, Judgement on the router Switching-off Interval, the Interval of Hello Message and the Authentication Password.
- Virtue Link--Supporting the Virtue Link
- NSSA area--Refer to RFC 1587
- OSPF---RFC 1793 on the virtual circuit.

## 60.2 OSPF Configuration Test List

OSPF requires to exchange routing data among all routers, ABR and ASBR in a area. In order to simplify the configuration, you may let them all work under default parameters without authentication, etc... but if you want to alter some parameters, you should guarantee the identity of the parameters on all routers.

In order to configure OSPF complete the following tasks. Besides the necessity of activating OSPF, other configurations are all optional.

- Start OSPF
- Configure the interface parameter of OSPF
- OSPF configuration on different physical networks
- Configure route summary within OSPF domain
- Configure the gathering of a forward router
- Create default route
- Select router ID through LOOPBACK interface
- Configure the management distance of OSPF
- Configure the route calculating timer

- The supervision and maintenance of OSPF

In addition to that, about configuring route redistribution, please refer to the related content about “Route Redistribution” of “Protocol-independent Feather Configurations of IP routing Protocol”.

## 60.3 OSPF Configuration Tast

### 60.3.1 Starting OSPF

Like other routing protocols, activating OSPF demands creating OSPF routing process, allocation of an IP address range related to the executing process, allocation of an area ID related to IP address range. Under the global configuration mode, use the following commands:

Command	Purpose
<b>router ospf</b> <i>process-id</i>	This command activates OSPF routing protocol, and enters router configuration mode.
<b>network</b> <i>address mask area area-id</i>	This command configures the interface(s) running OSPF and the area ID of the interface

### 60.3.2 Configuring the Interface Parameter of OSPF

During the implementation of OSPF, it is permitted to change the OSPF parameters related to interface according to the requirement. There is no need to change any parameter, but you should guarantee the identity of certain parameters on all routers on connected network.

Under interface configuration mode, use the following commands to configure interface parameters:

Command	Purpose
<b>ip ospf cost</b> <i>cost</i>	Configure the metric of OSPF interface to forward packets.
<b>ip ospf retransmit-interval</b> <i>seconds</i>	The seconds taken to retransmit LSA between the neighbors belonging to the same OSPF interface.
<b>ip ospf transmit-delay</b> <i>seconds</i>	Configure the estimated time to transmit LSA on an OSPF interface (second as the unit).
<b>ip ospf priority</b> <i>number</i>	Configure the priority of router to become the DR router
<b>ip ospf hello-interval</b> <i>seconds</i>	Configure the time interval to send hello packet on OSPF interface.
<b>ip ospf dead-interval</b> <i>seconds</i>	If the router does not receive “hello” packet from the neighbor within the time interval defined, it considers the neighbor router to be turned off.
<b>ip ospf authentication-key</b> <i>key</i>	It is an authentication password of the adjacent router in an address, which uses simple password authentication of OSPF.
<b>ip ospf message-digest-key</b> <i>keyid md5 key</i>	Demand OSPF to use MD5 authentication.
<b>ip ospf passive</b>	Do not send “hello” message on the interface.

### 60.3.3 Configuring OSPF Network Type

No matter what the physical media type of the network is, you can configure your network to be broadcasting network or non-broadcasting, multi-access network. Using this feature, you can flexibly configure the network,

you can configure the physical broadcasting network to be a non-broadcasting, multi-access network; you can also configure non-broadcasting network (X.25, Frame Relay, and SMDS) to be broadcasting network. This feature also reduces the configuration of the neighbors, for detailed information, please refer to the related content of non-broadcasting network's configuration of OSPF.

Configure non-broadcasting, multi-access network to be broadcasting network or non-broadcasting network, that is, to suppose there exists virtual links from every router to other routers, or suppose they consist of a full-mesh network. Because of the restriction of expenses, it is usually not practical; or a partially full-mesh network. Under this situation, you can configure a point-to-multiple point network. Routers not adjacent to each other can exchange routing information through virtual links.

OSPF point-to-multiple point interface can be defined as several point-to-point network interfaces, which creates multiple host routes. OSPF point-to-multiple point network has the following advantages over non-broadcasting, multi-access network and point-to-point network:

Point-to-multiple point network is easy to configure, it does not demand neighbor configuration command, it only uses one IP and will not produce DR.

Because it does not need to full-mesh network topology, it costs less.

It is more reliable. Even when virtual links fail, it can still maintain the connection.

Under interface configuration mode, configure OSPF network type with the following command:

Command	Purpose
<code>ip ospf network {broadcast   non-broadcast   {point-to-multipoint [non-broadcast]}}</code>	This command configures the network type of OSPF.

At the end of this chapter, you can see an example of the configuration of OSPF point-to-multiple point network.

### 60.3.4 Configuring One-to-Multiple Broadcast Network

You do not need to describe the neighbor relations in point-to-multiple point network and broadcasting network. But you can use command "neighbor" to describe the priority of a certain neighbor.

Before using this command, some OSPF point-to-multiple point protocol traffic is multicast traffic. So for point-to-multiple point interface, command "neighbor" is not needed. Packet "hello", update packet and confirmation packet are all transmitted through broadcasting form, especially, multicast "hello" packet can dynamically discover all neighbors.

In point-to-multiple point network, the router supposes that all neighbors have the same metric. This value can be configured through command "ip ospf cost". In fact, the bandwidth of every neighbor is different, so the value should be different. This feature only applies to point-to-multiple point interface.

Using the following command to configure the interface to be point-to-multipoint interface and allocate a metric for each neighbor:

Command	Purpose
<code>ip ospf network point-to-multipoint</code>	On broadcasting media, configure the interface to be a point-to-multiple point network
<code>Exit</code>	Return to global configuration mode

<b>router ospf</b> <i>process-id</i>	Configure an OSPF router process and enter into router configuration mode.
<b>neighbor</b> <i>ip-address cost number</i>	Designate a neighbor and allocate a metric for it

For each neighbor wishing to designate its metric, repeat step 4. Otherwise use the value designated by command “ip ospf cost”.

### 60.3.5 Configuring Non-Broadcasting Network

Because there are many routers in the OSPF network, so there must be one DR elected for the network. If the broadcasting ability is not configured, it is requested to perform parameter configuration for the selection process.

These parameters only carry out configuration on the routers that are eligible to become DR or BDR.

Under router configuration mode, use the following command to configure routers of non-broadcasting network which are mutually related:

Command	Purpose
<b>neighbor</b> <i>ip-address [priority number] [poll-interval seconds]</i>	Configure the router connected to the non-broadcasting network

You can designate the following parameters for a neighbor router:

- The precedence of neighbor router.
- Non-broadcasting poll interval.
- Interface accessible to the neighbor

In point to multiple point, non-broadcasting network, you can use command “neighbor” to designate neighbor relation. Allocate an optional priority.

In the previous software versions, some users configure point to multipoint connections on non-broadcasting media (IP over ATM), so the router cannot dynamically discover its neighbor router. This feature permits the usage of command “neighbor” on point to multipoint interface.

In a point to multipoint network, the router supposes all neighbors have the same metric. This value can be configured through the command “ip ospf cost”. In fact, as the bandwidth of each neighbor is different, the value should also be different. This feature only applies to point to multiple point interfaces.

Under interface configuration mode, use the following command to configure point to multiple point interfaces on media that do not support broadcasting.

Command	Purpose
<b>ip ospf network point-to-multipoint non-broadcast</b>	Configure point to multiple point interface on non-broadcasting media
<b>exit</b>	Enter into global configuration mode.
<b>router ospf</b> <i>process-id</i>	Create a OSPF routing process and enter into router configuration mode
<b>neighbor</b> <i>ip-address [cost number]</i>	Designate an OSPF neighbor and allocate a metric for it

Repeat step 4 for each neighbor.

## 60.3.6 Configure OSPF domain

Configurable area parameters include: authentication, designating Stub area, designating metric for default summary route. Authentication adopts protection based on passwords.

Stub areas are those that don't distribute external routes in them. Instead, ABR generates a default external route to enter the stub area, enable it to enter the external network of the autonomous system. In order to utilize the features OSPF Stub support, you should use default route in the Stub area. In order to additionally reduce LSA number sent into the Stub area, you can prohibit gathering ABR to reduce the sending of summary LSA (type3) entered into the Stub area.

Under router configuration mode, use the following command to define the area parameter:

Command	Purpose
<b>area area-id authentication simple</b>	Activates OSPF area authentication
<b>area area-id authentication message-digest</b>	Enables OSPF to use MD5 for authentication
<b>area area-id stub [no-summary]</b>	Defines a Stub area
<b>area area-id default-cost cost</b>	Sets metric for default route in Stub area.

## 60.3.7 Configuring the NSSA Area of OSPF

The NSSA area is similar to the STUB area. However, the NSSA area allows external routes to be entered. The route summary and packet filtration are also supported during transmission. If ISP requires to use the remote network with different routing protocols, the NSSA can simplify management.

The enterprise-core boundary router cannot run in the STUB area of OSPF if NSSA is not applied. That's because the routes of the remote network cannot be forwarded to the STUB area. The simple routing protocols such as RIP can be advertised, but two kinds of routing protocols need be maintained. NSSA can put the center router and the remote router in the same NSSA area and OSPF thus be applied to the remote network. When the NSSA area is used, note that the route generated by the ABR router can enter the NSSA area once NSSA is configured. Each router in the same area must admit that they are in the NSSA area, or different routers cannot communicate with each other. The displayed release must be used on ABR to avoid packet transmission confusement of the router.

Run the following command in router configuration mode to set the NSSA area of OSPF:

Command	Purpose
<b>Area area-id nssa [no-redistribution][no-summary][default-information-originate]</b>	Configures the OSPF NSSA area.

## 60.3.8 Configuring Route Summary Within OSPF Domain

This feature enables ABR to broadcast a summary route to other areas. In OSPF, ABR will broadcast every network to other areas. If the network number can be allocated according to a certain method, and be continuous, you can configure ABR to broadcast a summary route to other areas. A summary route can cover all networks within a certain range.

Under router configuration mode, use the following commands to define the address ranges:

Command	Purpose
<b>area</b> <i>area-id range address mask</i>	Define the address range for route summary.

### 60.3.9 Configuring the Gathering of a Forwarding Router

When distributing routes from other router areas to OSPF router area, each performs independent broadcasting in the form of external LSA. But you can configure the router to broadcast a route, which covers a certain address range. This method can reduce the size of OSPF link status database.

Under the router configuration mode, use the following command to configure gathering the router:

Command	Purpose
<b>summary-address</b> <i>prefix mask [not advertise]</i>	Describe the address and mask that cover the distribution route, only one gathering route is broadcasted.

### 60.3.10 Creating Default Route

You can demand ASBR to create a default route to enter into the OSPF route area. Whenever you configure a router distribute route to enter into OSPF domain, this router automatically changes into ASBR. But, ASBR does not create default route entering into OSPF route area by default.

Under router configuration mode, use the following command to force ASBR to create a default route:

Command	Purpose
<b>default-information originate</b> [ <i>always</i> ] [ <i>route-map map-name</i> ]	Force ASBR to create a default route entering into OSPF route area.

### 60.3.11 Selecting Router ID Through Loopback Interface

OSPF uses the biggest IP address configured on the interface as its router ID. If the interface connected to this IP address changes into DOWN state, or this IP address is deleted, OSPF process will restart to calculate new router ID and resend routing information from all interfaces.

If one loopback interface is configured with IP address, then the router uses that IP address as its router ID, since loopback interface will never become Down, and all these make the routing table more stable.

The router preferably uses LOOPBACK interface as the router ID, meanwhile selects the biggest IP address among all loopback interfaces as the router ID. If there is no loopback interface, then uses the biggest IP address of the router. You cannot designate OSPF to use any special interface.

Under global mode, use the following command, to configure IP Loopback interface.

Command	Purpose
<b>interface loopback 0</b>	Create a loopback interface and enter into interface configuration mode.
<b>ip address</b> <i>ip-address mask</i>	Allocate an IP address for the interface.

### 60.3.12 Configuring the Management Distance of OSPF

Management distance is defined as the reliability level of routing information source, such as a router or a

group of routers. Generally speaking, management distance is an integer between 0-255, the higher the value is, the lower the reliability level it is. If the management distance is 255, then the route information source will not be trusted and should be neglected.

OSPF uses 3 different types of management distances: inter-domain, inner-domain and exterior. The route within an area is inner-domain; the route to other areas is inter-domain; the route distributed from other route protocol domains is exterior. The default value of every kind of route is 110.

Under router configuration mode, use the following command to configure the distance value of OSPF:

Command	Purpose
<b>distance ospf</b> [ <i>intra-area dist1</i> ] [ <i>inter-area dist2</i> ] [ <i>external dist3</i> ]	Change the management distance value of OSPF inner-domain, inter-domain and exterior route.

### 60.3.13 Configuring the Route Calculation Timer

You can configure the time delay between the time when OSPF receives topologic change information and when it starts to calculate SPF. You can also configure the interval between two consecutive calculations of SPF. Under router configuration mode, use the following command to configure:

Command	Purpose
<b>timers delay</b> <i>delaytime</i>	Set the time delay in the route calculation in a area.
<b>timers hold</b> <i>holdtime</i>	Set the minimum time interval of route calculation in a area.

### 60.3.14 Configuring the On-Demand Link

OSPF over on-demand circuits is an upgrade of OSPF, which enables the protocol more efficient in case of on-demand dialing network surfing. The OSPF protocol is to regularly exchange the HELLO packets and the link-state broadcast-refresh packets among the connected routers after the connection is first established or the information contained in the packet is changed, which means that the minimum spanning tree will be recalculated and the packet will be transmitted only when the topology is really changed.

If the point-to-point connection is among the routers, the configuration should be conducted on one terminal. Of course, the router on the other terminal must support this trait. If the point-to-multipoint connection is among the routers, the configuration must be conducted on the multipoint terminal.

It is recommended to configure the on-demand dialing in the STUB area. If this attribute is configured on each router in the STUB area, the routers outside the STUB area are allowed not to support the on-demand dialing. If on-demand dialinh is configured in a standard area, other standard areas must support this trait, because the second kind of external link-state broadcast packets will be broadcast in all areas.

When the trait is configured on the broadcast-based network, the link-state broadcast packets can be restraint, while the HELLO packets cannot be restraint. That's because the HELLO packets are used to maintain the neighborhood relation and to select DR.

Run the following command in interface mode:

Command	Purpose
---------	---------

ip ospf demand-circuit	Configures OSPF on-demand dialing.
------------------------	------------------------------------

### 60.3.15 Monitoring and Maintaining OSPF

It can display the statistic information of the network, such as: the statistics about the content of IP routing Table, cache and database and etc... This information can help you to judge the utilization of the network resource, and solve the network problem. You can understand the availability of the network nodes, discover the route the network data packet goes through the network.

Use the following commands to display various routing statistics:

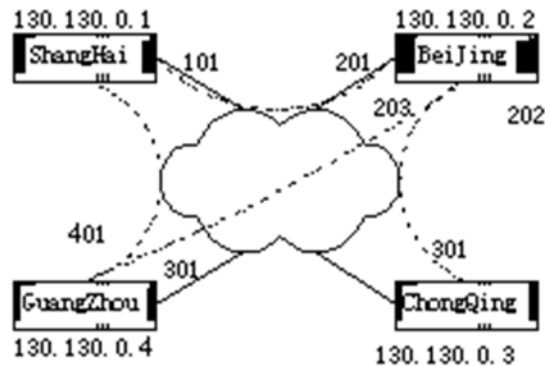

Command	Purpose
<b>show ip ospf</b> [ <i>process-id</i> ]	Display the general information about OSPF routing process.
<b>show ip ospf</b> <i>process-id</i> [ <b>database</b> [ <b>router network summary asbr-summary external database-summary</b> ]][ <i>link-state-id</i> ][ <b>self-originate</b> ]	Display the related information about OSPF database.
<b>show ip ospf border-routers</b>	Display the internal routing table entry of ABR and ASBR.
<b>show ip ospf interface</b>	Display the information about OSPF interface.
<b>show ip ospf neighbor</b>	Display the OSPF neighbor information according to the interface.
<b>debug ip ospf adj</b>	Supervise the adjacency establishment of OSPF.
<b>debug ip ospf events</b>	Supervise the interface and neighbour events of OSPF.
<b>debug ip ospf flood</b>	Supervise the flooding process of OSPF database.
<b>debug ip ospf lsa-generation</b>	Supervise the LSA generation of OSPF.
<b>debug ip ospf packet</b>	Supervise the message of OSPF.
<b>debug ip ospf retransmission</b>	Supervise the message retransmission process of OSPF.
<b>debug ip ospf spf</b> [ <b>intra  external</b> ]	Supervise the SPF calculation route of OSPF.
<b>debug ip ospf tree</b>	Supervise the establishment of SPF tree of OSPF

## 60.4 Examples of OSPF Configuration

Here are the examples of OSPF configuration:

### 60.4.1 Examples of OSPF one-to-multi Point Configuration

Beijing uses DLCI201 to communicate with Shanghai, DLCI202 to communicate with Jelly, and DLCI203 with Platty. Neon uses DLCI101 to communicate with Mollie and DLCI102with Platty. Platty can communicate with Neon (via DLCI 401) and Mollie (via DLCI 402). Jelly can communicate with Mollie via DLCI301.

### The configuration of BEIJING:

```

Hostname Beijing
!
interface serial 1/0
ip address 130.130.0.2 255.255.0.0
encapsulation frame-relay
frame-relay map 130.130.0.1 pvc 201 broadcast
frame-relay map 130.130.0.3 pvc 202 broadcast
frame-relay map 130.130.0.4 pvc 203 broadcast
ip ospf network point-to-multipoint
!
router ospf 1
network 130.130.0.0 255.255.0.0 area 0

```

### The configuration of ShangHai:

```

hostname shanghai
!
interface serial 1/0
ip address 130.130.0.1 255.0.0.0
encapsulation frame-relay
frame-relay map 130.130.0.2 pvc 101 broadcast
frame-relay map 130.130.0.4 pvc 102 broadcast
ip ospf network point-to-multipoint
!
router ospf 1
network 130.130.0.0 255.255.0.0 area 0

```

### The configuration of GuangZhou:

```

hostname guangzhou
!
interface serial 1/0
ip address 130.130.0.4 255.0.0.0
encapsulation frame-relay
physical speed 1000000
frame-relay map 130.130.0.1 pvc 401 broadcast
frame-relay map 130.130.0.2 pvc 402 broadcast
ip ospf network point-to-multipoint
!

```

```
router ospf 1
network 130.130.0.0 255.255.0.0 area 0
```

The configuration of ChongQing:

```
hostname chongqing
!
interface serial 1/1
ip address 130.130.0.3 255.0.0.0
encapsulation frame-relay
physical speed 2000000
frame-relay map 130.130.0.2 pvc 301 broadcast
ip ospf network point-to-multipoint
!
router ospf 1
network 130.130.0.0 255.255.0.0 area 0
```

## 60.4.2 Examples of OSPF point to multipoints, non-broadcasting configuration

```
interface Serial1/0
ip address 10.0.1.1 255.255.255.0
ip ospf network point-to-multipoint non-broadcast
encapsulation frame-relay
frame-relay local-dlci 200
frame-relay map 10.0.1.3 pvc 202
frame-relay map 10.0.1.4 pvc 203
frame-relay map 10.0.1.5 pvc 204
no shut
!
router ospf 1
network 10.0.1.0 0.0.0.255 area 0
neighbor 10.0.1.3 cost 5
neighbor 10.0.1.4 cost 10
neighbor 10.0.1.5 cost 15
```

Here is the configuration of the router on the other side:

```
interface Serial1/2
ip address 10.0.1.3 255.255.255.0
encapsulation frame-relay
ip ospf network point-to-multipoint non-broadcast
no ip mroute-cache
no keepalive
no fair-queue
frame-relay local-dlci 301
frame-relay map 10.0.1.1 pvc 300
no shut
!
router ospf 1
network 10.0.1.0 0.0.0.255 area 0
```

## 60.4.3 Examples of the configuration of variable length sub-network masks

OSPF, static routing supports variable length sub-network masks (VLSMs). Through VLSMs, it can use different masks to the same network number on different interfaces, this saves IP addresses, and can more

efficiently utilize the address space of the network.

In the following example, it only uses 30bit sub-network masks and reserves address space of 2 bit as the host address for the serial ports. For point-to-point serial link, which only requires two host addresses, it is enough.

```
interface ethernet 1/0
ip address 131.107.1.1 255.255.255.0
! 8 bits of host address space reserved for ethernet
interface serial 1/1
ip address 131.107.254.1 255.255.255.252
! 2 bits of address space reserved for serial lines
! Router is configured for OSPF and assigned AS 107
router ospf 107
! Specifies network directly connected to the router
network 131.107.0.0 0.0.255.255 area 0.0.0.0
```

## 60.4.4 Examples of the configuration of OSPF route and route distribution

OSPF requires exchanging information among many internal routers, ABRs and ASBRs. Under minimum configuration, the routers based on OSPF can work under default parameters and have no requirement of authentication.

Here are three examples of configuration:

The first example practices the basic OSPF command.

The second example configures the configuration of internal router, ABR and ASBR in a single OSPF autonomous system.

The third example illustrates a more complex example of configuration with various OSPF tools.

## An example of basic OSPF configuration

The following example illustrates a simple OSPF configuration. Activate routing process 90 , then connect the Ethernet interface 0 to area 0.0.0.0. Meanwhile, redistribute RIP to OSPF, OSPF to RIP.

```
interface ethernet 1/0
  ip address 130.130.1.1 255.255.255.0
  ip ospf cost 1
!
interface ethernet 1/0
  ip address 130.130.1.1 255.255.255.0
!
router ospf 90
  network 130.130.0.0 255.255.0.0 area 0
  redistribute rip
!
router rip
  network 130.130.0.0
  redistribute ospf 90
```

## An example of the basic configuration of inner router, ABR and ASBR

The following example allocates 4 areas ID for 4 IP address range. Firstly, routing process 109 is activated, the 4 areas are: 10.9.5.0, 2, 3, 0. The masks of area 10.9.50.0,2,3 designate the address range, but area 0 includes all the networks.

```
router ospf 109
  network 131.108.20.0 255.255.255.0 area 10.9.50.0
  network 131.108.0.0 255.255.0.0 area 2
  network 131.109.10.0 255.255.255.0 area 3
  network 0.0.0.0 0.0.0.0 area 0
!
! Interface Ethernet1/0 is in area 10.9.50.0:
interface ethernet 1/0
  ip address 131.108.20.5 255.255.255.0
!
! Interface Ethernet1/1 is in area 2:
interface ethernet 1/1
  ip address 131.108.1.5 255.255.255.0
!
! Interface Ethernet1/2 is in area 2:
interface ethernet 1/2
  ip address 131.108.2.5 255.255.255.0
!
! Interface Ethernet1/3 is in area 3:
interface ethernet 1/3
  ip address 131.109.10.5 255.255.255.0
!
! Interface Ethernet1/4 is in area 0:
interface ethernet 1/4
  ip address 131.109.1.1 255.255.255.0
!
! Interface FastEthernet0/0 is in area 0:
interface FastEthernet0/0
  ip address 10.1.0.1 255.255.0.0
```

The functions of network area configuration command are ordinal, so the order of the commands is important. The router matches the address/mask pair of each interface in order. For detailed information, please refer to the related content in the reference of related network protocol command in “OSPF command”.

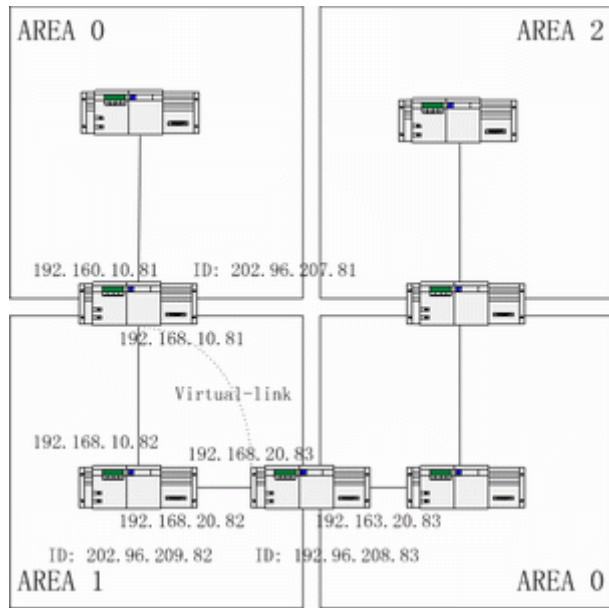

Let's return to the first network area in the above example. The area ID 10.9.50.0 is configured with an interface sub-network mask as 131.108.20.0. So Ethernet interface 0 matches. So Ethernet interface 0 only exists in area 10.0.50.0.

Then come to the second area. Except interface 0, apply the same process on other interfaces, then Ethernet interface 1 matches. So interface 1 connects to area2.

Continue the matching of other network areas. NOTICE that the last network area command is a special case, which means that the rest interfaces are all connected to network area 0.

An example of the complex configuration of interior router, ABR and ASBR.

The following example illustrates the configuration of several routers in a single OSPF autonomous system. Figure 24 is the network topology of the example:

(8) Configure the router according to the above Figure:

**RouterA:**

```
interface loopback 0/0
ip address 202.96.207.81 255.255.255.0
!
interface Ethernet 1/0
ip address 192.168.10.81 255.255.255.0
!
interface ethernet 1/0
ip address 192.160.10.81 255.255.255.0
!
router ospf 192
network 192.168.10.0 255.255.255.0 area 1
network 192.160.10.0 255.255.255.0 area 0
!
```

**RouterB:**

```
interface loopback 0/0
ip address 202.96.209.82 255.255.255.252
!
interface Ethernet 1/0
ip address 192.168.10.82 255.255.255.0
!
interface ethernet 1/1
ip address 192.160.20.82 255.255.255.0
!
router ospf 192
network 192.168.20.0 255.255.255.0 area 1
network 192.168.10.0 255.255.255.0 area 1
!
```

**routerC:**

```
interface loopback 0/0
ip address 202.96.208.83 255.255.255.252
!
interface Ethernet 1/0
```

```
ip address 192.163.20.83 255.255.255.0
!  
interface ethernet 1/1  
ip address 192.160.20.83 255.255.255.0  
!  
router ospf 192  
network 192.168.20.0 255.255.255.0 area 1  
network 192.163.20.0 255.255.255.0 area 0  
!
```

## Configuration examples for complicated internal router, ABR and ASBR

The following example shows how to configure multiple routers in a single OSPF autonomous system. Figure 4-2 shows the network topology of the configuration example:

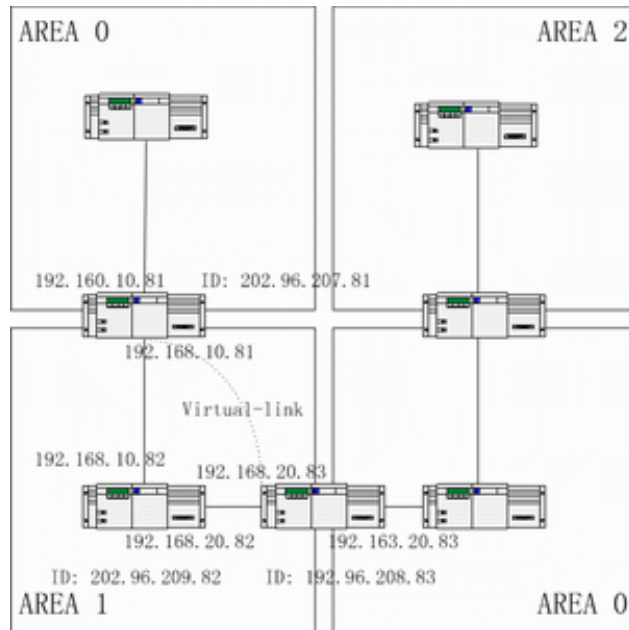

Figure 4-2 Network topology of the configuration example

Configure the router according to Figure 4-2:

Router A:

```
interface loopback 0/0
ip address 202.96.207.81 255.255.255.0
!
interface Ethernet 1/0

# Chapter 61 Configure BGP

## 61.1 Overview

This chapter describes how to configure border gateway protocol (BGP). For complete description about BGP commands in this chapter, please refer to other sections related to “BGP command”. BGP is an Exterior Gateway Protocol (EGP) defined in RFC1163, 1267 and 1771. It permits to establish a route selection mechanism among different autonomous systems, this mechanism can automatically guarantee the loop-free routing information exchange between the autonomous systems.

### 61.1.1 The BGP implementation of the router

In BGP, each route includes a network number, the autonomous system list this route has traverse (called As-path) and other attribute lists. Our router software supports BGP v4 defined in RFC1771. The basic function of BGP is to exchange network reachability information with other BGP systems, including information about AS-path information. This information can be used to construct the AS connection graph which can eliminate route loop, and it can implement AS level routing policy with AS connection graph. BGP v4 supports classless inter-domain router (CIDR), CIDR can reduce the size of the routing table through creating summary routes and thus creates a super network. CIDR removes the concept of network level in BGP, and supports IP prefix broadcasting. CIDR route can be transferred through OSPF, Enhanced IGRP, ISIS-IP and RIP2.

An important difference between exterior gateway routing and interior gateway router is the former has better controllability. In order to control the route, the implementation of BGP provides several optional methods:

- In order to filter routes, it can be based on access-list based on neighbour, aspath-list, prefix-list and also use the access-list based on interface, prefix-list to filter routes or the Nexthop attribute of the routes.
- In order to change the attribute of the routes, you can use the route-map to mend the attributes of BGP routes including MED, Local preference, route value and etc...
- In order to interact with the interior gateway dynamic routing protocol (OSPF, RIP, etc...), you can redistribute route, so as to automatically generate BGP routing information. You can also generate BGP routes through manual configuration of network, aggregation. While generating BGP routes, you can use route-map to configure the attributes of the routes.
- In order to control the precedence of BGP routes in the system, you can use command “distance” to configure the management distance of BGP routes.

### 61.1.2 How does BGP select the path

The decision process of BGP is established on the basis of comparing route attribute value. When the same network has several routes, BGP selects the best route to the destination. The following process summarizes how BGP selects the best route:

- If it cannot arrive at the next hop, it will not be considered.
- If the path is internal and the synchronization is activated, and if the route is not in IGP, the route will not be considered.
- Select preferable path with the maximum precedence.

- If each route has the same value, preferably select the route with the maximum local precedence.
- If each route has the same local precedence, select preferably the route generated by local router. For example, route may be generated by local router through the using of command “network, aggregate” or by redistributing IGP route.
- If the local precedences are the same, or if there is no route generated by local router, then select preferably the route with the shortest AS path.
- If the AS path lengths are the same, then select preferably the route with the lowest attribute value of “origin” (IGP<EGP<IMCOMPLETE)
- If the attribute values of “Origin” are the same, then select preferable route with the lowest MED value. Unless “bgp always-compare-med” is activated, this comparable can only be carried out between the routes from the same neighbour AS.
- If each route has the same MED, select preferable external path (EBGP) rather than internal path (IBGP). All paths inside the autonomous system confederation are considered to be internal paths, but select preferably EBGP confederation not IBGP confederation.
- If each route has the same connection attribute, select preferable route with a smaller router-id.

## 61.2 BGP Configuration Task List

### 61.2.1 Basic configuration task list of BGP

The configuration tasks of BGP can be divided into basic tasks and advanced tasks. The first two entries of basic tasks are necessary to configure BGP, other entries in basic tasks and all advanced tasks are optional.

The basic configuration tasks of BGP include:

- Activate the route selection of BGP.
- Configure BGP neighbor.
- Configure BGP soft reconfiguration
- Reset BGP connection.
- Configure the synchronization between BGP and IGPs
- Configure BGP route value
- Configure BGP route filter based on the neighbour
- Configure BGP route filtration based on the interface
- Disable the nexthop treatment of BGP update

### 61.2.2 Advanced BGP configuration tasks list

Advanced, optional BGP configuration tasks are listed as the following:

- Use route-map to filter and modify route update
- Configure aggregate address
- Configure BGP community attribute
- Configure autonomous system confederation
- Configure route reflector
- Shut down peer entity
- Configure multihop external peer body
- Configure the management distance of BGP routes
- Adjust BGP timer.

- Compare MED of routes from different AS.

For more related information about the configuration of the attributes of several IP route selection protocols, please refer to “The configuration of attributes of IP routing which are independent from the protocol”.

## 61.3 Configure basic BGP features

### 61.3.1 Configuring Basic BGP Features

#### 1. Activate the route selection of BGP

In order to activate BGP route selection, use the following commands under global configuration mode to activate BGP route selection:

Command	Purpose
<b>router bgp autonomous-system</b>	Under router configuration mode, activate BGP route selection process.
<b>network network-number/masklen [route-map route-map-name]</b>	Tag the network as local autonomous system and add it to the BGP list.

#### Notes:

For exterior gateway routing protocol, the using of configuration command “network ” to configure an IP network canand to only control which networks will be informed. This is opposite to interior gateway protocol (IGP), such as RIP, it is using command “network” to decide where to send the update.

Command “network” is used to import IGP routes to BGP routing table. Router resource, such as configured RAM, decides the upper limit of the usable command “network”. As a choice, you can use command “redistribute” to achieve the same effect.

#### 2. Configure BGP neighbour

To configure BGP neighbour is to establish the peer to exchange routing information. BGP neighbour ought to be configured in order to exchange routing information with the outer world.

BGP supports two kinds of neighbours: internal neighbour (IBGP) and external neighbour (EBGP). Internal neighbours are in the same AS; external neighbours are in different ASs. Normally, external neighbours are adjacent to each other and share the same sub-network. But internal neighbours can be at any place in the same AS.

Use configuration command “Neighbor” to configure BGP neighbour:

Command	Purpose
<b>neighbor {ip-address   peer-group-name} remote-as number</b>	Designate a BGP neighbour.

For example about the configuration of the BGP neighbor, please refer to the section in the bottom of this chapter “an example of the configuration of the BGP neighbor”.

#### 3. Configure BGP soft reconfiguration

Generally speaking, BGP neighbors only exchange all routes when the connections are established, after that, they only exchange update routes. So if the configured routing policy gently changes, in order to apply it on the received routes, it is necessary to clear BGP session. The clearing of BGP session will cause the invalidation of cache and will exert great influence on the operation of the network. Soft reconfiguration function enables the configuration and activation of policy without clearing BGP session. So, we recommend you to

use soft reconfiguration, currently, we enable the soft reconfiguration based on each neighbour. When the soft reconfiguration is used on the incoming update produced by the neighbor, it is called incoming soft reconfiguration; When the soft reconfiguration is used on the outgoing update to the neighbor, it is called outgoing soft reconfiguration. Applying incoming soft reconfiguration can make the new input policy effective, Applying outgoing soft reconfiguration makes new local output policy effective without the reset of BGP session.

In order to generate new incoming update without resetting of BGP session, local BGP speaker should save the received incoming update without any modification, regardless whether it would be accepted or denied under current incoming policy. This will be very memory consuming and should be avoided. On the other hand, outgoing reconfiguration does not have any extra memory consumption, so it is always effective. You can trigger outgoing soft reconfiguration on the other side of BGP session to make the new local incoming policy effective.

In order to permit incoming soft reconfiguration, you should configure the BGP to save all accepted routing update. Outgoing reconfiguration need not be pre-configured.

Use the following router configuration command to configure BGP soft reconfiguration:

Command	Purpose
<b>Neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>soft-reconfiguration</b> [ <i>inbound</i> ]	Configure BGP soft reconfiguration

If you use parameter “**peer-community-name**” to designate BGP peer community, all peer community members in it will inherit the feature of this command.

#### 4. Reset BGP connection

Once two routers are defined as BGP neighbours, they create a BGP connection, and exchange routing information. If the BGP routing policy has been changed, or other configurations have been changed, then you should reset the BGP connection in order to make the change of configuration effective. Use one of the following two management mode commands to reset BGP connection:

Command	Purpose
<b>clear ip bgp</b> { <i>*</i>   <i>address</i> }	Reset all BGP connections. Recreate a special BGP connection.

#### 5. Configure the synchronization between BGP and IGP

If you permit another AS to transfer data to the third AS through your AS, then the synchronization between your AS internal routing state and the routing information it broadcasted to another ASs is very important. For example, if your BGP wants to broadcast routes before all routers in your AS get to know the routes through IGP, then your AS may receive some information that some routers cannot route. In order to prevent these situations, BGP should wait until all IGP routers inside AS get to know that routing information, this is the synchronization between BGP and IGP, and the synchronization is activated by default.

Under certain situations, it is not necessary to synchronize. If you do not permit other ASs to transfer data through your AS, or if all routers in your AS will run BGP, your can cancel the Synchronization function. Cancelling that feature will enable you to put fewer routes in your IGP, and enable quicker convergence of BGP. Use the following router configuration command to cancel synchronization:

Command	Purpose
<b>no synchronization</b>	Cancel the synchronization between BGP and IGP.

While canceling synchronization, you should use command “clear ip bgp” to clear BGP dialogue.

For an example about BGP synchronization, please refer to the section in the bottom of this chapter “an example of BGP path filtration by the neighbors”.

Normally, you do not expect to redistribute all routes to your IGP. A common design is to redistribute one or two routes, and make them the external routes in IGRP, or force the BGP session to generate an AS default route. When BGP redistribute routes to IGP, only the routes acquired through EBGP will be redistributed. Under most situations, you do not want to allocate your IGP to BGP, just use configuration command “network ” to list the network in AS, then your network will be broadcasted. The networks listed in this form are called local network, and enables BGP to have attribute “Origin” of IGP. They must appear in the main IP routing table, and are effective; for example, they are direct-connected routes, static routes or routes known through IGP. BGP routing process periodically scans the main IP routing table to check the existence of a local network, and accordingly updates BGP routing table if you really want BGP to execute redistribution, you must be very careful, because these may be the routes in IGP that are injected by other routers through BGP, this may bring force a kind of situation that BGP potentially injects the information into IGP, and then send back the information to BGP. Vice versa.

#### 6. Configure BGP route value

BGP route value is a number set to BGP route in order to control the route selection process, value is local for the router. The value ranges from 0 to 65535. BGP route generated locally has a default value of 32768, the route got from the neighbour values 0. The administrator can implement routing policy through the change of route value.

Use the following router configuration command to configure BGP route weight:

Command	Purpose
<b>neighbor</b> {ip-address   peer-group-name} <b>weight</b> weight	Designate a value to each route from one neighbour.

Besides, you can change the route weight through route-map.

#### 7. Configure BGP route filter based on the neighbour

There are 4 methods in BGP implementation of router software to filter BGP routes of the designated neighbours:

Use Aspath list filter together with global configuration command “**ip aspath-list**” and command “**neighbour filter-list**”.

Command	Purpose
<b>ip aspath-list</b> aspaths-list-name { <b>permit</b>   <b>deny</b> } as-regular-expression	Define an accessing list relative to BGP.
<b>router bgp</b> autonomous-system	Enter into router configuration mode.
<b>neighbor</b> {ip-address   peer-group-name} <b>filter-list</b> aspath-list-name { <b>in</b>   <b>out</b> }	Establish a BGP filter.

Use access list together with global configuration command “ip access-list” and command “neighbour distribute-list”.

Command	Purpose
<b>ip access-list standard</b> <i>access-list-name</i>	Define an access list.
<b>router bgp</b> <i>autonomous-system</i>	Enter into router configuration mode.
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> <i>access-list-name</i> { <b>in</b>   <b>out</b> }	Establish a BGP filter.

Use prefix list together with global configuration command “ip prefix-list” and command “neighbour prefix-list”.

Command	Purpose
<b>ip prefix-list</b> <i>prefix-list-name</i> { <b>permit</b>   <b>deny</b> } A.B.C.D/n <b>ge</b> x <b>le</b> y	Define a prefix list.
<b>router bgp</b> <i>autonomous-system</i>	Enter into router configuration mode.
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>prefix-list</b> <i>prefix-list-name</i> { <b>in</b>   <b>out</b> }	Establish a BGP filter.

Use route-map together with global configuration command “route-map” and command “neighbour route-map”. Using route-map can not only filter routes, but also changes routes attribute, the usage will be described in the following chapters.

For example based on neighbour filter route, please refer to “example of BGP route filtration based on the neighbor”.

#### 8. Configure BGP route filtration based on the interface

Configuring BGP route filtration based on the interface can be achieved through using access list and prefix list. Network number and the gateway address of the routes can be filtered. It can designate “access-list” option to use access list for filtration of network number of the routes, designate “prefix-list” option to use prefix list for filtration of network number of the routes, designate “gateway” option to use access list for filtration of “nexthop” attribute of the routes. It can even filter the network number and “nexthop” attribute of routes at the same time, but “access-list” option cannot be used together with “prefix-list” option. Designate “\*” can filter the routes on all interfaces.

To order to configure the filtration of BGP routes based on the interface, you should carry out the following configurations under BGP configuration mode:

Command	Purpose
<b>filter interface</b> { <b>in</b>   <b>out</b> } ( <b>access-list</b> <i>access-list-name</i> ) ( <b>prefix-list</b> <i>prefix-list-name</i> ) ( <b>gateway</b> <i>access-list-name</i> )	Filter BGP routes based on the interface.

For examples of route filtration based on the interface, please refer to “examples of BGP route filtration based on the interface”.

#### 9. Disable the nexthop treatment of BGP update

You can configure to disable the nexthop treatment of neighbour BGP update. This may be useful in non-broadcasting network (such as FR or X.25), in FR or X.25 network, BGP neighbour may not directly access all other neighbors in the same IP sub-network. There are two methods to cancel nexthop treatment:

- (9) Use the local IP address of this BGP connection to replace the nexthop address of the outgoing route;
- (10) Use route-map to designate the nexthop address of incoming or outgoing routes. (Please refer to other chapters)

- (11) Use the following router configuration command to disable nexthop treatment and use the local IP address of this BGP connection to replace the nexthop address of the outgoing routes.

Command	Purpose
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>next-hop-self</b>	Disable the nexthop treatment while carrying out BGP neighbour update.

Using this command to configure will enable the current router to inform itself to be the nexthop of the route. So, other BGP neighbours will forward packets to this network to the current router. This is very useful in non-broadcasting network environment, because there exists a path from the current router to the designated neighbor. But it is not the case in broadcasting network environment, because this will induce unnecessary extra hops.

### 61.3.2 Configuring advanced BGP features

#### 1. Use route-map to filter and modify route update

You can use route-map to filter route update and modify parameter attribute based on each neighbour. Route-map can be applied both on incoming update and outgoing update. Only the routes passing route-map can be processed while sending or accepting route update.

Route-map supports incoming and outgoing update to match with AS path, community and network number. AS matching demands the using of command “aspath-list”; the matching based on community demands the using of command “community-list”, the matching based on the network demands the use of command “ip access-list”.

Use the following BGP configuration command to configure route-map for filtration and modification of route update:

Command	Purpose
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>route-map-name</i> { <b>in</b>   <b>out</b> }	Apply route-map on incoming or outgoing routes.

For examples of using route-map to filter and modify the route update, please refer to “Examples of BGP route-map”.

#### 2. Configure aggregate address

Classless inter-domain routing can create aggregate routing (and super network) to minimize the routing table. You can configure aggregate routing in BGP through redistributing aggregate routes to BGP or through using conditional aggregate attributes described in the following task list. If there is at least one more detailed record in BGP routing table, add the aggregate address to the BGP routing table.

Use one or more router configuration commands in the following to create an aggregate address in the routing table:

Command	Purpose
<b>aggregate</b> <i>network/len</i>	Create aggregate address in BGP routing table.
<b>aggregate</b> <i>network/len</i> <b>summary-only</b>	Broadcast summary address only.
<b>aggregate</b> <i>network/len</i> <b>route-map</b> <i>map-name</i>	Generate aggregate address according to conditions designated by route-map.

For examples regarding the using of BGP route aggregation, please refer to the section in the bottom of this chapter “examples of BGP route aggregation”.

### 3. Configure BGP community attribute

The routing policy that BGP supports is mainly based on one of the 3 values in BGP routing information:

- Network number of routes:
- as\_path attribute value of routes:
- The “community” attribute value of routes

Dividing the routes into communities through “community” attribute, and applying the routing policy based on the community, thereby simplifies the configuration of control of routing information.

Community is a group of routes with the common attributes; each route may belong to several communities. AS administrators can define a certain route belongs to a certain community.

Community attribute is an optional and transferable global attribute ranging from 1 to 4,294,967,200. The famous communities pre-defined in the Internet communities include:

- No-export--- Do not advertise this route to EBGP peer (Including the EBGP peers inside the autonomous system confederation).
- No-advertise---Do not advertise this route to any peer .
- local-as---Do not advertise this route to the exterior of autonomous system (ca send this route to the other sub-AS peers in the autonomous system confederation.)

When generating, accepting or sending routes, BGP speakers can configure, add or modify the route community attribute. when aggregating routes, the generated aggregation includes the “community” attributes from complete communities of all original routes.

By default, “Community” attributes are not sent to the neighbor. Use the following BGP configuration command to designate sending “community” attribute to the neighbour:

Command	Purpose
<b>neighbor</b> {ip-address   peer-group-name} <b>send-community</b>	Designate to send attribute “community” to the neighbor.

You need to do the following jobs to configure community attribute for the router:

Command	Purpose
<b>route-map</b> map-name sequence-number {deny   permit}	Configure route-map.
<b>set community</b> community-value	Configure rule of setting.
<b>router bgp</b> autonomous-system	Enter into router configuration mode.
<b>neighbor</b> {ip-address   peer-group-name} <b>route-map</b> access-list-name {in   out }	Apply route-map.

To filter routing information based on community attributes, you need to do the following jobs:

Command	Purpose
<b>ip community-list</b> community-list-name {permit   deny} <b>communtiy-expression</b>	Define community list.
<b>route-map</b> map-name sequence-number {deny   permit}	Configure route-map.

<b>match</b> <i>community-list-name</i>	Configure rules of matching.
<b>router bgp autonomous-system</b>	Enter into router configuration mode
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>route-map-name</i> { <b>in</b>   <b>out</b> }	Apply route-map.

For examples of using community attributes, please refer to “Examples of route-map using BGP community attribute”.

#### 4. Configure autonomous system confederation

The way to reduce the number of IBGP connections is to divide an AS into several sub-AS, then form them into an autonomous system confederation. From the external perspective, the confederation looks like an AS. In the confederation, each sub-AS is full-mesh inside, and has connections with other sub-ASs in the same confederation. Even if there are EBGP sessions between peers of different sub-ASs, they may still exchange routing selection information like IBGP peers. Concretely speaking, it is saving the nexthop, MED and local precedence information.

To configure a BGP autonomous system confederation, you should designate the confederation identifier. The confederation identifier is an AS number, from an external perspective, the confederation is just like a single AS with AS number being the confederation identifier.

Use the following BGP configuration command to configure confederation identifier of the autonomous system:

Command	Purpose
<b>bgp confederation0 identifier</b> <i>autonomous-system</i>	Configure the confederation identifier of the autonomous system.

In order to designate the autonomous system number belonging to autonomous system confederation, use the following BGP configuration command:

Command	Purpose
<b>bgp confederation peers autonomous-system</b> [ <b>autonomous-system ...</b> ]	Designate the AS belongs to the confederation of autonomous system.

For examples of autonomous system confederation, please refer to “examples of BGP autonomous system confederation”.

#### 5. Configure route reflector

Another method to reduce the number of IBGP connections instead of configuring autonomous system confederation is to configure route reflector.

The internal peers of the route reflector are divided into two groups: client peers and all other routers (non-client peers). The route reflector reflects the routes between the two groups; the route reflector and its client peers form a cluster. Non-client peers must be full-mesh connected, but client peers need not. The clients in the cluster do not communicate with IBGP speakers outside the cluster.

When route reflector receives routing information, it completes the following tasks:

- Broadcast the routes from external BGP speaker to all clients and non-client peers.
- Broadcast the routes from non-client to all clients.
- Broadcast the routes from the clients to all clients and non-client peers. So, the client peers need not be full-mesh-connected.

Use the following router configuration command to configure the local router as the reflector and designate

neighbors as the router reflector client:

Command	Purpose
<b>neighbor</b> <i>ip-address</i> <b>route-reflector-client</b>	Configure the local router as route reflector and designate neighbors as the client.

An AS may have several route reflectors, the way route reflector to process other route reflectors is the same as the processing of IBGP speakers. Normally, a cluster of clients have only one route reflector, and then the cluster is identified by the route reflector 's router ID. In order to increase the redundancy and avoid the failure of single node, a cluster may have more than one route reflectors. In this case, all the route reflectors in the cluster should be configured with 4-bit cluster ID, so that the route reflector can identify the update information of the route reflector in the same cluster. All the route reflectors belonging to the same cluster should be full-mesh-connected, and they should have the same client and non-client peer set.

If there is more than one route reflector in the cluster, you can use the following BGP configuration command to configure cluster ID:

Command	Purpose
<b>bgp</b> <i>cluster-id</i> <i>cluster-id</i>	Configure cluster-ID.

For examples of the configuration of route reflector, please refer to “examples of the configuration of BGP route reflector”.

#### 6. Shut down peer entity

Use the following BGP configuration command to shut down BGP neighbour:

Command	Purpose
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>shutdown</b>	Shut down BGP neighbour.

Use the following BGP configuration command to activate the neighbour shut down previously:

Command	Purpose
<b>no neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>shutdown</b>	Activate BGP neighbour.

#### 7. Configure multihop external peer body

By default, external peers should be on a directly connected network, in order to configure multihop external peer, you need to carry out the following task:

Command	Purpose
<b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> <i>ttl</i>	Configure BGP neighbor as multihop external peer.

#### 8. Configure the management distance of BGP routes

Management distance is a kind of measurement of the preference of different routing protocol. BGP uses 3 different management distances: external distance, internal distance and local distance. The routes obtained from external BGP will be assigned with the external distance; the routes obtained from internal BGP will have a distance as internal distance, local routes will be given the local distance. Use the following BGP configuration command to configure BGP route management distance:

Command	Purpose
---------	---------

<b>distance bgp {external-distance  internal-distance  local-distance}</b>	Configure BGP route management distances.
--	---

The change of management distances of BGP route is dangerous, and normally it is not recommended. The external distance should be shorter than the distance of any other dynamic routing protocol and the internal distance should be longer than the distance of any other dynamic routing protocol.

#### 9. Adjust BGP timer

Use the following BGP configuration command to adjust the BGP “keepalive” and “holdtime” timers of detailed neighbour:

Command	Purpose
<b>neighbor [ip-address   peer group-name] timers keepalive holdtime</b>	Set “keepalive” and “holdtime” timer interval (count with unit ‘second’) for designated peer or peer community

Use command “no neighbour timers” to reset the timer interval of BGP neighbor or peer community to the default value.

#### 10. Compare MED of routes from different AS

MED is a parameter to be considered when selecting the best route from several paths. The path with lower MED value will be preferably considered than the route with higher MED value.

Under default situation, during the process of selecting the best route, MED’s comparison only takes place in the routes from the same AS. You can permit the MEDs’ comparison to take place in routing selection, regardless of which AS the routes come from.

Use the following BGP configuration command to realize the above objective:

Command	Purpose
<b>bgp always-compare-med</b>	Permit to make MEDs comparison among routes from different AS.

#### 11 · Configure the MD5 authentication for BGP neighbor

To make sure of the secure routing information forwarding between ASs, perform the password authentication on the BGP connection through the MD5 option provided by TCP.

Run the following command to achieve the previous purpose:

Command	Purpose
<b>Neighbor A.B.C.D password LINE</b>	Enables the MD5 authentication of the BGP neighbor and set the password.

You can run **no neighbor A.B.C.D password** to cancel the MD5 authentication for the BGP neighbor.

## 61.4 Monitoring and Maintaining BGP

The administrator can display or delete the BGP routing table or the content of other databases. Of course the detailed statistics information can also be displayed. The following are relative tasks:

- Deleting the BGP routing table and the database
- Displaying the routing table and the system statistics information
- Tracking the BGP information

## 61.4.1 Deleting the BGP Routing Table and the BGP Database.

The following table lists the tasks relative with high-speed cache deletion, table deletion or BGP database deletion. The commands listed in the following table are all run in EXEC mode.

Command	Purpose
<b>clear ip bgp *</b>	Resets all BGP connections.
<b>clear ip bgp as-number</b>	Resets the BGP connections of the designated autonomous system.
<b>clear ip bgp address</b>	Resets the BGP connections of the designated neighbor.
<b>clear ip bgp address soft {in out}</b>	Deletes the incoming database or the outgoing database of the designated neighbor.
<b>clear ip bgp aggregates</b>	Deletes the routes generated in route aggregation.
<b>clear ip bgp networks</b>	Deletes the routes generated during forwarding process.
<b>clear ip bgp redistribute</b>	Deleting the routes generated by the <b>network</b> command.

## 61.4.2 Displaying the Routing Table and the System Statistics Information

The detailed statistics information about the BGP routing table or the database will be displayed. The provided information can decide resource utilization and help resolving network problems. The information about the node reachability can also be displayed.

You can run the following commands to display all kinds of routing statistics information:

Command	Purpose
<b>show ip bgp</b>	Displays the BGP routing table in the system.
<b>show ip bgp prefix</b>	Displays the routes which match the designated prefix list.
<b>show ip bgp community</b>	Displays the statistics information about the group attribute.
<b>show ip bgp regexp regular-expression</b>	Displays the routes which match the designated regular expression.
<b>show ip bgp network</b>	Displays the designated BGP route.
<b>show ip bgp neighbors address</b>	Displays the information about the TCP and the BGP connections of the designated neighbor.

<b>show ip bgp neighbors</b> <i>[address]</i> [received-routes   routes   advertised-routes]	Displays the routes learned from the special BGP neighbor.
<b>show ip bgp paths</b>	Displays the information about all BGP paths in the database.
<b>show ip bgp summary</b>	Displays the states of all BGP connections.

### 61.4.3 Tracking the BGP Information

You can observe BGP connection establishment and route transmission/reception by tracking the BGP information, which helps to locate the troubles and resolve the problems. The commands to track the BGP information are shown in the following table:

Command	Purpose
<b>debug ip bgp *</b>	Tracks the general BGP information.
<b>debug ip bgp all</b>	Tracks all BGP information.
<b>debug ip bgp fsm</b>	Tracks the BGP state machine.
<b>debug ip bgp keepalive</b>	Tracks the KeepAlive packets of BGP.
<b>debug ip bgp open</b>	Tracks the OPEN packets of BGP.
<b>debug ip bgp update</b>	Tracks the UPDATE packets of BGP.

## 61.5 Examples of BGP Configuration

The following sections provide the examples of BGP configuration:

### 61.5.1 Example of BGP Route Map

The following example illustrates how to use route-map to change the incoming route attribute from the neighbor. Set the metric of all routes that come from neighbour 140.222.1.1 and meet the requirement of ASPATH accessing list “aaa” to 200, local precedence value to 250, and they are accepted, all other routes will be denied.

```

router bgp 100
!
neighbor 140.222.1.1 route-map fix-weight in
neighbor 140.222.1.1 remote-as 1
!
route-map fix-weight permit 10
match as-path aaa
set local-preference 250
set weight 200
!
ip aspath-list aaa permit ^690$
ip aspath-list aaa permit ^1800

```

In the following example, the first entry of route-map “freddy” will set the MED attributes of all routes originating

from autonomous system 690 to 127. The second entry allows the routes that don't meet the above conditions to be transferred to neighbor 1.1.1.1.

```
router bgp 100
neighbor 1.1.1.1 route-map freddy out
!
ip aspath-list abc permit ^690_
ip aspath-list xyz permit .*
!
route-map freddy permit 10
match as-path abc
set metric 127
!
route-map freddy permit 20
match as-path xyz
```

The following example illustrates how to use route-map to change the routes from route redistribution:

```
router bgp 100
redistribute rip route-map rip2bgp
!
route-map rip2bgp
match ip address rip
set local-preference 25
set metric 127
set weight 30000
set next-hop 192.92.68.24
set origin igp
!
ip access-list standard rip
permit 131.108.0.0 255.255.0.0
permit 160.89.0.0 255.255.0.0
permit 198.112.0.0 255.255.128.0
```

## 61.5.2 Example of Neighbour Configuration

In the following example, BGP router belongs to AS109, and creates two networks. This router has 3 neighbors: the first neighbor is an external one (in different AS); the second is internal one (with the same AS number).

The third is also an external one.

```
router bgp 109
network 131.108.0.0
network 192.31.7.0
neighbor 131.108.200.1 remote-as 167
neighbor 131.108.234.2 remote-as 109
neighbor 150.136.64.19 remote-as 99
```

## 61.5.3 Example of BGP Route Filtration based on the Neighbor

Here is an example of BGP path filtration based on the neighbor. The routes passing through as-path access list "test1" will receive a metric value as 100. Only routes passing through as-path access list "test2" will be sent to 193.1.12.10, similarly, only those routes passing access list "test3" will be accepted by 193.1.12.10:

```
router bgp 200
neighbor 193.1.12.10 remote-as 100
neighbor 193.1.12.10 filter-list test1 weight 100
neighbor 193.1.12.10 filter-list test2 out
neighbor 193.1.12.10 filter-list test3 in
ip aspath-list test1 permit _109_
```

```
ip aspath-list test2 permit _200$
ip aspath-list test2 permit ^100$
ip aspath-list test3 deny _690$
ip aspath-list test3 permit .*
```

## 61.5.4 Examples of BGP Route Filtration based on the Interface

The following is the example of the configuration of route filtration based on the interface. It filters the routes from interface e1/0 through access list “ac1”:

```
router bgp 122
filter e1/0 in access-list acl
```

The following example uses access list “filter-network” to filter the network numbers of the routes, and meanwhile, uses access list “filter-gateway” to filter gateway address of the routes from interface s1/0.

```
router bgp 100
filter s1/0 in access-list filter-network gateway filter-gateway
```

The following example: uses prefix list “filter-prefix” to filter the network numbers of the routes, and meanwhile, use accessing list “filter-gateway” to filter gateway address of routes from all interfaces.

```
router bgp 100
filter * in prefix-list filter-prefix gateway filter-gateway
```

## 61.5.5 Examples of Using Prefix List to Configure Route Filtration

In the following example default route 0.0.0.0/0 is denied.

```
ip prefix-list abc deny 0.0.0.0/0
```

The following example: permits routes matching prefix 35.0.0.0/8:

```
ip prefix-list abc permit 35.0.0.0/8
```

In the following example, BGP process only accepts prefix with length ranges from /8 to /24:

```
router bgp
network 101.20.20.0
filter * in prefix max24
!
ip prefix-list max24 seq 5 permit 0.0.0.0/0 ge 8 le 24
!
```

In the following configuration, the router filters routes from all interfaces, it only accepts routes with prefix from 8 to 24:

```
router bgp 12
filter * in prefix-list max24
!
ip prefix-list max24 seq 5 permit 0.0.0.0/0 ge 8 le 24
```

Here are some other examples of configuration of prefix lists

The following example: permits routes with prefix length no more than 24 in network 192/8:

```
ip prefix-list abc permit 192.0.0.0/8 le 24
```

The following example: denies routes with prefix length of more than 25 in network 192/8:

```
ip prefix-list abc deny 192.0.0.0/8 ge 25
```

The following example: permits routes with prefix length of more than 8 yet less than 24 in all address space:

```
ip prefix-list abc permit 0.0.0.0/0 ge 8 le 24
```

The following example: denies all routes with prefix length of more than 25 in all address space:

```
ip prefix-list abc deny 0.0.0.0/0 ge 25
```

This example: denies routes from network 10/8, because if the mask on class A network 10.0.0.0/8 is smaller or equal to 32 bit, all routes from that network will be denied:

```
ip prefix-list abc deny 10.0.0.0/8 le 32
```

The following example: denies routes with mask length of more than 25 in network 204.70.1.24:

```
ip prefix-list abc deny 204.70.1.0/24 ge 25
```

The following example: permits all routes:

```
ip prefix-list abc permit any
```

## 61.5.6 Example of BGP Route Aggregation

The following example illustrates how to create aggregation routes in BGP. It may be created by route redistribution or the using of conditional route aggregation function.

In the following example, command “redistribute static” is used to redistribute aggregation route 193.\*.\*:

```
ip route 193.0.0.0 255.0.0.0 null 0
```

```
!
```

```
router bgp 100  
redistribute static
```

When there is at least one route in the routing table within the designated range, the following configuration will create an aggregation route in BGP routing table. The aggregation route will be considered to be from your AS, and has the “atomic” attribution, to indicate the possibilities of the loss of information.

```
router bgp 100  
aggregate 193.0.0.0/8
```

The following example not only creates an aggregation route 193.\*.\*, but also prohibit it to broadcast the more concrete routes to all the neighbours:

```
router bgp 100  
aggregate 193.0.0.0/8 summary-only
```

## 61.5.7 Example of BGP Route Reflector

The following is an example of route reflector configuration. RTA, RTB, RTC, RTE all belong to the same autonomous system AS200, RTA serves as route reflector, RTB and RTC are route reflector clients, and RTE is normal IBGP neighbor. RTD belongs to AS100, and creates EBGP connection with RTA, the configuration is illustrated as the following:

### RTA configuration:

```
interface s1/0
ip address 2.0.0.1 255.0.0.0
!
interface s1/1
ip address 3.0.0.1 255.0.0.0
!
interface s1/2
ip address 4.0.0.1 255.0.0.0
!
interface s1/3
ip address 5.0.0.1 255.0.0.0
!
router bgp 200
neighbor 2.0.0.1 remote-as 200 /*RTC IBGP*/
neighbor 2.0.0.1 route-reflector-client
neighbor 3.0.0.1 remote-as 200 /*RTB IBGP*/
neighbor 3.0.0.1 route-reflector-client
neighbor 5.0.0.1 remote-as 200 /*RTE IBGP*/
neighbor 4.0.0.2 remote-as 100 /*RTD EBGP*/
network 11.0.0.0/8
!
ip route 11.0.0.0 255.0.0.0 2.0.0.12
```

### RTB configuration:

```
interface s1/0
ip address 3.0.0.2 255.0.0.0
!
router bgp 200
neighbor 3.0.0.1 remote-as 200 /*RTA IBGP*/
network 13.0.0.0/8
!
ip route 13.0.0.0 255.0.0.0 3.0.0.12
```

### RTC configuration:

```
interface s1/0
ip address 2.0.0.2 255.0.0.0
!
router bgp 200
neighbor 2.0.0.1 remote-as 200 /*RTA IBGP*/
network 12.0.0.0/8
!
ip route 12.0.0.0 255.0.0.0 2.0.0.12
```

### RTD configuration:

```
interface s1/0
ip address 4.0.0.2 255.0.0.0
!
router bgp 100
neighbor 4.0.0.1 remote-as 200 /*RTA EBGP*/
```

```

network 14.0.0.0/8
!
ip route 14.0.0.0 255.0.0.0 4.0.0.12

```

**RTE configuration:**

```

interface s1/0
ip address 5.0.0.2 255.0.0.0
!
router bgp 200
neighbor 5.0.0.1 remote-as 200 /*RTA IBGP*/
network 15.0.0.0/8
!
ip route 15.0.0.0 255.0.0.0 5.0.0.12

```

### 61.5.8 Example of BGP Confederation

The following is the configuration of confederation. RTA, RTB, RTC create IBGP connections, and it belongs to a private autonomous system 65010; RTE belongs to another private autonomous system 65020; RTE and RTA establish internal EBGP connection of confederation; AS65010 AS65020 comprise the confederation, whose identifier is AS200; RTD belongs to autonomous system AS100, RTD establishes EBGP connection with autonomous system 200 through RTA.

### RTA configuration:

```
interface s1/0
ip address 1.0.0.1 255.0.0.0
!
interface s1/1
ip address 2.0.0.1 255.0.0.0
!
interface s1/2
ip address 4.0.0.1 255.0.0.0
!
interface s1/3
ip address 5.0.0.1 255.0.0.0
!
router bgp 65010
bgp confederation identifier 200
bgp confederation peers 65020
neighbor 1.0.0.2 remote-as 65010 /*RTB IBGP*/
neighbor 2.0.0.2 remote-as 65010 /*RTC IBGP*/
neighbor 5.0.0.2 remote-as 65020 /*RTE EBG*/
neighbor 4.0.0.2 remote-as 100 /*RTD EBG*/
```

### RTB configuration:

```
interface s1/0
ip address 1.0.0.2 255.0.0.0
!
interface s1/1
ip address 3.0.0.1 255.0.0.0
!
router bgp 65010
bgp confederation identifier 200
bgp confederation peers 65020
neighbor 1.0.0.1 remote-as 65010 /*RTA IBGP*/
neighbor 3.0.0.2 remote-as 65010 /*RTC IBGP*/
```

### RTC configuration:

```
interface s1/0
ip address 2.0.0.2 255.0.0.0
!
interface s1/1
ip address 3.0.0.2 255.0.0.0
!
router bgp 65010
bgp confederation identifier 200
bgp confederation peers 65020
neighbor 2.0.0.1 remote-as 65010 /*RTA IBGP*/
neighbor 3.0.0.1 remote-as 65010 /*RTB IBGP*/
```

### RTD configuration:

```
interface s1/0
ip address 4.0.0.2 255.0.0.0
```

```
!
router bgp 100
neighbor 4.0.0.1 remote-as 200 /*RTA EBGP*/
```

RTE configuration:

```
interface s1/0
ip address 5.0.0.2 255.0.0.0
!
router bgp 65020
bgp confederation identifier 200
bgp confederation peers 65010
neighbor 5.0.0.1 remote-as 65010 /*RTA EBGP*/
```

## 61.5.9 Example of Route Map with BGP Group Attribute

This section includes three examples of using route map with BGP community attribute.

In the first example, “route map set-community” is applied on the outgoing update of neighbor 171.69.232.50. Set the special community attribute with value “no-export” for the routes passing access list aaa, while other routes are broadcasted normally. This special community attribute will automatically prevent BGP speakers in AS200 from advertising the route outside of the autonomous system.

```
router bgp 100
neighbor 171.69.232.50 remote-as 200
neighbor 171.69.232.50 send-community
neighbor 171.69.232.50 route-map set-community out
!
route-map set-community 10 permit
match ip address aaa
set community no-export
!
route-map set-community 20 permit
```

In the second example, “route map set-community” is used for the outgoing update of neighbour 171.69.232.90. All routes originating from AS70 will insert value 200 into the community attribute 200, all other routes will just be advertised normally.

```
route-map bgp 200
neighbor 171.69.232.90 remote-as 100
neighbor 171.69.232.90 send-community
neighbor 171.69.232.90 route-map set-community out
!
route-map set-community 10 permit
match as-path test1
set community-additive 200 200
!
route-map set-community 20 permit
match as-path test2
!
ip aspath-list test1 permit 70$
ip aspath-list test2 permit .*
```

In the third example, selectively set the MED and local preference value of routes from neighbor 171.69.232.55 according to the community attribute value of the routes. All routes matching with community list com1 will be set with MED as 8000, this may include routes with community value “100 200 300” or “900

901". These routes may have other attribute values.

All routes transmitting community list com2 will be set with the local preference value as 500.

All other routes will be set with the local priority value as 50. So, all the rest of the routes of neighbor 171.69.232.55 have the preference of 50.

```
router bgp 200
neighbor 171.69.232.55 remote-as 100
neighbor 171.69.232.55 route-map filter-on-community in
!
route-map filter-on-community 10 permit
match community com1
set metric 8000
!
route-map filter-on-community 20 permit
match community com2
set local-preference 500
!
route-map filter-on-community 30 permit
set local-preference 50
!
ip community-list com1 permit 100 200 300
ip community-list com1 permit 900 901
!
ip community-list com2 permit 88
ip community-list com2 permit 90
!
```

# Chapter 62 Configuring RSVP

## 62.1 Overview

This chapter explains how to configure RSVP. For details about RSVP Command, see “RSVP Command” in the “Network Protocol Command Reference”. For other document about Command, use index or type in Command in online help.

Try to understand RSVP before configuring it, which would be helpful for users. RSVP protocol can be used by a host to request a certain quality of business to an application data process. Routers can use RSVP protocol to transfer quality of service request and carry out reservation. RSVP request is going to be reserved on each node of data channels.

RSVP resource request is for single task data process. Logically, RSVP separates data sender and receiver, despite sender and receiver are in the same application process. RSVP is above IP protocol. Although RSVP does not transfer data, it belongs to Internet protocol (just like ICMP, IGMP or routing protocol). RSVP implementation is like routing protocol and managing protocol.

RSVP is not a routing protocol; however RSVP is able to assist a current and future routing protocol. A routing protocol decides how to transfer a data package, while RSVP deals with the Quality of Service (QoS) of the transferred data packages.

RSVP and WFQ (weighted fair queuing) or RED (random early detection) coordinate and function together. This kind of coordination contains two major concepts: use the RSVP flow between two ends, and use WFQ dialog between two routers.

## 62.2 RSVP Configuration Task List

- Enable a RSVP on a Router
- Start RSVP in a IP Phone Module Configuration
- Use RSVP to configure Command
- Configure TOS and Precedence for RSVP flow
- Use access – list in RSVP module

## 62.3 RSVP Configuration Task

### 62.3.1 Enable a RSVP on a Router

To enable RSVP on a router, users must configure the interface for starting RSVP, which can be realized by configure Command with interface on the RSVP. When the above configuration is done, RSVP protocol is able to work on these interfaces.

Configure Network interface with RSVP and use the following Commands in interface configurations:

Command	Function
<code>ip rsvp bandwidth [interface-kbps] [single-flow-kbps]</code>	Configure Network interface with RSVP

**Notes:**

When using `ip rsvp bandwidthCommand`, under default configuration (interface-kbps and single-flow-kbp), the max resource reservation for the whole port and resource reservation for single data process will be limited to just 75% of the port total resource.

## 62.3.2 Start RSVP in an IP Phone Module Configuration

Before configuring our IP Phone and IP Phone module of the router to use Voice over IP, users have to enable RSVP to use RSVP to reserve resource.

RSVP Command has to be configured on ports that requires RSVP. That is because RSVP is disable by default. (See the last chapter)

IP phone disables QoS (default), therefore, users must configure dial-peer voipCommand with enabling QoSCommand.

To enable RSVP on interface f0/0, use the following commands in dial-peer Configuration mode of none IVR type:

Command	Function
<code>req-qos { best-effort   controlled-load   guaranteed-delay }</code>	Used Qos policy in dialpeer.

## 62.3.3 Use RSVP to Configure Command

In this RSVP, users may use Command provided by the module to adjust RSVP. Adjustments including establishing RSVP conversation, RSVP path, path tear, resv, resv tear message transmission. This is going to be useful for users to test RSVP.

Users may use the following Commands in global configuration mode:

Command	Function
<code>ip rsvp local session session-ip-address session-dport {tcp   udp}</code>	By setting this Command, users may configure a new RSVP dialog, which can be used by other Commands.
<code>ip rsvp local sender session-id sender-ip-address sender-sport [bandwidth] [burst-size]</code>	Users may send path message with this Command, whose no form may send path tear message.
<code>ip rsvp local reservation session-id sender-ip-address sender-sport [guarantee   load] [bandwidth] [burst-size]</code>	Users may send resv message with this Command, whose no form may send resv tear message.

## 62.3.4 Configure TOS and Precedence for RSVP flow

To obtain better reservation results, users may use Commands offered by RSVP module to configure TOS and Precedence for RSVP. When RSVP flow is over the reserved range, the Command configures a higher TOS. When RSVP flow is within the reserved range, the command configures a lower TOS. So does Precedence.

Users may use the following Command in interface configuration mode:

Command	Function
<code>ip rsvp tos {conform exceed} tos-value</code>	This Command can be used to configure the reserved TOS options.
<code>ip rsvp precedence {conform exceed} precedence-value</code>	This Command can be used to configure the reserved precedence options.

### 62.3.5 Use Access List in RSVP Module

When users are configuring RSVP on a router, they are able to use access – list to accept or reject communication with certain hosts or routers.

Command	Function
<b>ip rsvp neighbor</b> <i>access-list-name</i>	With this function, users may configure the following Commands under interface configuration mode.

# Chapter 63 Configuring PBR

## 63.1 Overview

This section describe how to configure PBR. PBR is the abbreviation of Policy Based Routing. PBR make the user have the ability to route ip packet according some policy other than dynamic routing protocol. We currently support the following policy: based on the length of ip packet, source ip address. You can set gateway or outgoing interface for packets matching the policy. PBR can support load balance.

The rule for PBR selecting nexthop is following :

- If set ip next-hop is configured, and the gateway is reachble, the gateway will be used. If multiple gateway is configured, use the first reachable gateway. If load-balance key word is used, the load balance is used between these gateways.
- If set interface is configured, and the outgoing interface is routable (interface protocol up, and ip address is confured), use the outgoing interface. If multiple outgoing interfaces are configured, first routable interface will be used. If load-balance key word is used, the load balance is used between these interface. If both set ip next-hop and set interface configured, use set ip next-hop first.
- 3. set ip default next-hop or set default interface won't be used until routing lookup failed.

## 63.2 PBR Configuration Task List

If you want to use PBR, the following configuration is needed:

- Create standard access-list (optional)
- Create route-map
- Apply route-map on interface

## 63.3 PBR Configuration Task

### 63.3.1 Create STANDARD Access List

To create access-list, following the step bellow :

Command	Function
<code>ip access-list stand net1</code>	Enter access-list configuration mode.

### 63.3.2 Create ROUTE-map

To create route-map, following the step bellow:

Command	Function
<code>route-map pbr</code>	Enter route-map configuration.
<code>match ip address access-list</code>	Configure matching policy.
<code>match length min_length max_length</code>	Configure matching policy.
<code>set ip [default] next-hop A.B.C.D</code>	Set gateway.
<code>set [default] interface interface_name</code>	Set outgoing interface.

### 63.3.3 Apply route-MAP on interface

To enable PBR on interface , following the step bellow:

Command	Function
<b>interface</b> <i>interface_name</i>	Enter interface configurition mode.
<b>ip policy route-map</b> <i>route-map_name</i>	Apply PBR on interface.

### 63.3.4 Debug PBR

To debug PBR , following the step bellow:

Command	Function
<b>debug ip policy</b>	To debug PBR.

## 63.4 PBR configuration example

```
router configure
!
interface FastEthernet0/0
ip address 10.1.1.3 255.255.255.0
no ip directed-broadcast
ip policy route-map pbr
!
interface FastEthernet0/0.13
ip address 13.1.1.3 255.255.255.0
no ip directed-broadcast
encapsulation dot1Q 13
bandwidth 100000
delay 1
!
interface FastEthernet0/0.14
ip address 14.1.1.3 255.255.255.0
no ip directed-broadcast
encapsulation dot1Q 14
!
interface Serial0/0
ip address 11.1.1.1
no ip directed-broadcast
!
ip access-list standard net1
permit 10.1.1.2 255.255.255.255
!
ip access-list standard net2
permit 10.1.1.4 255.255.255.255
!
ip access-list standard net3
permit 10.1.1.21 255.255.255.255
!
route-map pbr 10 permit
match ip address net1
set ip next-hop 13.1.1.99
!
route-map pbr 20 permit
```

```
match ip address net2
set ip next-hop 14.1.1.99
!
route-map pbr 30 permit
match ip address net3
set ip next-hop 13.1.1.99 14.1.1.99 load-balance
!
route-map pbr 40 permit
set ip default next-hop 13.1.1.99
```

### configure explanation

Policy routing is enabled on interface f0/0. For packets originated from 10.1.1.2, the gateway is 13.1.1.99 if 13.1.1.99 is reachable, if 13.1.1.99 isn't reachable, destination base routing is used. For packets from 10.1.1.21, route-map pbr 30 is used, for load-balance key word is used, both 13.1.1.99 and 14.1.1.99 will be used as the gateway.

# Chapter 64 Configuring DNS

## 64.1 Overview

DNS is Domain Name System for short, DNS is a distributed database using in TCP/IP application.. It can provide the translation of host name and IP address, some information about email and hosts.

The name DNS is used in the TCP/IP network, such as Internet, and it orientates hosts and service according to friendly name. When the DNS name is input, the system can translate it into relative information such as IP address.

In DNS system, DNS Resolver equals to a client of DNS Server. The application can get relative information by accessing DNS Server. The base of this information is: getting the IP address according to a host name or getting the host name according to a IP address.

Dynamic DNS Resolver is used in the condition of dynamic IP addresses. Dynamic DNS Resolver can register the information about Host/address to DNS Server autotly, when the IP address changes, it can send updating message to DNS Server and the DNS Server will update its database.

### 64.1.1 DNS Application

DNS has abroad application :

- Provide translating host name to IP address for ping, telnet and traceroute.
- Provide translating IP address to host name for telnet. When traceroute gets each IP address, it can get the name of the address.
- When IP address of client changes, it can update the address in primary server.

### 64.1.2 DNS Term

- DNS Resource Record(RR):

Information, which may be empty. The set of resource information associated with a particular name is composed of separate resource records (RRs). The order of RRs in a set is not significant, and need not be preserved by name servers, resolvers, or other parts of the DNS.

- Starting Organism of Authorization (SOA)

A record is used to designated the starting point of the area. The record contains the domain name, e-mail address of the domain administrator and the settings about how to enable the DNS server to update the domain data files.

- Common types of resource records:

Parameter	Description
A	A host address.
CNAME	Identifies the canonical name of an alias.
HINFO	Identifies the CPU and OS used by a host.
MX	Identifies a mail exchange for the domain. See [RFC-974 for details.
NS	The authoritative name server for the domain.

PTR	A pointer to another part of the domain name space.
SOA	Identifies the start of a zone of authority.

- DNS Zone:

In general, the DNS database can dispart into defferent resouce records and each record is called zone. A zone can include the resource record of all the zones or parts of a zone.A zone is divide into serveral child zone is to simplize the mangement. After using this distrabuting frame, the administrator can manage every child zone effectivly when the domain name extends.

- Authoritative name server:

The DNS Server which manages the RR is named authoritative name server.Every server can be an authoritative name server or many.

- Primary server and slave server:

In order to ensure the high trustiness, DNS requests using many name server to support every zone. The RR of every zone updates to a primary server manuly or antoly.The primay server can be an authoritative name server having one or more zone. The other servers(named master DNS server) are standby server servicing for the same zone,and this can avoiding some instance when the primary server is abnormity.Master servers make their database are update to date by communicating to primary server. Copying the zone files to many name servers is named zone exchange.

## 64.2 DNS Configuration Task List

This modual realize the DNS Resolver only and the DNS Server is not range of this modual.

- Enables DNS-based host name-to-address translation
- Specify the IP address of a domain name server
- Set a default domain name
- Defines a list of domains
- Defines static host name-to-address mapping
- Specify times to retry a DNS query
- Specify timeout waiting for response to a DNS query
- Delete the mapping of a host name to IP address in cache
- Specify the IP address of a primary server
- Enable update function of dynamic DNS
- Set the period of DNS update
- Bind the domain name to a IP address or IP address of interface
- The function of information showing or debug showing

## 64.3 DNS Configuration Task

### 64.3.1 Enable DNS-based host name-to-address translation

That is,make it query the hosts by name or address. This modual enable DNS lookup by default.

In congure use the following command:

Command	Function
<b>ip domain lookup</b>	Eable DNS lookup.
<b>no ip domain lookup</b>	Disable DNS lookup.

### 64.3.2 Specify the IP address of a domain name server

It may assign several name servers, but can only appoint six at most. The name server assigned before will be queried earlier. When we use the no format without any parameter, it express for delete all the name servers.

In configure use the following command:

Command	Function
<b>ip domain name-server</b> <i>ip-address</i>	Set a domain name server
<b>no ip domain name-server</b> <i>ip-address</i>	Delete domain name server

#### Note:

**no ip domain name-server** *ip-address* Express delete a domain name server which IP address is *ip-address*.

**no ip domain name-server** Express delete all the domain name servers.

### 64.3.3 Set a default domain name

We can complete the host name by a default domain name. But the default domain name is useful only when there is no domain list.

In configure use the following command :

Command	Function
<b>ip domain name</b> <i>name</i>	Specify a default domain name.
<b>no ip domain</b> <i>name</i>	Delete the default domain name.

### 64.3.4 Define a list of domains

The DNS Resolver completes a host name by the domain list, it can try the domain list in turn until it find the host or all the domain lists are tried. The domain name will not be used if a domain list exists. We can set six domain lists at most.

In configure use the following command:

Command	Function
<b>ip domain list</b> <i>name</i>	Define a domain list.
<b>no ip domain list</b> <i>name</i>	Delete a domain list.

#### Notes:

**no ip domain list** *name* Express delete a domain name named *name*.

**no ip domain list** Express delete all the domain names.

### 64.3.5 Define static host name-to-address mapping

Any IP address can correspond to a name, and the same name can correspond to many IP addresses. By doing this, the command such as **telnet** , **ping** can use the names directly.

In configure use the following command:

Command	Function
<b>ip host</b> <i>name address1</i> [ <i>address2, ...</i> ]	Map a name to some IP address.
<b>no ip host</b> <i>name</i> [ <i>address1, ...</i> ]	Delete a map.

Example : the following express mapping a name to several IP addresses

```
router_config# ip host djh 172.16.20.209
router_config# ip host djh 172.16.20.210
```

or :

```
router_config# ip host djh 172.16.20.209 172.16.20.210
```

If you want to delete, you can delete a IP address or delete many addresses or delete the host.

```
router_config# no ip host djh 172.16.20.209 /*delete a IP address mapping to a host name djh*/
router_config# no ip host djh 172.16.20.209 172.16.20.210
/*delete 2 IP address mapping to a host name djh*/
router_config# no ip host djh /*delete the host named djh*/
```

### 64.3.6 Specify times to retry a DNS query

When sending failing or not receiving the correspond, it can send again. By default , the retry times is 3 (times).

You can modify the retry times when needing.

In configure use the following command :

Command	Function
<b>ip domain retry</b> <i>count</i>	Set retry times
<b>no ip domain retry</b>	Restore to the default

### 64.3.7 Specify timeout waiting for response to a DNS query

When sending failing or not receiving the correspond, it can send again . This time is the interval time between two sending.By default , the timeout value is 2 (seconds). You can modify the retry times when needing.

In configure use the following command:

Command	Function
<b>ip domain timeout</b> <i>seconds</i>	Set timeout value.
<b>no ip domain timeout</b>	Restore to the default.

### 64.3.8 Delete the mapping of a host name to IP address in cache

The host having been queried will be set in cache. We can delete one or all of the hosts in cache. The command can't delete the static mapping of host and IP address.

In manager use the following command :

Command	Function
---------	----------

<b>clear ip host</b> <i>name</i>	Delete a host in cache.
<b>clear ip host</b> *	Delete all the hosts in cache.

### 64.3.9 Specify the IP address of a primary server

You can only specify one primary server, if you specify another, it will replace the one earlier.

In configure use the following command:

Command	Function
<b>ip domain primary-server</b> <i>address</i>	Set a primary server.
<b>no ip domain primary-server</b>	Delete the primary server.

### 64.3.10 Enable update function of dynamic DNS

The router having static IP address doesn't need the function, so you can use the no format to disable domain dynamic. By default, the function is disable.

In configure use the following command :

Command	Function
<b>ip domain dynamic enable</b>	Enable domain dynamic.
<b>no ip domain dynamic enable</b>	Disable domain dynamic.

### 64.3.11 Set the period of DNS update

In configure use the following command:

Command	Function
<b>ip domain dynamic period</b> <i>seconds</i>	Set time of updating period.
<b>no ip domain dynamic period</b>	Restore to the default.

### 64.3.12 Bind the domain name to a IP address or IP address of interface

This command doesn't support binding the second IP address to a domain name.

After the command is using, the changing of the IP address of interface will update the mapping in the primary server, that is, dynamic domain updating.

In general, it needs to update in the following cases:

- When the router reboots, it should register to the primary server at once.
- By clock
- If the binding command is used, it will add or delete a mapping in primary server.
- When the IP address of a interface changes
- When the interface having been binded is shut up or is deleted

In configure use the following command:

Command	Function
---------	----------

<b>ip domain bind</b> <i>name interface number</i>	Bind the domain name to the primary IP address of interface (Note:an interface can only correspond to one domain name, when you use another,the later will replace for the earlier. )
<b>ip domain bind</b> <i>name interface number singly</i>	Bind the domain name to the primary IP address of interface, and delete all the hosts named <i>name</i> in primary server
<b>no ip domain bind</b> <i>name interface number</i>	Delete the mapping of the domain name to the primary IP address of interface
<b>ip domain bind</b> <i>name ip_addr</i>	Bind the domain name to a IP address. (Note: the same domain name can correpond to several IP addresses.)
<b>ip domain bind</b> <i>name ip_addr singly</i>	Bind the domain name to a IP address, and delete all the hosts named <i>name</i> in primary server
<b>no ip domain bind</b> <i>name ip_addr</i>	Delete the mapping of the domain name to the IP address
<b>no ip domain bind</b> <i>name</i>	Delete all the hosts named <i>name</i> in the primary server

#### Notes:

If the command **ip domain dynamic enable** or **ip domain primary-server** is not been configured , then command **ip domain bind** and **no ip domain bind** will not be successful , and will not be in flash memory or be deleted from flash memory.

To the command of domain dynamic,the router will register to the primary server autoly,but if the interface shut down, the communication to primary server will fail,that is,it can't register successly. In order that the register goes along after the interface shut up, the modual set a much bigger timeout and retry,so the configuring of retry and timeout go into effect after 30 seconds when the router reboots.

On the side, If we bind a domain name with an interface,when the ip address of the interface changed and makes the communication to the primary server fail,but after a while,it can restore, at this instance, we can enhance the times of retry and the seconds of timeout so that it can update successfully.

### 64.3.13 The function of information showing or debug showing

The system can show some information such as the default domain name,domain list,the host in the cache and so on.What's more, it can show information when running. This information can help us to resolve some problems.

In manager use the following commands

Command	Function
<b>show ip hosts</b>	Show the default domain name,domain list,the host in the cache and so on.
<b>show ip hosts detail</b>	It show some information of the applications using the DNS Resolver unblocking such as the queue ID(or address of a callback) an time before ttl.
<b>debug ip domain</b>	Show the debug information of this modual.

## 64.4 Examples of BGP configuration

The following configure can query and update.

# Chapter 65 IP Hardware Subnet Routing Configuration

## 65.1 IP Hardware Subnet Configuration Task

### 65.1.1 Overview

IP hardware subnet routing is similar to IP fast exchange.

When the IP hardware subnet routing is not enabled, before forwarding message containing the IP address A at the next hop, the switch first checks whether the item of destination A exists in the IP cache of hardware. If the item exists, the message will be forwarded through hardware. If the item does not exist, the message is sent to CPU and then processed through software. IP hardware subnet routing items include the destination subnet, mask, IP address of the next hop, interface and so on. When the IP hardware subnet routing is enabled, after the IP cache fails to be matched, the system is to check the IP hardware subnet routing items. If the matched item is found, the message will be directly forwarded through the next-hop IP address and the interface designated in the matched item. If the IP hardware subnet routing item is not found, the message will be sent to CPU for processing.

The IP hardware subnet routing has two modes: automatic and manual. In manual mode, you need to manually configure all routing items required by the IP hardware subnet routing. Note that routing items having longer mask of destination subnet should be configured earlier. In automatic mode, the system automatically adds the known routes to the hardware subnet routing. All the procedure is automatic after the hardware subnet routing is started.

Model	Mode Supported
3224 / 3224M / 6508	manual mode
Other layer-3 swiches	automatic mode

### 65.1.2 Configuring IP Hardware Subnet Routing

Perform the following steps to configure the IP hardware subnet routing :

Step	Command	Description
1	<code>[no] ip exf {default   destination mask} {cpu   nexthop vlan vlanid}</code>	Add or delete a hardware subnet route. Deleting a hardware subnet route requires to specify the destination network and mask. Replace <b>destination</b> and <b>mask</b> in the command line with <b>default</b> when you delete a route. In this case, The next hop is not CPU. The command is effective only in manual configuration mode.
2	<code>[no] ip exf</code>	Enable or disable the IP hardware subnet routing.

### 65.2 Configuration Example

Pay attention to the following content when you configure the routing items:

- As to the direct-connecting routing, the next hop is CPU. If the next hop is a routing interface not an IP address, do as in the direct-connecting routing.
- When the number of the routing items in the system is bigger than that of the IP hardware subnet routing items, the default routing cannot be the IP hardware subnet routing. Two or several routes, which are prefix to each other, must be used together when IP hardware subnet routing is adopted. For other items, advise to add heavy-traffic items to the hardware subnet routing table. Our 3224 series switches support 15 hardware subnet routes, including the default subnet route.
- The ARP of the next-hop IP address does not exist, the system will send an ARP request and temporarily designate the next-hop routing item as CPU. After the system receives the ARP response, the system then update the next hop to the user-designating address. If the VLAN interface where the next hop resides is found different from the configured interface during the ARP response, the next hop of the route is designated as CPU. Users then need to correct the configuration.
- If the next-hop interface or the interface protocol does not exist, the item will not be added to the hardware subnet routing table.

Suppose a switch has the following routing items:

- (9) 192.168.0.0/16 next hop 192.168.26.3/vlan1
- (10) 192.168.20.0/24 next hop 192.168.26.1/vlan1
- (11) 192.168.1.0/24 direct-connecting routing
- (12) 192.168.26.0/24 direct-connecting routing
- (13) 10.0.0.0/8 next hop 192.168.1.4/vlan2
- (14) 0.0.0.0/0 next hop 192.168.1.6/vlan2

The destination subnet of route item 1 is the prefix of subnet 2, 3 and 4. Therefore, these items should be added to the hardware subnet routing table together. Item 3 and 4 are direct-connecting routing and the next hop is CPU.

The relative configuration is as follows:

```
ip exf 192.168.20.0 255.255.255.0 nexthop 192.168.26.1 vlan 1
ip exf 192.168.1.0 255.255.255.0 cpu
ip exf 192.168.26.0 255.255.255.0 cpu
ip exf 192.168.0.0 255.255.0.0 nexthop 192.168.26.3 vlan 1
ip exf 10.0.0.0 255.0.0.0 nexthop 192.168.1.4 vlan 2
ip exf 0.0.0.0 0.0.0.0 nexthop 192.168.1.6 vlan 2
```

# Chapter 66 IP-PBR Configuration

## 66.1 IP-PBR Configuration

IP-PBR realizes software PBR functions through the hardware of switch chip.

PBR stands for Policy Based Routing. PBR enables users to rely on a certain policy not on routing protocol for routing. Software based PBR supports multiple policies and rules and also load balance. You can designate the next hop's IP address or port for those packets that are in line with policy. PBR supports load balance and applies multiple next-hop IP addresses or ports on those policy-supported packets.

Only when the next-hop egress ARP designated by route map is already learned can IP-PBR regard that this egress is valid and then the corresponding rule is effective. When a packet satisfies IP-PBR policy, the hardware directly forwards this packet to the next-hop egress that the rule specifies. This process is finished by the hardware without the operation of CPU. The packets forwarded by IP-PBR have the highest priority and only those packets unmatched with IP-PBR rule are forwarded to CPU.

The current IP-PBR supports the IP ACL policy and the next-hop IP address policy. When multiple next hops are configured, the first effect next hop is chosen. IP-PBR also supports equivalent routing that is realized by the switch chip. Hardware equivalent routing needs no extra configuration.

IP-PBR supports the following policy routing commands:

**route-map** *WORD*

**match ip address** *WORD*

**set ip next-hop** *X.X.X.X* [**load-balance**]

**ip policy route-map** *WORD*

IP-PBR is a little different from router's policy routing. IP-PBR chooses an effective next hop as the egress and drops packets if no valid next hop available, while router's policy routing selects an effective next hop but packet loss happens if this next hop has not learned ARP. Once multiple sequences are set, one difference between IP-PBR and software policy routing must be noted. Software policy routing always chooses high-priority sequence routes no matter whether IP address matched by high-priority sequences overlaps with that matched by low-priority sequences and whether these routes are effective, while IP-PBR chooses low-priority sequence routes when high-priority sequence routes invalidate.

### 66.1.1 Enabling or Disabling IP-PBR Globally

Run the following commands in global configuration mode.

Command	Purpose
<b>ip pbr</b>	The IP-PBR function is disabled by default.
<b>no ip pbr</b>	Resumes the default settings.

IP-PBR is disabled by default.

### 66.1.2 ISIS Configuration Task List

To configure IP-PBR, do as follows:

- 1) Create ACL;

- Create a route map;
- 2) Apply the route map on a port;

To create an ACL, run the following command globally:

Command	Remarks
<b>ip access-list standard</b> <i>net1</i>	Enters the ACL configuration mode and defines ACL.

To create a route map, run the following commands globally:

Command	Remarks
<b>route-map</b> <i>pbr</i>	Enters the route map configuration mode.
<b>match ip address</b> <i>access-list</i>	Configures the match-up policy.
<b>set ip next-hop</b> <i>A.B.C.D</i>	Configures the next-hop address of IP packet.

To apply policy routing on an IP-receiving port, run the following commands:

Command	Remarks
<b>interface</b> <i>interface_name</i>	Enters the interface configuration mode.
<b>ip policy route-map</b> <i>route-map_name</i>	Applies policy routing on the port.

### 66.1.3 Monitoring and Maintaining MVC

Run the following commands in EXEC mode:

Command	Operation
<b>show ip pbr</b>	It is used to display the information about RIP configuration.
<b>show ip policy</b>	Shows the port on which IP-PBR is applied.
<b>show ip pbr policy</b>	It is used to display the information about IP-PBR equivalent routing.
<b>debug ip pbr</b>	It is used to enable or disable the debugging switch of IP-PBR.

The information that IP-PBR is not running is shown:

```
switch#show ip pbr

IP policy based route state: disabled

No pbr apply item

No equiv exf apply item
```

All data related about IP-PBR running are shown below:

```
switch#show ip pbr
IP policy based route state: enabled

No equiv exf apply item

VLAN3 use route-map ddd, and has 1 entry active.
-----
Entry sequence 10, permit
Match ip access-list:
  ac1
Set Outgoing nexthop
  90.0.0.3
```

The IP-PBR policy routing information is shown below:

```
switch#show ip pbr policy
IP policy based route state: enabled

VLAN3 use route-map ddd, and has 1 entry active.
-----
Entry sequence 10, permit
Match ip access-list:
  ac1
Set Outgoing nexthop
  90.0.0.3
```

The equivalent routing information is shown below:

```
switch#show ip pbr exf
IP policy based route state: enabled

Equiv EXF has 1 entry active.
-----
Entry sequence 1, handle c1f95b0
Dest ip: 1.1.0.0/16
  90.0.0.3
  192.168.213.161
```

## 66.1.4 IP-PBR Configuration Example

Switch configuration:

```
!
ip pbr
!
interface vlan1
ip address 10.1.1.3 255.255.255.0
no ip directed-broadcast
ip policy route-map pbr
!
```

```
ip access-list standard ac1
permit 10.1.1.21 255.255.255.255
!
ip access-list standard ac2
permit 10.1.1.2 255.255.255.255
!
route-map pbr 10 permit
match ip address ac1
set ip next-hop 13.1.1.99
!
route-map pbr 20 permit
match ip address ac2
set ip next-hop 13.1.1.99 14.1.1.99 load-balance
!
```

### Configuration Description

The switch is to apply policy routing on the packets that are received from VLAN1. As to the packets whose source IPs are 10.1.1.21, their next hop is 13.1.1.99. As to the packets whose source IPs are 10.1.1.2, they are applied on **route-map pbr 20**; because **set ip next-hop** has the **load-balance** parameter, the switch chip will automatically choose 13.1.1.99 or 14.1.1.99 as the egress according to destination IP address.

# Chapter 67 Multi-VRF CE Intro

## 67.1 Overview

The Virtual Private Network (VPN) provides a secure method for multiple client networks to share the ISP-supplied bandwidth. In general, one VPN comprises a team of client networks that share a public routing table on the ISP's routers. Each client network is connected to the interface of the network devices of ISP, while ISP's device will relate each interface to a VPN routing table. One VPN routing table is also called as a VRF (VPN Routing /Forwarding table).

VRF is usually deployed on a Provider Edge (PE) device, such as MPLS VRF VPN. A PE supports multiple VPNs, and each VPN has its independent IP address space among which IP addresses can be overlapped. The VPN of a different client connects a different interface of PE, while PE differentiates the to-be-checked routing tables according to the incoming port of the packet.

Multi-VRF CE is to remove the task of connecting multiple client networks from PE to CE, which only requires a physical link to connect CE and PE. In this way, the port resource of PE is saved. CE also maintains the VRF routing table for each VPN. The packets from the client network are first forwarded on CE and then transmitted to PE after the packets pass through the ISP network.

The switch which serves as MCE connects different client networks through different ports and then relates these ports to a VPN routing table. MY COMPANY switches only support VRF settings on the VLAN port.

The MCE function is usually deployed at the edge of the large-scale MPLS-VRF VPN network. The three functions, Multi-VRF CE, MPLS label switching and the function of MPLS control layer, are independent. Figure 1.1 shows an MPLS-VRF VPN network.

Figure

1.1 MCE in the MPLS-VRF VPN network

### 67.1.1 Establishing Routes with CE

The Multi-VRF CE switch can establish routes with CE through multiple dynamic routing protocols. CE can be routers or the Ethernet switches. The routing protocols which are supported include OSPF, RIP and BEIGRP. The MCE switch also supports static routing configuration.

The MCE switch generally needs different VLAN ports to connect CEs that belong to different VPNs. The VLAN ports that are used to connect the VPNs require to be related to a VRF. CE does not need to support VRF.

## 67.1.2 Establishing Routes with PE

The MCE switch (MCE) can connect one or multiple PEs, but both MCE and the connected PEs have to get VRF configured. MCE will provide PE the routes which MCE learns from CE and learns the routes of remote client networks from PE.

The VRF route can be established between MCE and PE through dynamic routing protocols such as BGP, OSPF, RIP and BEIGRP. Of course, the VRF route can also be established statically.

In general, MCE and PE belong to different autonomous systems. Hence, the method to establish the VRF route between MCE and PE by using EBGP is the key point in this document.

# Chapter 68 Multi-VRF CE Configuration

## 68.1 Default VRF Configuration

Function	Default Configuration
VRF	There is no configuration. All routes are added to the default routing table.
VPN expansibility of VRF	There is no Routing Distinguisher (RD). There is no input/output Routing Target (RT).
Maximum number of VRF routes	10240
VRF port	N/A. None of VLAN ports is related with VRF, and the routes of ports are added to the default routing table.
IP Express Forwarding	The hardware IP routing is not enabled.

## 68.2 MCE Configuration Tasks

- Configuring VRF
- Configuring a VPN Route
- Configuring BGP Route Between PE and CE
- Testifying the VRF Connectivity between PE and CE

## 68.3 MCE Configuration

### 68.3.1 Configuring VRF

Refer to the following steps to configure one or multiple VRFs.

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.
Switch_config# <b>ip vrf</b> <i>vrf-name</i>	Creates VRF and enters the VRF configuration mode. <i>vrf-name</i> : VRF name with up to 31 characters
Switch_config_vrf# <b>rd</b> <i>route-distinguisher</i>	Sets the route distinguisher of VRF. <i>route-distinguisher</i> : Stands for the distinguisher of the route. It consists of autonomous domain ID and random numbers, or IP and random numbers.
Switch_config_vrf# <b>route-target</b> { <b>export</b>   <b>import</b>   <b>both</b> } <i>route-target-extended-community</i>	Creates the expanded VPN attributes of input/output VRF objects. <i>route-target-extended-community</i> : It consists of autonomous domain ID and random numbers, or IP and random numbers.
Switch_config_vrf# <b>interface</b> <i>intf-name</i>	Enters the interface configuration mode. <i>intf-name</i> : Stands for the name of an interface.
Switch_config_intf# <b>ip vrf forwarding</b> <i>vrf-name</i>	Relates the L3 interface with VRF. <i>vrf-name</i> : Means the name of VRF.
Switch_config_intf# <b>exit</b>	Exits from interface configuration mode.
Switch_config# <b>ip exf</b>	Enables ip hardware routing .

Switch_config# <b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interface</b> ] [ <i>vrf-name</i> ]	Browses the VRF information.
Switch_config# <b>no ip vrf</b> <i>vrf-name</i>	Deletes the configured VRF and the relation between VRF and the L3 interface. vfi-name: Means the name of VRF.
Switch_config_intf# <b>no ip vrf forwarding</b> [ <i>vrf-name</i> ]	Deletes the relation between the L3 interface and VRF.

## 68.3.2 Configuring VPN Route

The route can be established between MCE and customer device through the configuration of BGP, OSPF, RIP, BEIGRP or static route. The following takes OSPF configuration as an example, which is similar to other routes' configurations.

Note:

When a route is configured on MCE to connect the client network, the VRF attributes of the routing protocol need be specified. VRF need not be configured on the customer device.

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.
Switch_config# <b>router ospf</b> <i>process-id vrf vrf-name</i>	Starts the OSPF-VRF route and enters the configuration mode.
Switch_config_ospf# <b>network</b> <i>network-number</i> <i>network-mask area area-id</i>	Defines the OSPF network, mask and area ID.
Switch_config_ospf# <b>redistribute bgp</b> <i>ASN</i>	Forwards the designated BGP network to the OSPF network.
Switch_config_ospf# <b>exit</b>	Exits from the OSPF configuration mode.
Switch_config# <b>show ip ospf</b>	Browses the information about the OSPF protocol.
Switch_config# <b>no router ospf</b> <i>process-id</i>	Deletes the OSPF-VRF routing configuration.

## 68.3.3 Configuring the BGP Route Between PE and CE

Refer to the following configuration commands:

Command	Purpose
Switch# <b>config</b>	Enters the switch configuration mode.
Switch_config# <b>router bgp</b> <i>autonomous-system-number</i>	Starts the BGP protocol by designating autonomous system number and enters the BGP configuration mode.
Switch_config_bgp# <b>bgp log-neighbor-changes</b>	Starts the record about BGP neighbor change.
Switch_config_bgp# <b>address-family ipv4 vrf</b> <i>vrf-name</i>	Enters the configuration mode of VRF address-family.
Switch_config_bgp_af# <b>redistribute ospf</b> <i>ospf-process-id</i>	Forwards the OSPF routing information to the BGP network.
Switch_config_bgp_af# <b>network</b> <i>network-number/prefix-length</i>	Configures the network number and the mask's length that are distributed by BGP.
Switch_config_bgp_af# <b>neighbor</b> <i>address</i>	Configures the BGP neighbor and the

<b>remote-as</b> <i>ASN</i>	autonomous system number of a neighbor.
Switch_config_bgp_af# <b>exit-address-family</b>	Exits from the configuration mode of address-family.
Switch_config_bgp# <b>exit</b>	Exits from the BGP configuration mode.
Switch_config# <b>show ip bgp vpvv4</b> [ <b>all</b>   <b>rd</b>   <b>vrf</b> ]	Browses the BGP-VRF routing information.
Switch_config# <b>no router bgp</b> <i>ASN</i>	Deletes the BGP routing configuration.

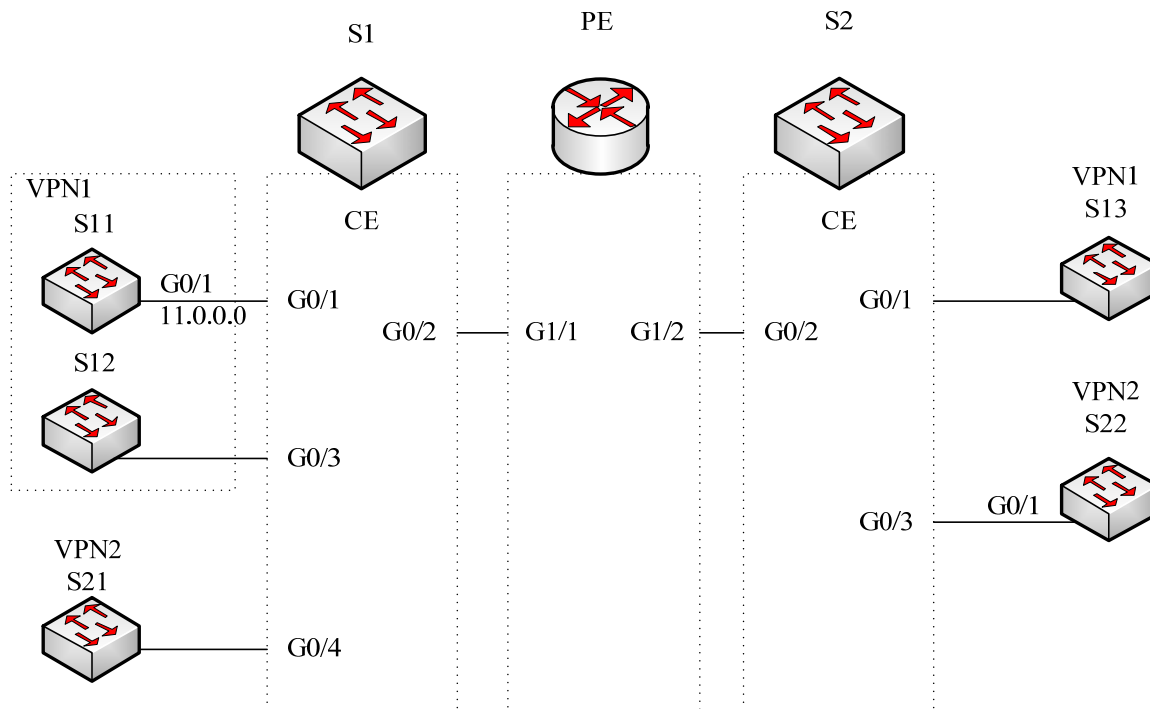

### 68.3.4 Testifying the VRF Connectivity Between PE and CE

Use the PING command with the VRF option to testify the VRF connectivity of PE and CE.

<b>Command</b>	<b>Purpose</b>
Switch# <b>ping -vrf</b> <i>vrf-name ip-address</i>	Conducts the PING operation to the addresses in VRF.

# Chapter 69 MCE Configuration Example

Figure 2.1 shows a simple VRF network. Both S1 and S2 are the Multi-VRF CE switches. S11, S12 and S13 belong to VPN1, S21 and S22 belong to VPN2, and all of them are customer devices. The OSPF route should be configured between CE and customer device, while the BGP route is configured between CE and PE.

Figure

2.1 MCE configuration example

## 69.1 Configuring S11

Set the VLAN attributes of the physical interface that connects CE:

```
Switch_config# interface gigaEthernet 0/1
Switch_config_g0/1# switchport pvid 11
Switch_config_g0/1# exit
```

Sets the IP address and the VLAN interface.

```
Switch_config# interface VLAN11
Switch_config_v11# ip address 11.0.0.2 255.0.0.0
Switch_config_v11# exit
```

Set the routing protocol between CE and customer's device:

```
Switch_config# router ospf 101
Switch_config_ospf_101# network 11.0.0.0 255.0.0.0 area 0
Switch_config_ospf_101# exit
```

## 69.2 Configuring MCE-S1

Configures VRF on the Multi-VRF CE device.

```
Switch#config
```

```
Switch_config# ip vrf vpn1
Switch_config_vrf_vpn1# rd 100:1
Switch_config_vrf_vpn1# route-target export 100:1
Switch_config_vrf_vpn1# route-target import 100:1
Switch_config_vrf_vpn1# exit
```

```
Switch_config# ip vrf vpn2
Switch_config_vrf_vpn2# rd 100:2
Switch_config_vrf_vpn2# route-target export 100:2
Switch_config_vrf_vpn2# route-target import 100:2
Switch_config_vrf_vpn2# exit
```

Configure the loopback port and the physical port, and use the address of the loopback port as the router ID of the BGP protocol.

```
Switch_config# interface loopback 0
Switch_config_l0# ip address 101.0.0.1 255.255.255.255
Switch_config_l0# exit
```

S1 connects S11 through the F0/1 port, S21 through the G0/4 port and PE through the G0/2 port.

```
Switch_config# interface gigaEthernet 0/1
Switch_config_g0/1# switchport pvid 11
Switch_config_g0/1# exit
```

```
Switch_config# interface gigaEthernet 0/4
Switch_config_g0/4# switchport pvid 15
Switch_config_g0/4# exit
```

```
Switch_config# interface gigaEthernet 0/2
Switch_config_g0/2# switchport mode trunk
Switch_config_g0/2# exit
```

Set the L3 VLAN port of a switch, bind the VRF to the VLAN port and set the IP address. S1 connects PE through two logical ports, VLAN21 and VLAN22. The two ports, VLAN11 and VLAN15, connect VPN1 and VPN2 respectively.

```
Switch_config# interface VLAN11
Switch_config_v11# ip vrf forwarding vpn1
Switch_config_v11# ip address 11.0.0.1 255.0.0.0
Switch_config_v11# exit
```

```
Switch_config# interface VLAN15
Switch_config_v15# ip vrf forwarding vpn2
Switch_config_v15# ip address 15.0.0.1 255.0.0.0
Switch_config_v15# exit
```

```
Switch_config# interface VLAN21
Switch_config_v21# ip vrf forwarding vpn1
Switch_config_v21# ip address 21.0.0.2 255.0.0.0
Switch_config_v21# exit
```

```
Switch_config# interface VLAN22
Switch_config_v22# ip vrf forwarding vpn2
Switch_config_v22# ip address 22.0.0.2 255.0.0.0
Switch_config_v22# exit
```

Configure the OSPF route between CE and customer device.

```
Switch_config# router ospf 1 vrf vpn1
Switch_config_ospf_1# network 11.0.0.0 255.0.0.0 area 0
Switch_config_ospf_1# redistribute bgp 100
Switch_config_ospf_1#exit
```

```
Switch_config# router ospf 2 vrf vpn2
Switch_config_ospf_2# network 15.0.0.0 255.0.0.0 area 0
Switch_config_ospf_2# redistribute bgp 100
Switch_config_ospf_2#exit
```

Configure the EBGp route between PE and CE.

```
Switch_config# router bgp 100
Switch_config_bgp# bgp log-neighbor-changes
```

```
Switch_config_bgp# address-family ipv4 vrf vpn1
Switch_config_bgp_vpn1# no synchronization
Switch_config_bgp_vpn1# redistribute ospf 1
Switch_config_bgp_vpn1# neighbor 21.0.0.1 remote-as 200
Switch_config_bgp_vpn1# exit-address-family
```

```
Switch_config_bgp# address-family ipv4 vrf vpn2
Switch_config_bgp_vpn2# no synchronization
Switch_config_bgp_vpn2# redistribute ospf 2
Switch_config_bgp_vpn2# neighbor 22.0.0.1 remote-as 200
Switch_config_bgp_vpn2# exit-address-family
Switch_config_bgp# exit
```

Create VLAN.

```
Switch_config# vlan 1,11-12,21-22
```

Enables the forwarding of subnet route of the switch.

```
Switch_config# ip exf
```

## 69.3 Configuring PE

Set VRF on PE:

```
Switch#config
Switch_config# ip vrf vpn1
Switch_config_vrf_vpn1# rd 200:1
Switch_config_vrf_vpn1# route-target export 200:1
Switch_config_vrf_vpn1# route-target import 200:1
Switch_config_vrf_vpn1# exit
```

```
Switch_config# ip vrf vpn2
Switch_config_vrf_vpn2# rd 200:2
Switch_config_vrf_vpn2# route-target export 200:2
Switch_config_vrf_vpn2# route-target import 200:2
Switch_config_vrf_vpn2# exit
```

Set the loopback interface as the router identifier:

```
Switch_config# interface loopback 0
Switch_config_l0# ip address 102.0.0.1 255.255.255.255
Switch_config_l0# exit
```

Set the physical interface which connects PE and CE: G1/1 and G1/2 connect S1 and S2 respectively:

```
Switch_config# interface gigaEthernet 1/1
Switch_config_g1/1# switchport mode trunk
Switch_config_g1/1# interface gigaEthernet 1/2
Switch_config_g1/2# switchport mode trunk
Switch_config_g1/2# exit
```

Set the L3 VLAN interface of PE, which connects S1:

```
Switch_config# interface VLAN21
Switch_config_v21# ip vrf forwarding vpn1
Switch_config_v21# ip address 21.0.0.1 255.0.0.0
Switch_config_v21# exit
```

```
Switch_config# interface VLAN22
Switch_config_v22# ip vrf forwarding vpn2
Switch_config_v22# ip address 22.0.0.1 255.0.0.0
Switch_config_v22# exit
```

Set the L3 VLAN interface of PE, which connects S2:

```
Switch_config# interface VLAN31
Switch_config_v31# ip vrf forwarding vpn1
Switch_config_v31# ip address 31.0.0.1 255.0.0.0
Switch_config_v31# exit
```

```
Switch_config# interface VLAN32
Switch_config_v32# ip vrf forwarding vpn2
Switch_config_v32# ip address 32.0.0.1 255.0.0.0
Switch_config_v32# exit
```

Set the EBGp of PE:

```
Switch_config# router bgp 200
Switch_config_bgp# bgp log-neighbor-changes
Switch_config_bgp# address-family ipv4 vrf vpn1
Switch_config_bgp_vpn1# no synchronization
Switch_config_bgp_vpn1# neighbor 21.0.0.2 remote-as 100
Switch_config_bgp_vpn1# neighbor 31.0.0.2 remote-as 300
Switch_config_bgp_vpn1# exit-address-family
```

```
Switch_config_bgp# address-family ipv4 vrf vpn2
Switch_config_bgp_vpn2# no synchronization
Switch_config_bgp_vpn2# neighbor 22.0.0.2 remote-as 100
Switch_config_bgp_vpn2# neighbor 32.0.0.2 remote-as 300
Switch_config_bgp_vpn2# exit-address-family
Switch_config_bgp# exit
```

Set VLAN and enable the subnet routing forwarding.

```
Switch_config# vlan 1,21-22,31-32
Switch_config# ip exf
```

## 69.4 Configuring MCE-S2

Configures VRF:

```
Switch#config
Switch_config# ip vrf vpn1
Switch_config_vrf_vpn1# rd 300:1
Switch_config_vrf_vpn1# route-target export 300:1
```

```
Switch_config_vrf_vpn1# route-target import 300:1
Switch_config_vrf_vpn1# exit
```

```
Switch_config# ip vrf vpn2
Switch_config_vrf_vpn2# rd 300:2
Switch_config_vrf_vpn2# route-target export 300:2
Switch_config_vrf_vpn2# route-target import 300:2
Switch_config_vrf_vpn2# exit
```

Configure the loopback port and the physical port, and use the address of the loopback port as the router ID of the BGP protocol.

```
Switch_config# interface loopback 0
Switch_config_l0# ip address 103.0.0.1 255.255.255.255
Switch_config_l0# exit
```

S2 connects S13 through the F0/1 port, S22 through the G0/3 port and PE through the G0/2 port.

```
Switch_config# interface gigaEthernet 0/1
Switch_config_g0/1# switchport pvid 41
Switch_config_g0/1# exit
```

```
Switch_config# interface gigaEthernet 0/3
Switch_config_g0/3# switchport pvid 46
Switch_config_g0/3# exit
```

```
Switch_config# interface gigaEthernet 0/2
Switch_config_g0/2# switchport mode trunk
Switch_config_g0/2# exit
```

Set the L3 VLAN port of a switch, bind the VRF to the VLAN port and set the IP address. S2 connects PE through two logical ports, VLAN31 and VLAN32. The two ports, VLAN41 and VLAN46, connect VPN1 and VPN2 respectively.

```
Switch_config# interface VLAN41
Switch_config_v41# ip vrf forwarding vpn1
Switch_config_v41# ip address 41.0.0.1 255.0.0.0
Switch_config_v41# exit
```

```
Switch_config# interface VLAN46
Switch_config_v46# ip vrf forwarding vpn2
Switch_config_v46# ip address 46.0.0.1 255.0.0.0
Switch_config_v46# exit
```

```
Switch_config# interface VLAN31
Switch_config_v31# ip vrf forwarding vpn1
Switch_config_v31# ip address 31.0.0.2 255.0.0.0
Switch_config_v31# exit
```

```
Switch_config# interface VLAN32
Switch_config_v32# ip vrf forwarding vpn2
Switch_config_v32# ip address 32.0.0.2 255.0.0.0
Switch_config_v32# exit
```

Configure the OSPF route between CE and customer device.

```
Switch_config# router ospf 1 vrf vpn1
Switch_config_ospf_1# network 41.0.0.0 255.0.0.0 area 0
Switch_config_ospf_1# redistribute bgp 300
```

```
Switch_config_ospf_1#exit
```

```
Switch_config# router ospf 2 vrf vpn2  
Switch_config_ospf_2# network 46.0.0.0 255.0.0.0 area 0  
Switch_config_ospf_2# redistribute bgp 300  
Switch_config_ospf_2# exit
```

Configure the EBGp route between PE and CE.

```
Switch_config# router bgp 300  
Switch_config_bgp# bgp log-neighbor-changes  
  
Switch_config_bgp# address-family ipv4 vrf vpn1  
Switch_config_bgp_vpn1# no synchronization  
Switch_config_bgp_vpn1# redistribute ospf 1  
Switch_config_bgp_vpn1# neighbor 31.0.0.1 remote-as 200  
Switch_config_bgp_vpn1# exit-address-family  
  
Switch_config_bgp# address-family ipv4 vrf vpn2  
Switch_config_bgp_vpn2# no synchronization  
Switch_config_bgp_vpn2# redistribute ospf 2  
Switch_config_bgp_vpn2# neighbor 32.0.0.1 remote-as 200  
Switch_config_bgp_vpn2# exit-address-family  
Switch_config_bgp# exit
```

Create VLAN.

```
Switch_config# vlan 1,31-32,41,46
```

Enables the forwarding of subnet route of the switch.

```
Switch_config# ip exf
```

## 69.5 Setting S22

Set the VLAN attributes of the physical interface of CE, and connect S22 and S2 through interface f0/1:

```
Switch_config# interface gigaEthernet 0/1  
Switch_config_g0/1# switchport pvid 46  
Switch_config_g0/1# exit
```

Sets the IP address and the VLAN interface.

```
Switch_config# interface VLAN46  
Switch_config_v46# ip address 46.0.0.2 255.0.0.0  
Switch_config_v46# exit
```

Set the routing protocol between CE and customer's device:

```
Switch_config# router ospf 103  
Switch_config_ospf_103# network 46.0.0.0 255.0.0.0 area 0  
Switch_config_ospf_103# exit
```

## 69.6 Testifying VRF Connectivity

Run the PING command on S1 to testify the connectivity of VPN1 between S1 and S11:

```
Switch# ping -vrf vpn1 11.0.0.2  
!!!!  
--- 11.0.0.2 ping statistics ---  
5 packets transmitted, 5 packets received, 0% packet loss
```

round-trip min/avg/max = 0/0/0 ms

Testify the connectivity between S1 and PE:

```
Switch# ping -vrf vpn1 21.0.0.1
```

```
!!!!
```

```
--- 21.0.0.1 ping statistics ---
```

```
5 packets transmitted, 5 packets received, 0% packet loss
```

```
round-trip min/avg/max = 0/0/0 ms
```

# Chapter 70 VRRP Configuration

## 70.1 Overview

The Virtual Router Redundancy Protocol (VRRP) ensures the successful single-node service in the default static routing condition. VRRP avoids the defects of the statically designated gateway. A group of SWITCHs can work together as a virtual SWITCH through VRRP. The virtual SWITCH has a virtual IP address and a virtual MAC address for the outside. VRRP chooses one SWITCH from the SWITCH group as the master SWITCH, responsible for forwarding packet. When the master SWITCH has problems, the standby SWITCH will promptly take over the tasks of the master SWITCH without changing the default gateway address. The whole takeover process is transparent to the terminal system. This mechanism can provide fast and effective resolution when trouble occurs.

## 70.2 VRRP Configuration Task List

- Enabling/Disabling VRRP on the Interface
- Configuring VRRP authentication mode
- Configuring VRRP priority preemption
- Configuring VRRP priority
- Configuring VRRP clock value
- Monitoring and maintaining VRRP

## 70.3 VRRP Configuration Task

### 70.3.1 Configuring VRRP Virtual IP Address

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp</b> <i>vrid</i> <b>associate</b> <i>virtual-address</i> <i>address-mask</i>	Configures VRRP Virtual IP address on the interface
<b>no vrrp</b> <i>vrid</i> <b>associate</b> [ <i>virtual-address</i> <i>address-mask</i> ]	Deletes VRRP Virtual IP address on the interface

The virtual SWITCH is enabled after the virtual address of VRRP is configured. The virtual address and the primary IP address of the port must be in the same network segment. Otherwise, the virtual SWITCH remains in the Init state. When the virtual IP address and the IP address of the port are consistent, the system automatically promote the precedence of the routing SWITCH to 255.

### 70.3.2 Configuring VRRP Authentication Mode

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp</b> <i>vrid</i> <b>authentication</b> <i>WORD</i>	Configures VRRP authentication mode to simple-text.
<b>no vrrp</b> <i>vrid</i> <b>authentication</b>	Resumes the VRRP authentication mode

	to the default setting.
--	-------------------------

In simple-text authentication mode, the authentication character string is in the message as clear code and is forwarded out. The receiver checks the authentication character string in the message to see whether it matches the locally configured authentication character string. The authentication character string has eight characters at most.

By default, the authentication mode of VRRP is no-authen.

### 70.3.3 Configuring VRRP Description

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid description WORD</b>	Configures VRRP description information
<b>no vrrp vrid description</b>	Deletes VRRP description information

VRRP description information, which is used for stating the usage of local VRRP.

By default, VRRP has no description information.

### 70.3.4 Configuring VRRP Priority Preemption

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid preempt [delay second]</b>	Configures VRRP priority preemption
<b>no vrrp vrid preempt [delay]</b>	Resumes the default VRRP priority preemption mode.

The priority preemption is effective only to the backup SWITCH. After the backup SWITCH receives the announce message from the master SWITCH, it will examine the priority of the master SWITCH. If the priority level of the master SWITCH is lower than the locally configured priority level and the backup SWITCH is configured with priority preemption, the backup SWITCH will leap from the backup state to the master state and send the announce message to the outside. Otherwise, the backup SWITCH remains in the backup state.

In default state, the authentication mode of VRRP is no-authen.

### 70.3.5 Configuring VRRP Protocol Packet MAC Address

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid source-mac-use-system</b>	Configures VRRP group to forward packets with system mac address
<b>no vrrp vrid source-mac-use-system</b>	Configures VRRP group to forward packets with protocol mac address

By default, VRRP protocol packet forward source address with protocol mac address; after the command is configured, VRRP protocol packet forwards the system mac address as the source address.

## 70.3.6 Configuring VRRP Priority

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid priority value (1~254)</b>	Configures VRRP priority
<b>no vrrp vrid priority</b>	Resumes the default VRRP priority mode.

When the virtual address and the port address are same, VRRP will automatically increase its priority value to 255. After the virtual address or the port address changes, the priority value automatically resumes to the original value.

The default value is 100.

## 70.3.7 Configuring VRRP Clock Value

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid timer advertise { value   dsec value   csec value }</b>	Configures VRRP clock value
<b>no vrrp vrid timer advertise</b>	Resumes the VRRP clock value to the default value.
<b>no vrrp vrid timer learn</b>	Configures VRRP clock as the learning mode

The clock value means the shortest time for the virtual routing SWITCH to recover from a trouble. When the master routing SWITCH is down, the backup routing SWITCH will serve as the master routing SWITCH after the  $3 \times \text{advertisement} + \text{skew\_time}$  interval. It is clear that the trouble cannot be removed immediately if the advertisement clock value is too big. Hence, the default value of the advertisement clock is recommended.

The default value is 1 second.

## 70.3.8 Configuring VRRP Monitoring Object

Run the following commands in vlan interface configuration mode.

Command	Purpose
<b>vrrp vrid track interface intf-id value</b>	<b>Configures VRRP monitoring local interface state</b>
<b>no vrrp vrid track interface intf-id</b>	<b>Resumes to the default setting</b>
<b>vrrp vrid track ip ip-address value</b>	<b>Configures VRRP monitoring to the static routing state to the designated address</b>
<b>no vrrp vrid track ip ip-address</b>	<b>Resumes to the default setting.</b>

With the monitoring function, VRRP group can adjust the priority appropriately according to the change of the

link state. It provides an opportunity of switching master line state to the backup line state. The change of the link state refers to whether the destination link bypass the VRRP routing SWITCH is reachable, rather than the VRRP SWITCH itself is reachable.

VRRP supports two monitoring objects: First, monitoring the interface status. When the monitored port link state is down, lower the priority of itself proactively. Second, monitoring the static route state of designated node. When the monitored route is unreachable, lower the priority of itself proactively. Monitoring the static route state of designated node needs to apply the function of BFD detecting static route.

### 70.3.9 Monitoring and Maintaining VRRP

Run the following commands in EXEC configuration mode.

Command	Purpose
<b>show vrrp { brief   [interface vlan_intf] [detail]}</b>	Displays the VRRP information.
<b>debug vrrp [interface intf-id vrid] {errors   events   packets   all}</b>	Enables the debugging on-off for VRRP packets and events.
<b>no debug vrrp</b>	Disables the debugging on-off for VRRP packets and events.

Displaying the VRRP information:

```
Switch_config# show vrrp interface vlan 1 detail
VLAN1 - Group 1
  VRRP State is Master
  Virtual IP address : 192.168.20.110/24
  Virtual Mac address : 0000.5e00.0101
  Current Priority : 100 (Config 100)
  VRRP timer : Advertise 1.0 s (default) master_down 3.6 s
  VRRP current timer : Advertise 1.0 s master_down 0.0 s preempt after 0.0 s
  Authentication string is not set
  Preempt is set (delay : 0 s)
  Learn Advertise Interval is not set
  Master Router IP : 192.168.20.118, priority : 100, advertisement : 1.0 s
```

### 70.3.10 VRRP Configuration Example

The network topology is shown in figure 1.

Figure1 70-1 Network topology

## Configuring SWITCH Switch A

- Fault 1: Configure the address for the interface of the private network.

Switch\_config\_v1# **ip address** 192.168.20.18 255.255.255.0

- Fault 2: Configure the address for the interface of the public network.

Switch\_config\_v2# **ip address** 211.162.1.120 255.255.255.0

## **Configuring PC and Server of the Private Network**

Configure the default gateway for each PC and server in the private network to 192.168.20.1.

# Chapter 71 Multicast Overview

The chapter describes how to configure the multicast routing protocol. For the details of the multicast routing commands, refer to the part “Multicast Routing Commands”.

The traditional IP transmission allows only one host to communicate with a single host (unicast communication) or to communicate with all hosts (broadcast communication). The multicast technology allows one host to send message to some hosts. These hosts are called as group members.

The destination address of the message sent to the group member is a D-class address (224.0.0.0~239.255.255.255). The multicast message is transmitted like UDP. It does not provide reliable transmission and error control as TCP does.

The sender and the receiver make up of a multicast application. The sender can send the multicast message without joining in a group. However, the receiver has to join in a group before it receives the message from the group.

The relationship between group members is dynamic. The host can join in or leave a group at any time. There is no limitation to the location and number of the group member. If necessary, a host can be a member of multiple groups. Therefore, the state of the group and the number of group members varies with the time.

The router can maintain the routing table for forwarding multicast message by executing the multicast routing protocol such as PIM-DM and PIM-SM. The router learns the state of the group members in the directly-connected network segment through IGMP. The host can join in a designated IGMP group by sending the **IGMP Report** message.

The IP multicast technology is suitable for the one-to-multiple multimedia application.

## 71.1 Multicast Routing Realization

In the router software of our router, the multicast routing includes the following regulations:

- IGMP runs between the router and the host in the LAN, which is used to track the group member relationship.
- OLNK is a static multicast technology, which is used in the simple topology. It realizes the multicast forwarding and effectively saves CPU and bandwidth.
- PIM-DM, PIM-SM and DVMRP is dynamic multicast routing protocols. They run between routers and realizes the multicast forwarding by creating the multicast routing table.

The following figure shows the multicast protocols used in the IP multicast applications:

## 71.2 Multicast Routing Configuration Task List

### 71.2.1 Basic Multicast Configuration Task List

- Starting up the multicast routing (mandatory)
- Configuring TTL threshold (optional)
- Canceling rapid multicast forwarding (optional)
- Configuring static multicast route (optional)
- Configuring multicast boundary (optional)
- Configuring multicast helper (optional)
- Configuring Stub multicast route (optional)
- Monitoring and maintaining multicast route (optional)

### 71.2.2 IGMP Configuration Task List

- Modifying the current version of IGMP
- Configuring the IGMP query interval
- Configuring IGMP Querier interval
- Configuring the maximum response time of IGMP
- Configuring the query interval of the last IGMP group member
- Static IGMP configuration
- Configuring the IGMP **Immediate-leave** list

### 71.2.3 PIM-DM CONFIGURATION Task List

- Regulating the timer
- Designate the PIM-DM version
- Configuring the state refreshment
- Configuring the filtration list
- Setting the DR priority
- Clearing (S,G) information

## 71.2.4 PIM-SM Configuration Task List

- Configuring static RP
- Configuring standby BSR
- Configuring standby RP
- Displaying PIM-SM multicast routing
- Clearing multicast routes learned by PIM-SM

# Chapter 72 Basic Multicast Routing Configuration

## 72.1 Starting up Multicast Routing

To allow the router software to forward the multicast message, you must start up the multicast routing. Run the following command in global configuration mode to start up the multicast message forwarding:

Command	Purpose
<code>ip multicast-routing</code>	Starts up the multicast routing.

## 72.2 Starting up the Multicast Function on the Port

When the multicast routing protocol runs on a port, the IGMP is activated on the port. The multicast routing protocols include OLNK, PIM-DM, PIM-SM and DVMRP. Only one multicast routing protocol is allowed to run on the same port. When the router connects multiple multicast domains, different multicast protocols can be run on different ports.

Although the router software can function as the multicast boundary router (MBR). If possible, do not simultaneously run multiple multicast routing protocols on the same router for some multicast routing protocols may be badly affected. For example, when PIM-DM and BIDIR PIM-SM simultaneously run, confusion is to occur.

### 72.2.1 Starting up PIM-DM

Run the following command to run PIM-DM on a port and then activate the multicast dense mode function:

Command	Purpose
<code>ip pim-dm</code>	Enters the port where PIM-DM is running and then activates PIM-DM multicast routing process in port configuration mode.

### 72.2.2 Starting up PIM-SM

To run PIM-DM on a port and activate the PIM-DM multicast, perform the following operation:

Command	Purpose
<code>ip pim-sm</code>	Enters a port where PIM-SM needs to run and then activates the PIM-SM multicast routing process in port configuration mode.

## 72.3 Configuring TTL Threshold

Run the command `ip multicast ttl-threshold` to configure the TTL threshold of the multicast message that is allowed to pass the port. Run the command `no ip multicast ttl-threshold` to use the default threshold value 1.

Command	Purpose
<b>ip multicast ttl-threshold</b> <i>ttl-value</i>	Configures the TTL threshold on the port.

### Example

The following example shows how the administrator configures the TTL threshold on a port:  
interface ethernet 1/0

```
ip multicast ttl-threshold 200
```

## 72.4 Configuring IP Multicast Boundary

Run the command **ip multicast boundary** to configure the multicast boundary for the port. Run the command **no ip multicast boundary** to cancel the configured boundary. The commands used in the second configuration will replace the commands used in the first configuration.

Command	Purpose
<b>ip multicast boundary</b> <i>access-list</i>	Configures the multicast boundary for the port.

### Example

The following example shows how to configure the management boundary for a port:

```
interface ethernet 0/0
ip multicast boundary acl
ip access-list standard acl
permit 192.168.20.97 255.255.255.0
```

## 72.5 Configuring IP Multicast Helper

Run the command **ip multicast helper-map** to use the multicast route to connect two broadcast networks in the multicast network. Run the command **no ip multicast helper-map** to cancel the command.

Command	Purpose
<b>interface</b> <i>type number</i>	Enters the interface configuration mode.
<b>ip multicast helper-map broadcast</b> <i>group-address access-list</i>	Configures the command <b>ip multicast helper</b> to convert the broadcast message to the multicast message.
<b>ip directed-broadcast</b>	Allows the directional broadcast.
<b>ip forward-protocol</b> [ <i>port</i> ]	Configures the port number allowing to forward the message.

On the last-hop router connecting the destination broadcast network, perform the following operations:

Command	Purpose
<b>interface</b> <i>type number</i>	Enters the interface configuration mode.
<b>ip directed-broadcast</b>	Allows the directional broadcast.
<b>ip multicast helper-map</b> <i>group-address broadcast-address access-list</i>	Configures the command <b>ip multicast helper</b> to convert the multicast message to the

	broadcast message.
<b>ip forward-protocol</b> [port]	Configures the port number allowing to forward the message.

## Example

The following example shows how to configure the command **ip multicast helper**.

The configuration of the router is shown in the following figure. Configure the command **ip directed-broadcast** on the e0 port of the first-hop router to handle the directional message. Configure **ip multicast helper-map broadcast 230.0.0.1 testacl1**, allowing to convert the UDP broadcast message with port number 4000 that is sent from the source address 192.168.20.97/24 to the multicast message with the destination address 230.0.0.1.

Configure the command **ip directed-broadcast** on the e1 port of the last-hop router to handle the directional message. Configure **ip multicast helper-map 230.0.0.1 172.10.255.255 testacl2**, allowing to convert the multicast message with port number 4000 and the destination address 230.0.0.1 that is sent from the source address 192.168.20.97/24 to the broadcast message with the destination address 172.10.255.255.

In the first-hop router connecting the source broadcast network, perform the following operations: (the router is configured on the VLAN port)

```
interface ethernet 0
ip directed-broadcast
ip multicast helper-map broadcast 230.0.0.1 testacl
ip pim-dm
!
ip access-list extended testacl permit udp 192.168.20.97 255.255.255.0 any
ip forward-protocol udp 4000
```

In the last-hop router connecting the destination broadcast network, perform the following operations:

```
interface ethernet 1
ip directed-broadcast
ip multicast helper-map 230.0.0.1 172.10.255.255 testacl2
ip pim-dm
!
ip access-list extended testacl2 permit udp 192.168.20.97 255.255.255.0 any
ip forward-protocol udp 4000
```

## 72.6 Configuring Stub Multicast Route

Run the commands **ip igmp helper-address** and **ip pim-dm neighbor-filter** to configure the Stub multicast route.

On the port where the stub router and the host are connected, perform the following operations:

Command	Purpose
<b>interface</b> <i>type number</i>	Enters the interface configuration mode.
<b>ip igmp helper-address</b> <i>destination-address</i>	Configures the command <b>ip igmp helper-address</b> to forward the multicast message to the central router.

On the port where the central router and the stub router are connected, perform the following operations:

Command	Purpose
---------	---------

<b>interface</b> <i>type number</i>	Enters the interface configuration mode.
<b>ip pim neighbor-filter</b> <i>access-list</i>	Filters all <b>pim</b> messages on the stub router.

## Example

The configuration of router A and B is shown as follows:

Stub Router A Configuration

ip multicast-routing

ip pim-dm

ip igmp helper-address 10.0.0.2

Central Router B Configuration

ip multicast-routing

ip pim-dm

ip pim-dm neighbor-filter stubfilter

ip access-list stubfilter

deny 10.0.0.1

## 72.7 Monitoring and Maintaining Multicast Route

## Clearing the multicast cache and the routing table

If special caches or the routing table is invalid, you need to clear its content. Run the following commands in management mode:

Command	Purpose
<code>clear ip igmp group [type number] [group-address   &lt;cr&gt;]</code>	Clears the items in the IGMP cache.
<code>clear ip mroute [*   group-address   source-address]</code>	Clears the items in the multicast routing table.

## Displaying the multicast routing table and system statistics information

The detailed information about the IP multicast routing table, cache or database helps to judge how the resources are used and to resolve network problems.

Run the following commands in management mode to display the statistics information about the multicast route:

Command	Purpose
<b>show ip igmp groups</b> [ <i>type number</i>   <i>group-address</i> ] [ <i>detail</i> ]	Displays the information about the multicast group in the IGMP cache.
<b>show ip igmp interface</b> [ <i>type number</i> ]	Displays the IGMP configuration information on the interface.
<b>show ip mroute mfc</b>	Displays the multicast forwarding cache.
<b>show ip rpf</b> [ <i>ucast</i>   <i>mstatic</i>   <i>pim-dm</i>   <i>pim-sm</i>   <i>dvmrp</i> ] <i>source-address</i>	Displays the RPF information.

# Chapter 73 IGMP Configuration

## 73.1 IGMP Overview

Internet Group Management Protocol (IGMP) is a protocol used to manage multicast group members. IGMP is an asymmetric protocol, containing the host side and the switch side. At the host side, the IGMP protocol regulates how the host, the multicast group member, reports the multicast group it belongs to and how the host responds to the query message from the switch. At the switch side, the IGMP protocol regulates how the IGMP-supported switch learns the multicast group member ID of the hosts in the local network and how to modify the stored multicast group member information according to the report message from the host.

Since our switches support the IGMP Router protocol, the multicast routing protocol can be provided with the information about the multicast group members in the current network and the switch decides whether to forward the multicast message. In a word, to enable the switch support the multicast process of the IP message, the switch need be configured to support the multicast routing protocol and the IGMP Router protocol. Currently, MY COMPANY' switches support the IGMP Router protocol and version 3 IGMP, the latest version.

There is no independent startup commands for IGMP. The function of the IGMP-Router protocol is started up through the multicast routing protocol.

## 73.2 IGMP Configuration

The commands to configure the attributes of the IGMP-Router mainly are the commands to adjust the IGMP parameters. The following is to describe these commands. For details about these commands, refer to explanation documents relative to the IGMP commands.

## 73.3 Changing Current IGMP Version

Up to now, the IGMP protocol has three formal versions. The corresponding RFCs are RFC1112, RFC2236 and RFC3376. IGMP V1 supports only the function to record the multicast group members. IGMP V2 can query the designated multicast group member, generates the leave message when an IGMP host leaves a multicast group, and shortens the change delay of the group member. IGMP V3 has additional functions to update and maintain the multicast group member IDs which correspond to the source host addresses. The IGMP Router protocol of IGMP V3 is fully compatible with the host side of IGMP V1 and IGMP V2. MY COMPANY's switch software supports the IGMP Router protocols of the three IGMP versions.

You can configure the IGMP-Router function at different interfaces (the multicast routing protocol configured on different interfaces can start up the IGMP-Router function) and different versions of IGMP can be run on different interfaces.

Note that a multicast switch can start up the IGMP-Router function on only one of the ports that connect the same network.

Run the following command in interface configuration mode to change the version of the IGMP-Router protocol on a port:

Command	Purpose
---------	---------

<code>ip igmp version <i>version_number</i></code>	Changes the IGMP version running on the current port.
--	---

### 73.3.1 Configuring IGMP Query Interval

No matter what version number of the current IGMP-Router protocol is, the multicast switch can send the IGMP General Query message every a certain time on the port where the IGMP-Router function is started. The transmission address is 224.0.0.1. The purpose of the multicast switch is to get the report message from the IGMP host and therefore know which multicast group each IGMP host in the network belongs to. The interval to send the General Query message is called as IGMP Query Interval. If the parameter IGMP Query Interval is set to a big value, the switch cannot immediately receive the information about which multicast group the current IGMP host belongs to. If the parameter IGMP Query Interval is set to a small value, the flow of the IGMP message is to increase in the current network.

Run the following command in interface configuration mode to modify the IGMP query interval on a port:

Command	Purpose
<code>ip igmp query-interval <i>time</i></code>	Modifies the IGMP query interval on the current interface (unit: second).

### 73.3.2 Configuring IGMP Querier Interval

As to version 2 and version 3 of the IGMP-Router protocol, if another switch that runs the IGMP-Router protocol exists in the same network, you need to choose a querier. Querier stands for a switch that can send the query message (In fact, it is a port of the switch where the IGMP-Router protocol is enabled). Normally, one network has only one querier, that is, only one switch sends the IGMP Query message. There is no querier choice for IGMP-Router V1 because the multicast routing protocol decides which switch to send the IGMP Query message in IGMP-Router V1.

IGMP-Router V2 and IGMP-Router V3 have the same querier choice mechanism, that is, the switch with the minimum IP address is the querier in the network. The switch that is not the querier needs to save a clock to record the existence of the querier. If the clock times out, the non-querier switch turns to be the querier until it receives the IGMP Query message from the switch with a smaller IP address.

For IGMP-Router V2, you can configure other querier intervals using the following command:

Command	Purpose
<code>ip igmp querier-timeout <i>time</i></code>	Configures the interval for other queriers (unit: second).

For IGMP-Router V1, the interval of other queriers is useless. For IGMP-Router V3, the interval cannot be configured because it is decided by the protocol itself.

### 73.3.3 Configuring Maximum IGMP Response Time

For IGMP-Router V2 and IGMP-Router V3, special data field in the transmitted IGMP General Query message regulates the maximum response time of the IGMP host. That is, the IGMP host has to send the response

message before the regulated maximum response time expires, indicating that the General Query message is received. If the maximum response time is set to a big value, the change of multicast group members delays. If the maximum response time is set to a small value, the flow of the IGMP message will be increased in the current network.

**Note:**

The maximum IGMP response time must be shorter than the IGMP query interval. If the value of the maximum response time is bigger than the query interval, the system will automatically set the maximum response time to **query-interval – 1**.

For IGMP-Router V2 and IGMP-Router V3, run the following command in interface configuration mode to set the maximum IGMP response time:

Command	Purpose
<code>ip igmp query-max-response-time time</code>	Configures the maximum IGMP response time (unit: second).

For IGMP-Router V1, the maximum IGMP response time is decided by the protocol itself. Therefore, the previous command is useless to IGMP-Router V1.

### 73.3.4 Configuring IGMP Query Interval for the Last Group Member

For IGMP-Router V2 and IGMP-Router V3, When the Group Specific Query message for a specific multicast group is sent, the query interval of the last group member will be used as the maximum response time of the host. That is, the IGMP host has to send the response message before the maximum response time of the last group member expires, indicating that the Group Specific Query message is received. If the IGMP host finds that it need not respond to the query message, it will not respond to the message after the interval. In this case, the multicast switch is to update the saved multicast group member information. If the query interval of the last group member is set to a big value, the change of the multicast group member delays. If the query interval of the last group member is set to a small value, the flow of the IGMP message is to increase in the current network.

For IGMP-Router V2 and IGMP-Router V3, run the following command in interface configuration mode to configure the IGMP query interval of the last group member:

Command	Purpose
<code>ip igmp last-member-query-interval time</code>	Configures the IGMP query interval of the last group member (unit: ms).

The previous command is useless for IGMP-Router V1.

### 73.3.5 Static IGMP Configuration

Besides the functions regulated by the IGMP-Router protocol, BODCOM's switches support the static multicast group configuration on the port. For the IGMP host, its multicast group member relationship may vary. Suppose the IGMP host only belongs to the multicast group **group1**, it receives the multicast message from and sends the multicast message to the multicast group **group1**. After a period of time, it may belong to the multicast group **group2**, and receives the multicast message from and sends the multicast message to the multicast group **group2**. After another period of time, the IGMP host may not belong to any multicast group. Therefore,

the multicast group assignment information varies.

Different the above “dynamic multicast group”, if a port is configured to belong to a static multicast group, the multicast routing protocol then takes the port as one that always receives and sends the multicast message of the multicast group. To be better compatible with IGMP-Router V3, the static multicast group can be configured to receive the multicast message from the designated source address, that is, the source-filter function is added when the multicast message is received.

Run the following command in interface configuration mode to configure the static multicast group for a port:

Command	Purpose
<code>ip igmp static-group { *   group-address} {include source-address   &lt;cr&gt; }</code>	Configures the static multicast group attribute for a port.

### 73.3.6 Configuring the IGMP Immediate-leave List

If IGMP V2 is started up on a port of the switch and the network that the port connects has only one IGMP host, you can realize the Immediate Leave function of the IGMP host by configuring the **IGMP Immediate-leave** list. According to the regulations of IGMP V2, when a host leaves a specific multicast group, the host will send the Leave message to all multicast switches. After receiving the Leave message, the multicast switches send the Group Specific message to confirm whether any multicast message to be received from or sent to the multicast group by the host exists on the port. If the Immediate Leave function is configured, no message need be interacted between the IGMP host and the multicast switch, the change of the multicast group member IDs will not be delayed.

**Note:**

The command can be configured both in global configuration mode and in interface configuration mode. The priority of the command configured in global configuration mode is higher than that configured in interface configuration mode. If the command is first configured in global configuration mode, the command configured in interface configuration mode will be omitted. If the command is first configured in interface configuration mode, the command configured in global configuration mode will delete the command configured in interface configuration mode.

For IGMP-Router V2, run the following command in interface configuration mode to configure the **IGMP Immediate-leave** list:

Command	Purpose
<code>ip igmp immediate-leave group-list list-name</code>	Configures the access list that realizes the function to immediately leave the multicast group for the IGMP host.
<code>ip access-list standard list-name</code>	Creates a standard IP access list named <b>list-name</b> .
<code>permit source-address</code>	Configures the IP address for the IGMP host that will realize the immediate-leave function in standard access-list configuration mode.

The previous command is invalid to IGMP-Router V1 and IGMP-Router V3.

## 73.4 IGMP Characteristic Configuration Example

All configurations about the IGMP characteristics are performed in VLAN port.

## Example for changing the IGMP version

The IGMP-Router protocol of latter version is compatible with the IGMP host of low version, but cannot be compatible with the IGMP-Router protocol of the earlier version. Therefore, if, there are switches running the IGMP-Router protocol of the earlier version in the current network, you need to change the IGMP-Router protocol of latter version to the IGMP-Router protocol of earliest version in the same network segment.

Suppose the administrator knows that switches running IGMP-Router V1 and IGMP-Router V2 exist in a network that the local switch connects, the administrator needs to change the version of the IGMP-Router protocol from version 2 to version 1 on a port of the switch that runs IGMP-Router V2.

```
interface ethernet 1/0  
ip igmp version 1
```

## IGMP query interval configuration example

The following example shows how to modify the IGMP query interval to 50 seconds on the interface **ethernet 1/0**:

```
interface ethernet 1/0
ip igmp query-interval 50
```

## IGMP Querier interval configuration example

The following example shows how to modify the IGMP Querier interval to 100 seconds on the interface **ethernet 1/0**:

```
interface ethernet 1/0
ip igmp querier-timeout 100
```

## Maximum IGMP response time example

The following example shows how to modify the maximum IGMP response time to 15 seconds on the interface **ethernet 1/0**:

```
interface ethernet 1/0
ip igmp query-max-response-time 15
```

## Example for configuring IGMP query interval for the last group member

The following example shows how to modify the IGMP query interval of the last group member to 2000 ms on the interface ethernet 1/0:

```
interface ethernet 1/0
ip igmp last-member-query-interval 2000
```

## Static IGMP configuration example

The configuration command of the static multicast group can define different classes of static multicast groups by adopting different parameters. The following examples shows the results of running different command parameter.

```
interface ethernet 1/0
ip igmp static-group *
```

The previous configuration command configures all static multicast groups on the interface ethernet 1/0. The multicast routing protocol is to forward all IP multicast messages to the interface ethernet 1/0.

```
interface ethernet 1/0
ip igmp static-group 224.1.1.7
```

The previous configuration command configures the static multicast group 224.1.1.7 on the interface ethernet 1/0, that is, the interface belongs to the multicast group 224.1.1.7. The multicast routing protocol is to forward all IP multicast messages that are finally sent to the multicast group 224.1.1.7 to the interface ethernet 1/0.

```
interface ethernet 1/0
ip igmp static-group 224.1.1.7 include 192.168.20.168
```

The previous configuration command configures the static multicast group 224.1.1.7 on the interface ethernet 0/0, and defines source-filter of the multicast group as 192.168.20.168. That is, the interface belongs to the multicast group 224.1.1.7, but it only receives the IP multicast messages from 192.168.20.168. The multicast routing protocol is to forward IP multicast messages that are received from 192.168.20.168 and finally sent to the multicast group 224.1.1.7 to the interface ethernet 0/0.

Run the following command in interface configuration mode to receive the IP multicast message that is from 192.168.20.169 and finally sent to the multicast group 224.1.1.7:

```
ip igmp static-group 224.1.1.7 include 192.168.20.169
```

The previous command can be executed for many times to define different source addresses.

### Note:

In a multicast group, the multicast group information cannot be simultaneously configured both for a specific source address and for all source addresses. The command used in the later configuration will be omitted. For example, If you run the command **ip igmp static-group 224.1.1.7 include 192.168.20.168** after the command **ip igmp static-group 224.1.1.7** is executed, the command **ip igmp static-group 224.1.1.7 include 192.168.20.168** will be omitted.

## IGMP Immediate-leave list configuration example

The following example shows how to set the access list to **imme-leave** on the interface ethernet 1/0 with the **immediate-leave** function and to add the IP address 192.168.20.168 of the IGMP host to the access list. The configuration ensures that the IGMP host with IP address 192.168.20.168 realizes the **immediate-leave** function.

```
interface ethernet 1/0
ip igmp immediate-leave imme-leave
exit
ip access-list standard imme-leave
permit 192.168.20.168
```

# Chapter 74 PIM-DM Configuration

## 74.1 PIM-DM Introduction

Protocol Independent Multicast Dense Mode (PIM-DM) is a multicast routing protocol in dense mode. By default, when the multicast source starts to send the multicast data, all network nodes in the domain receive the data. Therefore, PIM-DM forwards the multicast packets in broadcast-pruning mode. When the multicast source starts to send data, the switches alongside forward the multicast packets to all PIM-activated interfaces except the RPF interface. In this way, all network nodes in the PIM-DM domain can receive these multicast packets. To finish the multicast forwarding, the switches alongside need create the corresponding multicast routing item (S,G) for group G and its source S. The routing item (S,G) includes the multicast source address, multicast group address, incoming interface, outgoing interface list, timer and logo.

If there is no multicast group member in a certain network segment, PIM-DM will send the pruning information, prune the forwarding interface connecting the network segment and then establish the pruning state. The pruning state corresponds to the timeout timer. When the timer times out, the pruning state turns to be the forwarding state again and the multicast data can be forwarded along these branches. Additionally, the pruning state contains information about the multicast source and the multicast group. When the multicast group member appears in the pruning area, PIM-DM actively sends the graft message to the upper field without waiting for the pruning state of the upper field to time out, turning the pruning state to the forwarding state.

As long as source S still sends information to group G, the first-hop switch will periodically send the refreshing information of the routing item (S,G) to the nether original broadcast tree to finish refreshing. The state refreshing mechanism of PIM-DM can refresh the state of the downstream, ensuring that the pruning of the broadcast tree does not time out.

In the multi-access network, besides the DR selection, PIM-DM also introduces the following mechanisms:

- Use the assertion mechanism to select the unique forwarder to prevent the multicast packet from being repeatedly forwarded.
- Use the add/prune restraint mechanism to reduce redundant add/prune information.
- Use the pruning deny mechanism to deny improper pruning actions.

In the PIM-DM domain, the switches that run PIM-DM periodically send the Hello information to achieve the following purposes:

- Discover neighboring PIM switches.
- Judge leaf networks and leaf switches.
- Select the designated router (DR) in the multi-access network.

To be compatible with IGMP v1, PIM-DM is in charge of the DR choice. When all PIM neighboring routers on the interface support DR Priority, the neighboring router with higher priority is selected as the DR. If the priority is the same, the neighboring router with the maximum interface IP value is selected as the DR. If the priority is not shown in the Hello message of multiple routers, the router whose interface has the biggest IP value is selected as the DR.

The PIM-DM v2 of DBCOM's switches supports the neighbor filtration list, CIDR, VLSM and IGMP v1-v3.

## 74.2 Configuring PIM-DM

### 74.2.1 Modifying Timer

The routing protocol adopts several timers to judge the transmission frequency of Hello message and state-refresh control message. The interval to transmit the Hello message affects whether the neighbor relationship can be correctly created.

Run the following commands in switch configuration mode to regulate the timer:

Command	Purpose
<b>ip pim-dm hello-interval</b>	Sets the interval (unit: second) to send the Hello message from the interface and the neighbor.
<b>ip pim-dm state-refresh origination-interval</b>	For the first-hop switch directly connecting the source, the interval to send the state-refresh message is only valid to the configurations at the upstream ports. For the following switches, the interval is the period to receive and handle the state-refresh message.

### 74.2.2 Designating the Version Number

PIM-DM of the router only supports PIM v2.

As PIM v1 is out of date, we support PIM v2 by default. The command here only aims to be compatible with the former in style.

Command	Purpose
<b>ip pim-dm version <i>version</i></b>	Configures PIM-DM version on the switch logical port.

### 74.2.3 Configuring State-Refresh

The state-refresh control information of the PIM-DM is forwarded in management mode by default. The configuration commands in interface configuration mode are effective only to the configurations at the upstream ports when the first-hop switch directly connecting the source sends the state-refresh message periodically. For the following switches, the interval is the period to receive and handle the state-refresh message.

Command	Purpose
<b>no ip pim-dm state-refresh disable</b>	Allows to send and receive the state-refresh message on the port.
<b>ip pim-dm state-refresh origination-interval</b>	Configures the interval to send and receive the state-refresh message on the port.

### 74.2.4 Configuring Filtration List

PIM-DM does not set the filtration list by default. The referred filtration list includes the neighbor filtration list and the multicast boundary filtration list. The filtration list requires to be configured in interface configuration

mode.

To forbid a switch or switches at a network segment to join in the PIM-DM negotiation, the neighbor filtration list need be configured. To forbid or permit some groups to pass the local region, the multicast boundary filtration list need be configured.

Command	Purpose
<b>ip pim-dm neighbor-filter</b>	Configures the neighbor filtration list.
<b>ip multicast boundary</b>	Configures the multicast boundary filtration list.

### 74.2.5 Setting DR Priority

To be compatible with IGMP v1, the DR choice is required. By default, the priority of the DR is set to **1**. When all PIM neighboring routers on the interface support DR Priority, the neighboring router with higher priority is selected as the DR. If the priority is the same, the neighboring router with the maximum interface IP value is selected as the DR. If the priority is not shown in the Hello message of multiple routers, the router whose interface has the biggest IP value is selected as the DR.

Run the following command in interface configuration mode:

Command	Purpose
<b>ip pim-dm dr-priority</b>	Configures the priority for the local DR on the designated port.

### 74.2.6 Clearing Item (S,G)

Normally, item (S,G) in the local MRT or the statistics value of the multicast message number forwarded through item (S,G) need be cleared. Run the following commands in management mode.

Command	Purpose
<b>clear ip mroute pim-dm</b> {*   <i>group</i> [ <i>source</i> ]}	Clears the item (S,G) in the local MRT. The operation is to delete all or part items of the local multicast routing table. Multicast message forwarding may be affected. The command is used to delete only the (S,G) items created by the PIM-DM multicast routing protocol on the upstream ports.
<b>clear ip pim-dm interface</b>	Resets the statistics value of multicast message forwarded by (S,G) on the PIM-DM port. The command is used to reset only the (S,G) items created by the PIM-DM multicast routing protocol on the upstream ports.

## 74.3 PIM-DM State-Refresh Configuration Example

Refer to section 4.2.2 “Configuring State-Refresh”.

# Chapter 75 Configuring PIM-SM

## 75.1 PIM-SM Introduction

Protocol Independent Multicast Sparse Mode (PIM-SM) is a multicast routing protocol in sparse mode. In the PIM-SM domain, the switches that run PIM-SM periodically send the Hello information to achieve the following purposes:

- Discover neighboring PIM-SM switches.
- Select the designated router (DR) in the multi-access network.

The DR sends the join/prune message to the directly-connected group members at the direction of multicast distribution tree, or sends the data of the directly-connected multicast source to the multicast distribution tree. PIM-SM forwards the multicast packet by creating the multicast distribution tree. The multicast distribution tree can be classified into two groups: Shared Tree and Shortest Path Tree. Shared Tree takes the RP of group G as the root, while Shortest Path Tree takes the multicast source as the root. PIM-SM creates and maintains the multicast distribution tree through the displayed join/prune mode. As shown in Figure 5-1, when the DR receives a Join message from the receiving side, it will multicast a (\*, G)-join message at each hop towards the RP of group G to join in the shared tree. When the source host sends the multicast message to the group, the packet of the source host is packaged in the registration message and unicast to the RP by the DR; The RP then sends the unpackaged packet of the source host to each group member along the shared tree; The RP sends the (S,G)-join message to the first-hop switch towards the source's direction to join in the shortest path tree of the source; In this way, the packet of the source will be sent to the RP along the shortest path tree without being packaged; When the first multicast data arrives, the RP sends the registration-stop message to the DR of the source and the DR stops the registration-packaged process. Afterwards, the multicast data of the source is not packaged any more, but it will be sent to the RP along the shortest path tree of the source and then sent to each group member by the RP along the shared tree. When the multicast data is not needed, the DR multicasts the Prune message hop by hop towards the RP of group G to prune the shared tree.

PIM-SM also deals with the RP choice mechanism. One or multiple candidate BSRs are configured in the PIM-SM domain. You can select a BSR among candidate BSRs according to certain regulations. Candidate RPs are also configured in the PIM-SM domain. These candidate RPs unicast the packets containing RP's address and multicast groups to the BSR. The BSR regularly generates the Bootstrap message containing a series of candidate RPs and corresponding group addresses. The Bootstrap message is sent hop by hop in the whole domain. The switch receives and stores the Bootstrap message. After the DR receives a report about a group member's relationship from the directly-connected host, if the DR has no the routing item of the group, the DR will map the group address to a candidate RP through the Hash algorithm. The DR then multicasts the Join/prune message hop by hop towards the RP. Finally, the DR packages the multicast data in the registration message and unicasts it to the RP.

## 75.2 Configuring PIM-SM

### 75.2.1 Enabling Global Multicast

Command:

```
ip multicast-routing  
no ip multicast-routing
```

If you want to use the protocol pim-sm, run the command in the configuration mode:

```
switch_config#ip multicast-routing
```

Show running as follows:

```
!  
ip multicast-routing  
!
```

If you don't want to use the protocol pim-sm, run the command in the configuration mode:

```
switch_config #no ip multicast-routing
```

### 75.2.2 Starting up PIM-SM

Run the following command to run PIM-SM on the interface to activate the multicast function in sparse mode:

Command	Purpose
<code>ip pim-sm</code>	Enters the interface where PIM-SM needs to be run and activates the PIM-SM multicast routing process in interface configuration mode.

### 75.2.3 Configuring Neighbor Filter List

pim-sm needs to maintain neighbor relation in work. pim-sm finishes negotiation of the detection and related parameters through Hello information. Pim-sm forwards pim-sm hello packet by multicast periodically to all pim routers (224.0.0.13) and set up the neighbor relation by receiving hello information and agreed parameters. If one router receives Hello information before forwarding Hello information, the router will deem existence of the neighbor, otherwise, it will deem no existence of the neighbor.

Configure the neighbor filter list on the corresponding interface and check and filter the neighbor for the hello packet. If the neighbor filter list is deleted or the forbidden neighbor is relived just now, the neighbor information can only be acquired when the next hello period is appeared.

#### Steps for configuring neighbor access list:

1. Configure main ip address on the interface;
2. Port protocol up
3. Configure pim-sm on the interface;
4. Configure pim-sm standard access list on the interface and filter the neighbor.

#### Configuration instances:

```
switch_config#interface v9  
switch_config_v9#ip address 172.20.21.172 255.255.255.0  
switch_config_v9#ip pim-sm
```

```

switch_config_v9#ip pim-sm nbr-filter nbr_permit
switch_config_v9#exit
switch_config#ip access-list standard nbr_permit
switch_config_std_nacl#permit 172.20.21.174 255.255.255.0

```

Configuration result: enable hello packets from segment 172.20.21.0/24 and set up neighbor relation.

```
R172_config_std_nacl#show ip pim-s nei
```

PIM-SMv2 Neighbor Table

Neighbor Address	Interface	Uptime/Expires	DR Prior
172.20.21.173	v9	00:15:24/00:01:30	1(DR)

Change the configuration as follows and the interface v9 only enables hello packets from 172.20.21.174.

```
S172_config_std_nacl#permit 172.20.21.174 255.255.255.255
```

The debug information is as follows:

```
2004-1-1 00:16:26 PIM-SM: rcvd hello from 172.20.21.173, filter by acl
```

The former established neighbor will be aged gradually until timeout:

```
S172#show ip pim-s nei
```

PIM-SMv2 Neighbor Table

Neighbor Address	Interface	Uptime/Expires	DR Prior
172.20.21.173	v9	00:17:21/00:00:03	1(DR)

## 75.2.4 DR Election

DR election is to select DR for the router segment by comparing the priority and IP address in the Hello packets of each router.

The role of DR plays:

1. For response on the host IGMP(v1) information, if the host connects two or more PIM-SM routers directly by the Ethernet, only DR informs these information and forwards packets (\*,g) join. If DR and assert winner on the receiver end confronts, the former prevails.
2. DR on the multicast source generates original registration packets and register to RP.

If a new neighbor is found, DR is responsible for forwarding the local memorized BSM packets.

If the local tries to become DR, enhance the local DR priority and IP address value in condition of the same DR priority.

### Steps for configuring DR priority:

- Configures main ip address on the interface;
- Port protocol up;
- Configure pim-sm on the interface;
- Configure ip pim-sm dr-pri \*\* on the interface;

## 75.2.5 Configuring Candidate RP

Configure the candidate RP to enable it to be sent to the BSR periodically and then be diffused to all PIM-SM routers in the domain, ensuring the RP mapping is unique.

Run the following command in global configuration mode:

Command	Purpose
<b>ip pim-sm rp-candidate</b> <i>[type number] [interval group-list acl-name]</i> <b>no ip pim-sm rp-candidate</b> <i>[type number]</i>	Configures the local switch as the candidate RP. After the candidate RP is configured, it will be sent to the BSR periodically. The BSR then broadcasts all PIM-SM routers in the PIM-SM domain.

## 75.2.6 Configuring Candidate BSR

The configuration of the candidate RP can generate the unique global BSR in the PIM-SM domain. The global BSR collects and distributes the RP in the domain, ensuring the RP mapping is unique.

Run the following command in global configuration mode:

Command	Purpose
<b>ip pim-sm bsr-candidate</b> <i>type number [hash-mask-length] [priority]</i> <b>no ip pim-sm bsr-candidate</b> <i>type number</i>	Configures the local switch as the candidate BSR, and competes the global BSR by learning the BSM message.

## 75.2.7 Configuring SPT-threshold

When the data is forwarded on the switch, it needs to judge whether shift RPT to SPT. The evidence for this judge is spt-threshold. By default SPT switches if the receiver receives the first data packet. We can set the threshold of RPT switching to SPT; unit: KB/s. In general if RPT switches to SPT, there is no return.

```
switch_config#router pim-sm
switch_config_ps#spt-threshold 1000
```

## 75.2.8 Configuring SSM

SSM model needs support of IGMPv3 and enables IGMPv3 on the PIM-SM device of the receiver. SSM model can be realized by the subset function of pim-sm and the system enables functions of PIM-SM and SSM. When deploying pim-sm, it is recommend to enable pim-sm on all non-boundary interfaces.

During the process of transmitting the information of multicast source to the receiver, whether pim-ssm or pim-sm is determined by whether the multicast group of the receiver prescribed channel (S, G) exists within the multicast group of pim-ssm. Interfaces which enables pim-sm will deem the multicast group within the range adopting the model "pim-ssm".

Before configuring the basic functions of pim-ssm, the unicast route needs to be configured first, which ensures the interaction of the inner network layer and available route.

Steps for configuring pim-ssm:

- 3) Enable pim-sm on the interface;
- 4) Enter pim-sm configuration mode and address range of SSM group address;
- 5) Configure other functions of pim-sm (optional).

Configuration instances:

```
switch_config#interface v8
switch_config_v8#ip addr 1.1.1.1 255.255.255.0
switch_config_v8#ip pim-sm
switch_config_v8#exit
switch_config#router pim-sm
switch_config_ps#ssm rang grp_range
switch_config_ps#exit
switch_config#ip access-list standard grp-range
switch_config_std_nacl#permit 233.1.0.0 255.255.0.0
switch_config_std_nacl#
```

The following configuration does not take the default 232.0.0.0/8 as the group range of SSM, but 233.1.0.0/8. If SSM is canceled, disable ssm related configuration with “no” in the configuration mode of pim-sm.

## 75.2.9 Configuring Management Domain sz

In the mechanism of non-management domain, one pim-sm domain only has an exclusive BSR. The whole network is controlled by the BSR. For better management, the whole pim-sm domain can be divided into many management domains: each management domain maintains one BSR respectively and serves the multicast group within a certain range; global domain also maintains one BSR, which serves all left multicast groups.

In the mechanism of management domain, the boundary of each management domain is consisted of ZBR and each management domain maintains one BSR, which serves the multicast group of a certain range. The packets(such as assert message and BSR BootStrap message) of multicast protocol belonging to this range cannot pass the boundary of the management domain.

In the network which applies the management domain mechanism, select BSR for different multicast groups from C-BSR. C-RP within the network only forward inform packets to the corresponding BSR and BSR summarizes these packets on RP-SET and inform all devices within the service management domain.

For a group, if you want to find its rp, find sz corresponding to this group based on the longest prefix and sub-mask prevails; and find the corresponding RP-SET in sz according to the prefix and sub-mask of the group, and then calculate rp.

Steps for configuring management domain:

第1章 On management boundary device ZBR, configuring the range of local management domain group.

第2章 In the management domain, enter the configuration of pim-sm:

- 2.1.1 Configure the group range of standby BSR and keep consistent with the management domain boundary.

## 2.1.2 Configure standby BSR and designate standby BSR port.

### Configuration instances:

1. Configure the management domain range on ZBR

```
Sa_config_v9#ip pim-sm admin-scope 225.1.1.0 255.255.255.0
```

### 第3章 Configure the group range and port of standby BSR on domain pim-sm device

```
Sb_config#interface loopback1
```

```
Sb_config_l1#ip addr 1.1.1.1 255.255.255.0
```

```
Sb_config_l1#ip pim-sm
```

```
Sb_config#router pim-sm
```

```
Sb_config_ps#c-bsr admin-scope 225.1.1.0 255.255.255.0 30 200
```

```
Sb_config_ps#c-bsr loopback1 32 250
```

30,32 means the sub-mask length of hash, and 200, 250 means standby BSR priority. When there is inconsistency, the designated value when configuring standby BSR is superior to that of configuring management domain.

## 75.2.10 Configuring Source Address of Registered Packets

By default, when DR on the data source forwarding register packets, the address with DR will be taken as the source address of the registered packets. We can designate any active pim-sm interface on the DR device as the source address of the registered packets.

### Configuration instances:

```
Sb_config#interface loopback1
```

```
Sb_config_l1#ip addr 1.1.1.1 255.255.255.0
```

```
Sb_config_l1#ip pim-sm
```

```
Sb_config#router pim-sm
```

```
Sb_config_ps# reg-src loopback 1
```

Designate the main address of loopback1 as the source address of the registered packets.

## 75.2.11 Configuring anycast-rp

An individual RP has a great load in the domain of pim-sm. To lower such burden, we can designate many same rp. The multicast source and the receiver will forward registered packets and join requests based on the latest rp.

If there is no MSDP module introduced, the neighbor of anycast-rp must be clearly specified when configuring anycast-rp and the neighbor address and the port address acting as rp cannot be the same.

Refer to *Pim-sm Command Manual* for configuration instances.

## 75.2.12 Displaying PIM-SM Multicast Route

Run the following command to check the multicast route information learned by PIM-SM:

Command	Purpose
<code>show ip mroute pim-sm [group-address] [source-address] [type number] [summary] [count] [active kbps]</code>	Displays the PIM-SM multicast route information.

## 75.2.13 Clearing Multicast Routes Learned by PIM-SM

Run the following command to clear multicast routes learned by PIM-SM:

Command	Purpose
<code>clear ip mroute pim-sm [*   group-address] [source-address]</code>	Clears information about the PIM-SM multicast routes.

## 75.3 Configuration Example

### 75.3.1 PIM-SM Configuration Example (The switch is configured on the VLAN port)

The following examples show how two switches learn and forward the PIM-SM multicast routes.

Device A:

```

!
ip multicast-routing
!
interface Loopback0
ip address 192.166.100.142 255.255.255.0
ip pim-sm
!
interface Ethernet1/1
ip address 192.166.1.142 255.255.255.0
ip pim-sm
ip pim-sm dr-priority 100
!
interface Serial2/0
ip address 192.168.21.142 255.255.255.0
physical-layer speed 128000
ip pim-sm
!
router rip
network 192.168.21.0
network 192.166.1.0
network 192.166.100.0
version 2
!
ip pim-sm bsr-candidate Loopback0 30 201
ip pim-sm rp-candidate Loopback0
!

```

Device B:

```

!
ip multicast-routing
!
interface Ethernet0/1
ip address 192.168.200.144 255.255.255.0
ip pim-sm
ip pim-sm dr-priority 200

```

```

!
interface Serial0/0
ip address 192.168.21.144 255.255.255.0
ip pim-sm
!

```

## 75.3.2 BSR Configuration Example (The switch is configured on the VLAN port)

The following example shows the BSR configuration of two switches.

Device A:

```

!
ip multicast-routing
!
interface Loopback0
ip address 192.166.100.142 255.255.255.0
ip pim-sm
!
interface Ethernet1/1
ip address 192.166.1.142 255.255.255.0
ip pim-sm
!
interface Serial2/0
ip address 192.168.21.142 255.255.255.0
physical-layer speed 128000
ip pim-sm
!
router rip
network 192.168.21.0
network 192.166.100.0
!
ip pim-sm bsr-candidate Loopback0 30 201

```

!

Device B:

```

!
ip multicast-routing
!
interface Loopback0
ip address 192.168.100.144 255.255.255.0
ip pim-sm
!
interface Ethernet0/1
ip address 192.168.200.144 255.255.255.0
ip pim-sm
!
interface Serial0/0
ip address 192.168.21.144 255.255.255.0
ip pim-sm
!
ip pim-sm bsr-candidate Loopback0 30
!

```

# Chapter 76 IPv6 Protocol's Configuration

## 76.1 IPv6 Protocol's Configuration

The configuration of the IPv6 address of the router only takes effect on the VLAN interface, not on the physical interface.

The IPv6 protocol is disabled in default state. If the IPv6 protocol need be used on a VLAN interface, this protocol should be first enabled in VLAN interface configuration mode. To enable the IPv6 protocol, users have to set the IPv6 address. If on a VLAN interface at least one IPv6 address is set, the VLAN interface can handle the IPv6 packets and communicates with other IPv6 devices.

To enable the IPv6 protocol, users should finish the following task:

- Setting at least one IPv6 address in VLAN interface configuration mode

## 76.2 Enabling IPv6

### 76.2.1 Setting the IPv6 Address

The IPv6 address is used to determine the destination address to which the IPv6 packets can be sent. There are three kinds of IPv6 addresses.

Kind	Referred Format	Remarks
Unicast address	2001:0:0:0:0DB8:800:200C:417A/6 4	<b>2001:0:0:0:0DB8:800:200C:417A</b> stands for a unicast address, while <b>64</b> stands for the length of the prefix of this address.
Multicast address	FF01:0:0:0:0:0:0:101	All multicast addresses begin with FF.
Any address	2002:0:0:0:0DB8:800:200C:417A/6 4	The format of this address is the same as that of the unicast address. Different VLAN interfaces can be set to have the same address, no matter it is a unicast/broadcast/multicast address.

For the further details of the IPv6 address, see RFC 4291.

In order to enable IPv6, users must set a unicast address in VLAN interface configuration mode. The set unicast address must be one or multiple addresses of the following type:

- IPv6 link-local address
- Global IPv6 address

To set an IPv6 link-local address in VLAN interface configuration mode, run the following commands.

Command	Purpose
ipv6 enable	Sets a link-local address

	automatically.
ipv6 address fe80::x link-local	Sets a link-local address manually.

**Note:**

- The link-local address must begin with fe80. The default length of the prefix is 64 bit. At manual settings only the values at the last 64 bits can be designated.
- On a VLAN interface can only one link-local address be set.
- After IPv6 is enabled through the configuration of the link-local address, IPv6 only takes effect on the local link.

To set a global IPv6 address in VLAN interface configuration mode, run the following commands.

Command	Purpose
ipv6 address autoconfig	Sets a global address automatically.
ipv6 address [ipv6-address/prefix-length   prefix-name sub-bits/prefix-length]   [eui-64]	Sets a global address.
ipv6 address X:X:X:X::X/<0-128> anycast	Sets an address of unicast/broadcast/multicast.

**Note:**

- (17) When IPv6 is enabled through the configuration of a global address, all interconnected IPv6 device can be handled by IPv6.
- (18) If a link-local address has not been set before the configuration of the global address, the system will set a link-local address automatically.

# Chapter 77 Setting the IPv6 Services

## 77.1 Setting the IPv6 Services

After IPv6 is enabled, all services provided by IPv6 can be set. The configurable IPv6 service is shown below:

- (1) Managing the IPv6 Link

### 77.1.1 Managing the IPv6 Link

IPv6 provides a series of services to control and manage the IPv6 link. This series of services includes:

- (1) Setting the transmission frequency of the ICMPv6 packet
- (2) Setting the source IPv6 route
- (3) Setting the MTU of IPv6
- (4) Setting IPv6 redirection
- (5) Setting IPv6 destination unreachability
- (6) Setting IPv6 ACL
- (7) Setting IPv6 Hop-Limit

#### Setting the transmission frequency of the ICMPv6 packet

If you want to limit the transmission frequency of the ICMPv6 packet, run the command in the following table. If the ICMPv6 transmission frequency is larger than the set value, the transmission frequency will be limited.

The default transmission frequency is 1000us. If you want to modify the transmission frequency, run the following command in global mode:

Command	Purpose
<code>ipv6 icmp6-ratelimit <i>ratelimit</i></code>	Sets the transmission frequency of the ICMPv6 packet.

#### Setting the source IPv6 route

IPv6 allows a host to designate the route of an IPv6 network, that is, the source route. The host can realize the source route through using the routing header in the IPv6 packets. The router can forward packets according to the routing header, or desert this kind of packets considering security.

The router supports the source route by default. If the source route is closed, users can run the following command in global configuration mode to open the source route.

Command	Purpose
<code>ipv6 source-route</code>	Allows the source IPv6 route.

#### Setting the MTU of IPv6

All interfaces have a default IPv6 MTU. If the length of an IPv6 packet exceeds MTU, the router will fragment this IPv6 packet.

To set IPv6 MTU on a specific interface, run the following command in interface configuration mode:

COMMAND	Purpose
ipv6 mtu <i>bytes</i>	Sets IPv6 MTU on an interface.

### Setting IPv6 redirection

Sometimes, the route selected by the host is not the best one. In this case, when a switch receives a packet from this route, the switch will transmit, according to the routing table, the packet from the interface where the packet is received, and forward it to another router which belongs to the same network segment with the host. Under this condition, the switch will notify the source host of sending the packets with the same destination address to another router directly, not by way of the switch itself. The redirection packet demands the source host to replace the original route with the more direct route contained in the redirection packet. The operating system of many hosts will add a host route to the routing table. However, the switch more trusts the information getting from the routing protocol and so the host route will not be added according to this information.

IPv6 redirection is opened by default. However, if a hot standby router protocol is configured on an interface, IPv6 redirection is automatically closed. If the hot standby router protocol is canceled, this function will not automatically opened.

To open IPv6 redirection, run the following command:

COMMAND	Purpose
ipv6 redirects	Allows IPv6 to transmit the redirection packets.

### Setting IPv6 destination unreachability

In many cases, the system will automatically transmit the destination-unreachable packets. Users can close this function. If this function is closed, the system will not transmit the ICMP unreachable packets.

To enable this function, run the following command:

COMMAND	Purpose
ipv6 unreachable	Allows IPv6 to transmit the destination unreachable packets.

### Setting IPv6 ACL

Users can use ACL to control the reception and transmission of packets on a VLAN interface. If you introduce ACL on a VLAN interface in global configuration mode and designate the filtration's direction, the IPv6 packets will be filtered on this VLAN interface.

To filter the IPv6 packets, run the following command in interface configuration mode.

COMMAND	Purpose
ipv6 traffic-filter <i>WORD</i> { in   out }	Filters the IPv6 packets in the reception or transmission direction (in: receive; out: transmit) on a VLAN interface.

## 7. Setting IPv6 Hop-Limit

Users can designate a router to transmit the value of the hop-limit field in the packets (except those forwarded packets). All those packets that this router transmits out, if the upper-level application does not apparently designate a hop-limit value, use the set value of hop-limit. At the same time, the value of the hop-limit field is added to the RA packets that this router transmits.

The default hop-limit value is 64. If you want to change this value, you can run the following command in interface configuration mode.

COMMAND	Purpose
ipv6 cur-hoplimit <i>value</i>	<b>DESIGNATES A ROUTER TO TRANSMIT THE HOP-LIMIT FIELD OF THE PACKETS.</b>

# Chapter 78 Configuring the Routing Management Modules

## 78.1 Overview

The static route is a special route and configured by the administrator manually; after a static route is set the packets with a designated destination will be forwarded along the path that is designated by the administrator.

In those networks with simple networking structures, only the configuration of the static routes can realize network interconnection. Properly setting and using static routes can improve the performance of networks and guarantee the bandwidth for important network application.

The shortage of the static route is that it cannot automatically adapt to the change of the network topology. When the network has trouble or the topology changes, the static routes are unreachable and the network then interrupts. In this case, the network administrator has to change the settings of static routes manually.

If the data packets that reach a designated network cannot find the corresponding items in the routing table in a device, the device will then discard these data packets.

After a default route is configured on the current device, those data packets that have no corresponding items in the routing table will not be discarded by the current device but forwarded to another device, which will forward these data packets.

The default route is used only when a device has not found a matching entry in the routing table.

If the destination address of a packet does not match up any entry in the routing table, this packet will select the default route.

If there is no default route and the destination of the packet is not in the routing table, this packet will be discarded and an ICMPv6 packet will be sent back to the source terminal, reporting that the destination address and the network are unreachable.

The default routes can be generated in two ways:

The first way is that the network administrator sets a static route to network 0::0/0. As to an incoming data packet, if the current device cannot find the corresponding routing item in the routing table, it will forward this packet to the designated next-hop port that is set in the static route.

The second way is that the default route is generated by the dynamic routing protocols. A device with strong routing ability forwards the default route to other devices, and the other devices generate in their own routing tables the default route that is oriented to the device with strong routing ability.

## 78.2 Configuration Task List of Routing Management Module

The routing management module has the following configuration tasks:

- Setting the static route
- Setting the threshold of routes in a routing table
- Checking whether the next hop of the static route is reachable

## 78.3 Routing Management Module's Configuration Tasks

### 78.3.1 Setting the Static Route

To set the static route, run the following command in global configuration mode:

Command	Purpose
<b>ipv6 route</b> <i>prefix / prefixlen</i> { <i>ipv6-address</i>   <i>interface-type interface-number</i>	Sets the static route.

When setting the static route, you can designate the type and number of the outgoing interfaces, and also the address of the next hop. It depends on actual requirements whether to designate an outgoing interface or the next-hop address. The next-hop address cannot be the IPv6 address of the local address, or the static route is invalid.

When you run **IPv6 route** to set the static route, if the destination address and the mask are set to 0::0/0, the configured route is a default one. The **prefixlen** parameter in the configured prefix should be less than or equal to 64, or be equal to 128 (host's route).

Different management distances can be set for different static routes and therefore these static routes can be flexibly applied on the routing management modules.

The next hop of the configured static route must be activated, otherwise the static route cannot be activated. When the next hop is an interface or an interface VLAN, the interface must be a v6 one; when the next hop is a gateway, this gateway must be in the directly-connected network segment.

### 78.3.2 Setting the Threshold of Routes in a Routing Table

To a maximum number of routes in a routing table, that is, to set a threshold for routes in a routing table, run the following command in global configuration mode:

Command	Purpose
<b>ipv6 route max-number</b> <64-640000>	Sets the total number of routes, distributes systematic resources reasonably and

### 78.3.3 Monitoring and Maintaining the State of the Routing Table

To display all kinds of statistics information about routes, run the following commands in EXEC mode:

Comman	Purpos
<b>show ipv6 route</b>	Displays the information in the main
<b>show ipv6 route [protocol]</b>	Displays the routing information of the corresponding routing protocol in the
<b>show ipv6 route summary</b>	Displays the statistics information about the main routing table.
<b>show ipv6 fib route</b>	Displays the items in the main forwarding table, FIB.
<b>show ipv6 fib summary</b>	Displays the statistics information about the forwarding table.
<b>Show ipv6 route summary (line card)</b>	Displays the statistics information about the routing table on the wire
<b>Show ipv6 route information (line card)</b>	Displays the information about the current state on the wire card.
<b>Show ipv6 route [ delete   stale   un-lpm   no-lla   ipv6-address ] (line card)</b>	Displays all kinds of routing information on the wire card.

To trace all related events and information on the route management module, run the following commands in EXEC mode.

Command	Purpose
<b>debug ipv6 routing message</b>	Traces the reception and transmission of the
<b>debug ipv6 routing search</b>	Traces routing search.
<b>debug ipv6 routing timer</b>	Traces the IPv6 clock.
<b>Debug ipv6 routing redis</b>	Traces the IPv6-redistribute information.
<b>debug ipv6 fib cache</b>	Traces the IPv6-cache information.
<b>Debug ipv6 fib message</b>	Traces the information in the IPv6 forwarding
<b>Debug ipv6 routing exf (line card)</b>	Traces the EXF information that is added to

<b>Debug ipv6 routing packet (line card)</b>	Traces the packet interaction information between the wire card and the main-control
<b>Debug ipv6 routing message (line card)</b>	Traces the interaction information between
<b>Debug ipv6 routing cache (line card)</b>	Traces the information about the cache on
<b>Debug ipv6 routing route (line card)</b>	Traces the information about route change
<b>Debug ipv6 routing search (line card)</b>	Traces the routing search information on the

# 78.4 Static Route's Configuration Example

As shown in the following figure, RA directly connects router RB.

## RA configuration:

```
interface FastEthernet0/1 no ip
address
no ip directed-broadcast ipv6
address 3FFE::1/64
!
interface Ethernet1/1 no ip
address
no ip directed-broadcast duplex
half
ipv6 address 3333::1111/64
!
```

## RB configuration:

```
interface VLAN1 no ip
address
no ip directed-broadcast ipv6
address 3333::3333/64
!
!
```

## Browsing the address of the local link of RA:

```
RA_config#show ipv6 route
```

```
Codes: C - Connected, L - Local, S - Static, R - Ripng, B - BGP
```

```
ON1 - OSPF NSSA external type 1, ON2 - OSPF NSSA external type 2 OE1 - OSPF  
external type 1, OE2 - OSPF external type 2
```

```
DHCP - DHCP type VRF ID:
```

```
0
```

```
C 3333::/64[1]  
is directly connected, C,Ethernet1/1 C  
3333::1111/128[1]  
is directly connected, L,Ethernet1/1 C  
3ffe::/64[1]  
is directly connected, C,FastEthernet0/1
```

```

C    3ffe::1/128[1]
    is directly connected, L,FastEthernet0/1 C
    fe80::/10[1]
    is directly connected, L,Null0
C    fe80::/64[1]
    is directly connected, C,FastEthernet0/1 C
    fe80::a00:3eff:fed5:effc/128[1]
    is directly connected, L,FastEthernet0/1 C
    fe80::/64[1]
    is directly connected, C,Ethernet1/1 C
    fe80::a00:3eff:fed5:effd/128[1]
    is directly connected, L,Ethernet1/1 C
    ff00::/8[1]
    is directly connected, L,Null0

```

!

Setting a static route, which leads to subnet **3ffe::/64** on RB:

!

```
ipv6 route 3ffe::/64 3333::1111
```

!

Or:

!

```
ipv6 route 3ffe::/64 VLAN1 fe80::a00:3eff:fed5:effd
```

!

# Chapter 79 ND Configuration

## 79.1 ND Overview

A node (host and router) uses ND (Neighbor Discovery protocol) to determine the link-layer addresses of the connected neighbors and to delete invalid cache rapidly. The host also uses the neighbor to discover the packet-forwarding neighboring routers. Additionally, the node uses the ND mechanism to positively trace which neighbors are reachable or unreachable and to test the changed link-layer address. When a router or the path to a router has trouble, the host positively looks for another working router or another path.

IPv6 ND corresponds to IPv4 ARP, ICMP router discovery and ICMP redirect.

ND supports the following link types: P2P, multicast, NBMA, shared media, changeable MTU and asymmetric reachability. The ND mechanism has the following functions:

- (1) To discover routers: how the host to locate the routers on the connected links.
- (2) To discover prefixes: how the host to find a group of address prefixes, defining which destinations are on-link on the connected links.
- (3) To discover parameters: how the node to know the link-related or network-related parameters of the transmission interface.
- (4) To automatically set addresses: how the node to set the address of an interface automatically.
- (5) Address solution: When the IP of a destination is given, how a node determines the link-layer address of the on-link destination.
- (6) To determine the next hop: it is an algorithm to map the IP address of a destination to the neighboring IP. The next hop can be a router or destination.
- (7) To test unreachable neighbors: how a node to determine unreachable neighbors; if neighbor is a router, the default router can be used.
- (8) To test repeated address: how a node to determine whether a to-be-used address is not used by another node.
- (9) Redirect: how a router to notify the host of the best next hop.

## 79.2 Address Resolution

Address resolution is a procedure of resolving the link-layer address through node's IP. Packet exchange is realized through ND request and ND notification.

- Configuring a static ND cache

In most cases, dynamic address resolution is used and static ND cache configuration is not needed. If necessary, you can set static ND cache in global mode and the system will use it to translate IP into the link-layer address. The following table shows how to set a static-IP-to-link-layer-address mapping.

Run the following relative command in global mode:

Command	Purpose
<code>ipv6 neighbor ipv6address vlan vlanid</code>	Sets a static ND cache and translates IPv6

hardware-address	address into a link-layer address.
------------------	------------------------------------

## 79.3 ND Configuration

The ND protocol is used not only for address resolution but for other functions such as neighbor solicitation, neighbor advertisement, router solicitation, router advertisement and redirect.

The following commands are all run in port configuration mode:

- Setting the number of transmitted NSs when ND performs DAD on a local port

Before the IPv6 port is started, it should send the NS information to the local machine to find if there is any duplicate IPv6 address existing on links through DAD.

Command	Purpose
<b>ipv6 nd dad attempts</b> num	Sets the number of transmitted NSs when the local port performs DAD.

- Setting the M flag in the RA message transmitted by the local port

The M flag indicates that the RA message host should obtain addresses through on-status automatic configuration. To set the M flag in the RA message transmitted by the local port to 1, run the following command.

Command	Purpose
<b>ipv6 nd managed-flag</b>	Sets the M flag in the RA message transmitted by the local port.

- Setting the NS transmission interval of the local port and the **retrans-timer** field in the RA message

This command can be used to set the NS transmission interval of the local switch on the local port and at the same time the **retrans-timer** field in the RA message on the local port.

The host sets its **retrans-timer** variable according to the retrans-timer field in RA.

Command	Purpose
<b>ipv6 nd ns-interval</b> milliseconds	Means the NS retransmission interval in the local port and the retrans-timer field in the RA message. Its default value is 1000ms.

- Setting the O flag in the RA message transmitted by the local port

The O flag indicates that the RA message host should obtain other information through on-status automatic configuration. To set the O flag in the RA message transmitted by the local port to 1, run the following command:

Command	Purpose
<b>ipv6 nd other-flag</b>	Sets the O flag in the RA message transmitted by the local port.

- Setting the prefix of the RA message

The router releases address prefixes to the network host via RA message. The address prefix plus the host address is the entire unicast address. The prefix option is carried by the RA message, and

the host obtains the IPv6 address prefix and related parameter from this option.

Command	Purpose
<code>ipv6 nd prefix {ipv6-prefix/prefix-length   default} [no-advertise] [valid-lifetime preferred-lifetime [off-link   no-autoconfig]] ]</code>	Means that the local port transmits the prefix option's content in the RA message.

- Setting the RA transmission interval

The following command is used to set the range of RA transmission interval. The RA transmission interval is in general an indefinite value but a random value in a fixed range, which can avoid abrupt flow surge in the network.

Command	Purpose
<code>ipv6 nd ra-interval-range max min</code>	Sets the range of RA transmission interval. The maximum RA transmission interval is 600s and the minimum RA transmission interval is 200s.

The interval for the local port to transmit the first three messages cannot be more than 16 seconds, while that to transmit the following messages varies between the maximum interval (600 seconds) and the minimum interval (200 seconds).

- Setting a specific RA transmission interval

RA packets are transmitted in an interval configured by **ra-interval-range**, but if users want to use a specific transmission interval, they can set this value through the following command:

Command	Purpose
<code>ipv6 nd ra-interval interval</code>	Sets a specific RA transmission interval, which is not set by default.

- Setting the router-lifetime field in the RA message transmitted by the local port

The **router-lifetime** field in the RA message is the triple of the maximum value of **ipv6 nd ra-interval-range**.

Command	Purpose
<code>ipv6 nd ra-lifetime seconds</code>	Sets the router-lifetime field in the RA message transmitted by the local port.

- Setting the reachable-time field of the RA message

**reachable-time** means the time to reach a neighbor, which is 0 by default.

Command	Purpose
<code>ipv6 nd reachable-time milliseconds</code>	Sets the <b>reachable-time</b> field in the RA message transmitted by the local port. Its default value is 0ms.

- Setting the value of the router preference in the RA message

**router-preference** means the router's priority, which accounts for two bits in the **flags** domain in the RA message. The router's priority can be high, medium and low. The medium priority is the default settings.

Command	Purpose
<b>ipv6 nd router-preference</b> preference	Sets the <b>router-preference</b> field in the RA message transmitted by the local port. It is medium by default.

- Stopping a port to be the notification port of a switch

Only the notification port can transmit RA packets. The notification port supports multicast and is set to have at least one unicast IP address. Its AdvSendAdvertisement flag is TRUE in value.

The configuration of **ipv6 nd suppress-ra** in the VLAN port means shutdown the notification port.

This command is not set by default.

Command	Purpose
<b>ipv6 nd suppress-ra</b>	Means the value of the AdvSendAdvertisement flag on the local port. 0

# Chapter 80 OSPFv3 Configuration

## 80.1 Overview

OSPFv3 is an IGP routing protocol developed by the OSPF working group of IETF for the IPv6 network. OSPFv3 supports the IPv6 subnet, the mark of the external routing information and the packet's authentication. OSPFv3 and OSPFv2 have a lot in common:

- Both router ID and area ID are 32 bit.
- The following are the same type of packets: Hello packets, DD packets, LSR packets, LSU packets and LSAck packets.
- Having the same neighbor discovery mechanism and the same neighborhood generation mechanism
- Having the same LSA expansion mechanism and the same LSA aging mechanism

The main differences of both OSPFv3 and OSPFv2 are shown below:

- OSPFv3 is running on the basis of link, while OSPFv2 is running on the basis of network segment.
- OSPFv3 can run multiple instances on the same link.
- OSPFv3 labels its neighbor through router ID, while OSPFv2 labels its neighbor through IP.
- OSPFv3 defines 7 classes of LSAs.

The following table shows some key functions in the realization of the OSPFv3 functions.

Key attributes	Description
Stub domain	Supports the stub domain.
Route forwarding	Means that routes that are learned or generated by any routing protocol can be forwarded to the domains of other routing protocols. In the autonomous domain, it means that OSPFv3 can input the RIPng learned routes. The routes learned by OSPFv3 can also be exported to RIPng. Between the autonomous domains, OSPFv3 can import the BGP-learned routes; OSPFv3 routes can also be exported to the BGPs.
Parameters of a routing interface	The following are configurable interface parameters: output cost, retransmission interval, interface's transmission delay, router's priority, interval for judging the shutdown of a router, hello interval, and authentication key.
Virtual link	Supports the virtual link.

## 80.2 OSPFv3 Configuration Task List

OSPFv3 demands the switchover of routing data between in-domain router, ABR and ASBR. In order to simplify the settings, you can make related configuration to enable them to work under the default parameters without any authentication; if you want to change some parameters, you must guarantee that the parameters on all routers are identical.

To set OSPFv3, you must perform the following tasks. Except that the task of activating OSPFv3 is mandatory, other settings are optional.

- Enabling OSPFv3
- Setting the parameters of the OSPFv3 interface

- Setting OSPFv3 on different physical networks
- Setting the parameters of the OSPFv3 domain
- Configuring the NSSA Domain of OSPFv3
- Setting the Route Summary in the OSPFv3 Domain
- Setting the Summary of the Forwarded Routes
- Generating a Default Route
- Choosing the route ID on the loopback interface
- Setting the management distance of OSPFv3
- Setting the Timer of Routing Algorithm
- Monitoring and Maintaining OSPFv3

## 80.3 OSPFv3 Configuration Tasks

### 80.3.1 Enabling OSPFv3

Before OSPFv3 is enabled, the function to forward the IPv6 packets must be enabled.

Run the following commands in global configuration mode:

Command	Purpose
<b>router ospfv3</b> <i>process-id</i>	Activates OSPFv3 and enters the router configuration mode.
<b>router-id</b> <i>router-id</i>	Sets the router ID of a router on which OSPFv3 is running.

Run the following command in interface configuration mode:

Command	Purpose
<b>ipv6 ospf</b> <i>process-id area area-id [instance instance-id]</i>	Enables OSPFv3 on an interface.

Note: If the OSPFv3 process is still not created before OSPFv3 is enabled on an interface, the OSPFv3 process will be automatically created.

### 80.3.2 Setting the Parameters of the OSPFv3 Interface

During OSPFv3 realization, related OSPFv3 parameters on an interface are allowed to be modified according to actual requirements. Of course you have no need to change every parameter, but you have to make sure that some parameters are consistent on all routers in the connected networks.

Run the following commands in interface configuration mode to do relevant configurations:

Command	Purpose
<b>ipv6 ospf cost</b> <i>cost</i>	Sets the cost of the packet that is transmitted from the OSPFv3 interface.
<b>ipv6 ospf retransmit-interval</b> <i>seconds</i>	Sets the LSA retransmission interval between neighbors.
<b>ipv6 ospf transmit-delay</b> <i>seconds</i>	Sets the delay time for transmitting LSA on an OSPFv3 interface.
<b>ipv6 ospf priority</b> <i>number</i>	Sets a router to be the priority of the OSPFv3 DR

	router.
<b>ipv6 ospf hello-interval</b> <i>seconds</i>	Sets the interval for the OSPFv3 interface to transmit the Hello packets.
<b>ipv6 ospf dead-interval</b> <i>seconds</i>	Means that in a regulated interval if the OSPFv3 packets are not received from a neighboring router, this neighboring router is viewed to be shut down.

### 80.3.3 Setting OSPFv3 on Different Physical Networks

OSPFv3 divides physical network media into the following three kinds:

- Broadcast networks (Ethernet, Token Ring, FDDI)
- Non-broadcast and multi-access networks (SMDS, Frame Relay, X.25)
- Point-to-point networks (HDLC, PPP)

### 80.3.4 Setting the OSPF Network Type

No matter what physical media type the network is, you can configure your network to be a broadcast network, a non-broadcast network or a multi-access network. So you can set your network flexibly and your network can be set to be a non-broadcast and multi-access one, or a broadcast network such as the X.25, Frame Relay or SMDS network. Also the neighbor's settings will be simplified.

To set an un-broadcast and multi-access network is to suppose that every two routers have a virtual link or suppose a full-mesh network. It is unrealistic due to unbearable cost. But you set this network to be a point-to-multipoint one. Between those routers which are not adjacent the routing information can be switched through the virtual link.

The OSPFv3 point-to-multipoint interface can be set to be multipoint-to-point interface, through which multiple routes of a host can be established. The OSPFv3 point-to-multipoint network, comparing with the non-broadcast and multi-access network or the point-to-point network, has the following advantages:

- The point-to-multipoint network is easy to be set without generating DR.
- This kind of network do not require the full-mesh topology, so the construction cost is relatively low.
- This kind of networks are more reliable. Even if its virtual link fails, the connection can be maintained.

The network type of the routers is the broadcast type.

### 80.3.5 Setting the Parameters of the OSPFv3 Domain

The configurable domain parameters include: authentication, designating a stub area and specifying a weight for a default summary route. Its authentication is based on password protection.

The stub area means that external routes cannot be distributed to this area. Instead, ABR generates a default external route that enters the stub area, enabling the stub area to communicate with external networks of an autonomous area. In order to make use of the attributes supported by the OSPF stub, the default route must be used in the stub area. To further reduce LSAs that are forwarded to the stub area, you can forbid the summary function on ABR.

Run the following command in router configuration mode to set the domain's parameters:

Command	Purpose
<b>area</b> <i>area-id</i> <b>stub</b> [no-summary]	Defines a stub area.
<b>area</b> <i>area-id</i> <b>default-cost</b> <i>cost</i>	Sets the weight of the default route of the stub area.

As to those areas that are not backbone areas and do not connect the backbone areas directly or as to those discontinuous areas, the OSPFv3 virtual link can be used to establish a logic connectivity. In order to create a virtual link, you have to perform configuration at the two terminals of the virtual link. If only one terminal is configured, the virtual link cannot work.

Run the following command in router configuration mode to set the domain's parameters:

Command	Purpose
<b>area</b> <i>area-id</i> <b>virtual-link</b> <i>neighbor-ID</i> [ <b>dead-interval</b> <i>dead-value</i> ][ <b>hello-interval</b> <i>hello-value</i> ][ <b>retransmit-interval</b> <i>retrans-value</i> ][ <b>transmit-delay</b> <i>dly-value</i> ]	Establishes the virtual link.

### 80.3.6 Setting the Route Summary in the OSPFv3 Domain

With this function ABR can broadcast a summary route to other areas. In OSPFv3 ABR will broadcast each network to other areas. If network IDs are distributed to be continuous, you can set ABR to broadcast a summary route to other areas. The summary route can cover all networks in a certain range.

Run the following command in router configuration mode to set the address' range:

Command	Purpose
<b>area</b> <i>area-id</i> <b>range</b> <i>ipv6-prefix /prefix-length</i>	Sets the address' range of the summary route.

### 80.3.7 Setting the Summary of the Forwarded Routes

When routes are distributed from other routing areas to the OSPFv3 routing area, each route is singularly broadcasted as an external LSA. However, you can set a route on a router to make this route cover an address range. In this way, the size of the OSPFv3 link-state database can be reduced.

Run the following command in router configuration mode to set a summary route:

Command	Purpose
<b>summary-prefix</b> <i>ipv6-prefix /prefix-length</i>	Broadcasts only one summary route.

### 80.3.8 Generating a Default Route

ASBR should generate a default route to enter the OSPFv3 routing area. Whenever it is, you make configuration to enable a router to distribute a route to the OSPFv3 routing area and this route becomes ASBR automatically. However, ASBR does not generate a default route by default to enter the OSPFv3 routing area.

### 80.3.9 Choosing the Route ID on the Loopback Interface

OSPFv3 uses the maximum IPv4 address as its router ID. If the interface that connects the IPv4 address is

down or the IPv4 address is deleted, the OSPF process will recalculate the ID of this new router and retransmit the routing information from all interfaces.

If an IPv4 address is configured on a loopback interface, the router will first use the IPv4 address of loopback as its ID. Because the loopback interface will never be down, the routing table is greatly stable.

The router can first select the loopback interface as its ID or select the maximum IPv4 address in all loopback interfaces as its ID. If there is no loopback interface, the IPv4 address of a router will be used as the router ID. You cannot specify OSPFv3 to use any specific interface.

Run the following commands in global configuration mode to set the IP loopback interface:

Command	Purpose
<b>interface loopback <i>num</i></b>	Creates a loopback interface and enters the interface configuration mode.
<b>ip address <i>ip-address mask</i></b>	Distributes an IPv4 address for an interface.

### 80.3.10 Setting the Management Distance of OSPFv3

The management distance means the trust level of the routing information source. Generally speaking, the management distance is an integer between 0 and 255. The bigger its value is, the lower the trust level is. If the management distance is 255, the routing information source will be distrusted and omitted.

OSPFv3 uses three different kinds of management distances: inter-domain, inner-domain and exterior. The routes in a domain are called inner-domain routes; the routes to other domains are called inter-domain routes; the routes transmitted from other routing protocols are called the exterior routes. The default value of each kind of routes is 110.

### 80.3.11 Setting the Timer of Routing Algorithm

You can set the delay between receiving the topology change information and calculating SPF. You can also set the interval between two continuous SFP algorithm. Run the following command in router configuration mode:

Command	Purpose
<b>timers delay <i>delaytime</i></b>	Set a delay for routing algorithm in an area.
<b>timers hold <i>holdtime</i></b>	Sets a minimum interval for routing algorithm in an area.

### 80.3.12 Monitoring and Maintaining OSPFv3

The network statistics information which can be displayed includes the content of the IP routing table, caching and database. This kind of information can help users to judge the usage of network resources and solve network problems.

You can run the following commands to display all kinds of routing statistics information:

Command	Purpose
<b>show ipv6 ospf [<i>process-id</i>]</b>	Displays the general information about the OSPFv3 routing process.

<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>router</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>network</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>inter-prefix</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>inter-router</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>external</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>link</i> ] [ <i>adv-router router-id</i> ] <b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>intra-prefix</i> ] [ <i>adv-router router-id</i> ]	Displays the information about the OSPFv3 database.
<b>show ipv6 ospf interface</b>	Displays the information about the OSPFv3 interface.
<b>show ipv6 ospf neighbor</b>	Displays the information about OSPFv3 neighbors.
<b>show ipv6 ospf route</b>	Displays the routing information about OSPFv3.
<b>show ipv6 ospf topology</b>	Displays the OSPFv3 topology.
<b>show ipv6 ospf virtual-links</b>	Displays the virtual links of OSPFv3.
<b>debug ipv6 ospf</b>	Monitors all OSPFv3 behaviors.
<b>debug ipv6 ospf events</b>	Monitors the OSPFv3 events.
<b>debug ipv6 ospf ifsm</b>	Monitors the state machine of the OSPFv3 interface.
<b>debug ipv6 ospf lsa</b>	Monitors related behaviors about OSPFv3 LSA.
<b>debug ipv6 ospf nfsm</b>	Monitors the state machine of the OSPFv3 neighbors.
<b>debug ipv6 ospf nsm</b>	Monitors the information of which the management module notifies OSPFv3.
<b>debug ipv6 ospf packet</b>	Monitors the OSPFv3 packets.
<b>debug ipv6 ospf route</b>	Monitors the routing information about OSPFv3.

## 80.4 OSPFv3 Configuration Example

### 80.4.1 Example for OSPFv3 Route Learning Settings

OSPFv3 requires switching information among many internal routers, ABR and ASBR. In the minimum settings, the OSPFv3-based router works under the case that all its parameters take their default values and there is no authentication.

The following are three configuration examples:

The first example shows the commands for basic OSPFv3 settings.

The second example shows multiple OSPFv3 processes can be set on a router.

The third example shows how to use OSPFv3 to learn routes.

The fourth example shows how to set the OSPFv3 virtual link.

## Basic OSPFv3 Configuration Example

The following example shows a simple OSPFv3 settings. In this example, you have to activate process 90, connect Ethernet interface 0 to area 0.0.0.0, distribute RIPng to OSPFv3 and OSPFv3 to RIPng.

```
ipv6 unicast-routing
!
interface vlan 10
ipv6 address 2001::1/64
ipv6 enable
ipv6 rip aaa enable
ipv6 rip aaa split-horizon

ipv6 ospf 90 area 0
ipv6 ospf cost 1
!
router ospfv3 90
router-id 1.1.1.1
redistribute rip
!
router ripng aaa
redistribute ospf 90
```

## Configuring multiple OSPFv3 processes

The following example shows that two OSPFv3 processes are created.

```
ipv6 unicast-routing
!
!
interface vlan 10
  ipv6 address 2001::1/64
  ipv6 enable

  ipv6 ospf 109 area 0 instance 1
  ipv6 ospf 110 area 0 instance 2
!
!
interface vlan 11
  ip address 2002::1/64
  ipv6 enable

  ipv6 ospf 109 area 1 instance 1
  ipv6 ospf 110 area 1 instance 2
!
!
router ospfv3 109
  router-id 1.1.1.1
  redistribute static
!
router ospfv3 110
  router-id 2.2.2.2
!
```

Each interface can belong to many OSPFv3 processes, but if an interface belongs to multiple OSPFv3 processes each OSPFv3 process must correspond to different instances.

## Complicated configuration example

The following example shows how to configure multiple routers in a single OSPFv3 autonomous system. The following figure shows the network topology of the configuration example:

Configure the router according to the above-mentioned figure:

```
R1 :
interface vlan 0
  ipv6 enable

  ipv6 ospf 1 area 1
!
interface vlan 1
  ipv6 enable

  ipv6 ospf 1 area 0
!
ipv6 route 2001::/64 6::2
!
router ospfv3 1
  router-id 1.1.1.1
  redistribute static
!
```

```
R2 :
interface vlan 0
  ipv6 enable

  ipv6 ospf 1 area 1
!
!
router ospfv3 1
  router-id 2.2.2.2
!
```

Browsing the routing table of R2:

```
R2#show ipv6 route
O    6::/64[1]
     [110,20] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
O    2001::/64[1] (转发路由)
     [110,150] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
C    fe80::/10[1]
     is directly connected, L, Null0
C    fe80::/64[1]
     is directly connected, C, VLAN0
C    fe80::2e0:fff:fe26:a8/128[1]
     is directly connected, L, VLAN0
C    ff00::/8[1]
```

is directly connected, L,Null0

From the command sentences above, we can see that R2 has learned route forwarding.

Setting area 1 to be the stub area:

R1 :

```
interface vlan 0
  ipv6 enable

  ipv6 ospf 1 area 1
!
interface vlan 1
  ipv6 enable

  ipv6 ospf 1 area 0
!
ipv6 route 2001::/64 6::2
!
router ospfv3 1
  router-id 1.1.1.1
  area 1 stub
  redistribute static
!
```

R2 :

```
interface vlan 0
  ipv6 enable

  ipv6 ospf 1 area 1
!
!
router ospfv3 1
  router-id 2.2.2.2
  area 1 stub
!
```

Browsing the routing table of R2:

```
R2#show ipv6 route
O    ::/0[1]
      [110,11] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
O    6::/64[1]
      [110,20] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
C    fe80::/10[1]
      is directly connected, L,Null0
C    fe80::/64[1]
      is directly connected, C, VLAN0
C    fe80::2e0:fff:fe26:a8/128[1]
      is directly connected, L, VLAN0
C    ff00::/8[1]
      is directly connected, L,Null0
```

It can be judged that ABR in the stub area can generate a default route normally and notify other routers in this area without importing ASE LSA into the stub area.

## Configuring the virtual link

The following example shows how to configure a virtual link in a single autonomous OSPFv3 system. The following figure shows the network topology of the configuration example:

Configure the router according to the above-mentioned figure:

```
R1 :
interface vlan 0
  ipv6 address 101::1/64
  ipv6 enable

  ipv6 ospf 1 area 1
!
interface vlan 1
  ipv6 address 6::1/64
  ipv6 enable

  ipv6 ospf 1 area 0
!
ipv6 route 2001::/64 6::2
!
router ospfv3 1
  router-id 200.200.200.1
  area 1 virtual-link 200.200.200.2
  redistribute static
!
```

```
R2 :
interface vlan 0
  ipv6 address 101::2/64
  ipv6 enable

  ipv6 ospf 1 area 1
!
interface vlan 1
  ipv6 address 888::8/64
  ipv6 enable

  ipv6 ospf 1 area 2
!
!
router ospfv3 1
  router-id 200.200.200.2
  area 1 virtual-link 200.200.200.1
!
```

```
Browsing the state of the OSPFv3 neighbor:
R1#show ipv6 ospf neighbor
OSPFv3 Process (1)
```

Neighbor ID	Pri	State	Dead Time	Interface	Instance ID
200.200.200.2	1	Full/DR	00:00:35	VLAN0	0
200.200.200.2	1	Full/ -	00:00:36	VLINK1	0

R2#show ipv6 ospf neighbor

OSPFv3 Process (1)

OSPFv3 Process (1)

Neighbor ID	Pri	State	Dead Time	Interface	Instance ID
200.200.200.1	1	Full/Backup	00:00:36	VLAN0	0
200.200.200.1	1	Full/ -	00:00:37	VLINK1	0

Browsing the information in the routing table:

R1#show ipv6 route

```

C    6::/64[1]
     is directly connected, C,VLAN1
C    6::1/128[1]
     is directly connected, L, VLAN1
C    101::/64[2]
     is directly connected, C, VLAN0
C    101::1/128[2]
     is directly connected, L, VLAN0
O    101::2/128[2]
     [110,10] via fe80:4::2e0:fff:fe26:a8(on VLAN0)
O    888::/64[2]
     [110,20] via fe80:4::2e0:fff:fe26:a8(on VLAN0)
S    2001::/64[1]
     [1,0] via 6::2(on VLAN1)
C    fe80::/10[2]
     is directly connected, L,Null0
C    fe80::/64[2]
     is directly connected, C, VLAN0
C    fe80::2e0:fff:fe26:2d98/128[2]
     is directly connected, L, VLAN0
C    fe80::/64[1]
     is directly connected, C, VLAN1
C    fe80::2e0:fff:fe26:2d99/128[1]
     is directly connected, L, VLAN1
C    ff00::/8[2]
     is directly connected, L,Null0

```

R2#show ipv6 route

```

O    6::/64[1]
     [110,20] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
C    101::/64[1]
     is directly connected, C, VLAN0
O    101::1/128[1]
     [110,10] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
C    101::2/128[1]
     is directly connected, L, VLAN0
C    888::/64[1]
     is directly connected, C, VLAN1
C    888::8/128[1]
     is directly connected, L, VLAN1
O    2001::/64[1]
     [110,150] via fe80:4::2e0:fff:fe26:2d98(on VLAN0)
C    fe80::/10[1]
     is directly connected, L,Null0
C    fe80::/64[1]
     is directly connected, C, VLAN0

```

C fe80::2e0:fff:fe26:a8/128[1]  
is directly connected, L, VLAN0  
C fe80::/64[1]  
is directly connected, C, VLAN1  
C fe80::2e0:fff:fe26:a9/128[1]  
is directly connected, L, VLAN1  
C ff00::/8[1]  
is directly connected, L, Null0

# Chapter 81 Overview

## 81.1 Stipulation

### 81.1.1 Format Stipulation in the Command Line

Syntax	Meaning
<b>Bold</b>	Stands for the keyword in the command line, which stays unchanged and must be entered without any modification. It is presented as a bold in the command line.
<i>{italic}</i>	Stands for the parameter in the command line, which must be replaced by the actual value. It must be presented by the italic in the brace.
< <i>italic</i> >	Stands for the parameter in the command line, which must be replaced by the actual value. It must be presented by the italic in the point bracket.
[ ]	Stands for the optional parameter, which is in the square bracket.
{ x   y   ... }	Means that you can choose one option from two or more options.
[ x   y   ... ]	Means that you can choose one option or none from two or more options.
{ x   y   ... } *	Means that you has to choose at least one option from two or more options, or even choose all options.
[ x   y   ... ] *	Means that you can choose multiple options or none from two or more options.
&<1-n>	Means that the parameter before the "&" symbol can be entered 1~n times.
#	Means that the line starting with the "#" symbol is an explanation line.

# Chapter 82 NTP Configuration

## 82.1 Overview

Network Time Protocol (NTP) is a type of computer time synchronization protocol which can be used for time synchronization between distributed time servers and clients. It has highly accurate time correction function and can prevent malicious protocol attacks through encrypted authentication. Clients and servers communicate through the User Datagram Protocol (UDP), and the port number is 123.

## 82.2 NTP Configuration

### 82.2.1 Configuring the Equipment As an NTP Server

Configuration mode: Global

Command	Purpose
<b>ntp master primary</b>	In the event that the equipment does not have an upper-level NTP server, configure the equipment as the original NTP server (stratum = 1).
<b>ntp master secondary</b>	In the event that the equipment has an upper-level NTP server, configure the equipment as the secondary NTP server.  (In other words, the equipment cannot provide time synchronization service for NTP clients unless the "ntp server" command is configured and time synchronization is achieved in designated servers.)

### 82.2.2 Configuring NTP Authentication Function

Configuration mode: Global

Command	Purpose
<b>ntp authentication enable</b>	Enable the authentication function (disabled by default).
<b>ntp authentication key</b> <i>keyid md5 password</i>	Configure NTP md5 authentication keyid and corresponding keys.
<b>ntp authentication trusted-key</b> <i>keyid</i>	Configure the keyid corresponding key as the trusted key.

### 82.2.3 Configuring NTP Association

Configuration mode: Global

Command	Purpose
<b>ntp server</b> <i>ip-address [version number   key keyed   vrf vrf-name]*</i>	Configure the IP address of NTP server; the version number, key number, and vrf instance

	can be designated.
<b>ntp peer</b> <i>ip-address</i> [ <b>version</b> <i>number</i>   <b>key</b> <i>keyid</i>   <b>vrf</b> <i>vrf-name</i> ]*	Configure the IP address of equipment NTP peer; the version number, key number, and vrf instance can be designated.

**Usage Guidelines:**

1. Equipment can provide time services for NTP clients provided that the equipment has achieved time synchronization; otherwise the client device that employs the equipment as its server cannot achieve time synchronization.
2. To conduct NTP authentication, both parties must open the NTP authentication function simultaneously, configure the same keyid and key, and designate the keyid as trusted; otherwise time synchronization would fail.

# Chapter 83 IPv6 ACL Configuration

## 83.1 IPv6 ACL Configuration

### 83.1.1 Filtering IPv6 Packets

Filtering IPv6 packets helps the control packet run in the network. Such control can limit network transmission and network running by a certain user or device. For enabling or disabling packets from the cross designated port, we provide with ACL. You can use IPv6 ACL as follows:

- (12) Limit of packet transmission on the port
- (13) Limit of virtual terminal line access
- (14) Limit of the route update

This chapter summarizes how to set up IPv6 ACL and how to apply them.

IPv6 ACL is a well-organized set which applies enable/disable of IPv6 address. ROS of the switch will test addresses in ACL accordingly. The first match determines whether the software accept or refuse the address. Because after the first match, the software will stop the match rule, the sequence of the condition is important. If there is no rule to match, the address will be refused.

Steps for using ACL:

- Set up ACL by designating ACL name and ACL conditions.
- Apply ACL to the port.

### 83.1.2 Setting up IPv6 ACL

Use a character string to set up IPv6 ACL.

**Note:**

The standard ACL and the expanded ACL cannot be the same.

In order to set up IPv6 ACL, run the following command in the global configuration mode.

Command	Purpose
<b>IPv6 access-list name</b>	Use the name to define an IPv6 ACL.
<b>{deny   permit} protocol {source-ipv6-prefix/prefix-length   any   host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length   any   host destination-ipv6-address} [dscp value] [flow-label value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]</b>	In the configuration mode of IPv6 ACL, designate one or multiple enable/disable conditions. This determines whether to pass the packet or not. (dscp is used for matching IPv6 grouping header Traffic Class domain, flow-label is used for matching Flow Label tag domain of IPv6 grouping header, fragments is used for matching fragment grouping when the grouping expansion header includes none-0 offset; log means whether to record log, routing is used for the source grouping of the route expansion header of IPv6 grouping header, time-range is used for limit the time range of ACL.)
<b>Exit</b>	Exit from the configuration mode of ACL.

After setting up ACL, any additional parts will be affiliated to the end of the ACL if no sequence is added to the

rule deny or permit. In other words, add [sequence value] in the front or back of the rule deny/permit, you can add ACL commands in any position of the designated ACL.

Likewise, you can use “no permit” and “no deny” to delete an item in ACL or “no sequence” to delete the rule in a certain position directly.

**Note:**

When setting up ACL, please remember the end sentence of ACL by default covers the sentence of **deny ipv6 any any**.

The ACL must be applied to the line or port after being set up. Refer to the description of “Apply the ACL to the port”.

### 83.1.3 Applying ACL to the Ports

ACL can be applied to one or multiple ports or the ingress.

Run this command in the configuration mode.

Command	Purpose
IPv6 access-group <i>name</i>	Apply ACL to the port.

For the standard ingress ACL, check the source address of the packet after receiving it. For the expanded ACL, the routing switch also checks the objective address. If the ACL enables the address, the software continues to handle the packet. If ACL does not allow the address, the software will drop the packet and returns one ICMP host unreachable packets.

If there is no designated ACL, all packets will be allowed to pass.

### 83.1.4 Examples of IPv6 ACL

In the following example, please first enable to connect with the individual destination host of the host A:B:C:D::E and disable the new TCP to connect with SMTP port whose host IPv6 source prefix 255:255:255::/48. The next rule sequence of the final ACL comes before the former rule.

```
Switch_config#ipv6 access-list xxcom
Switch_config_ipv6acl#permit any host A:B:C:D::E sequence 20
Switch_config_ipv6acl#deny tcp any 255:255:255::/48 eq 25 sequence 10
Switch_config_ipv6acl#ex
Switch_config#show ipv6 access-lists xxcom
ipv6 access-list xxcom
  deny tcp any 255:255:255::/48 eq smtp sequence 10
  permit ipv6 any host A:B:C:D::E sequence 20
```

# Chapter 84 Configuring Time Range

## 84.1 Time Range Introduction

### 84.1.1 Overview

Time Range is a time module controlling the effective time and the failure time of a function (For instance, expansion IP access control list).

Time Range can play its role only when cooperating with other modules which support the Time Range function.

Time Range is consisted of separate time ranges. These time ranges have two kinds: one is absolute and the other is periodic. Of these, periodic is classified into two kinds further: isolate and from-to.

The whole system has many Time Ranges. Each Time Range is differentiated according to their names(case sensitive). Each Time Range has at most only one absolute time range but many periodic time ranges.

### 84.1.2 Absolute Time Range

Absolute Time Range is a time range starting and ending with concrete date and time (The Absolute Time Range without concrete starting date and time is taken as the current time; the absolute time range without concrete ending time is taken as effective forever.). For example, 08:08 8 8 2008 - 10:10 10 10 2010 is an absolute time range.

### 84.1.3 Periodic Time Range

Periodic Time Range is a back-and-forth time range. It has no concrete starting time and ending time, but it has concrete starting week and moment and ending date and moment. For example, a periodic time range starts from 20:00~21:00 on every Tuesday, Thursday and Sunday; or starts from 09:00 on every Tuesday to 18:00 on every Thursday. More examples such as 09:00~10:00 in every weekend; 23:00~07:00 everyday; and 09:00~18:00 on weekdays.

### 84.1.4 Isolating Time Range

Isolate Time Range is one type of Periodic Time Range. It is periodical. And its starting time and ending time will not span 24 hours. For example, 19:00~19:30 on every Monday is an isolate time range; 20:00~21:00 on every Tuesday, Thursday and Sunday is an isolate time range; but time from 09:00 on Tuesday to 18:00 on every Thursday is not an isolate time range, but "from-to time range" described below.

### 84.1.5 From-to Time Range

From-to Time Range is also a type of Periodic Time Range. It is periodical. Moreover, its starting time and ending time must span at least 24 hours. For example, time from 09:00 on Tuesday to 18:00 on every Thursday

is a from-to time range.

## 84.1.6 Activating Time Range

A Time Range can have the absolute time range and periodic time range simultaneously. The state of Time Range can be divided into 4 situations according to whether the absolute time range/periodic time range is configured.

### Situation 1

If a Time Range neither configure absolute time range nor periodic time range, it is called EMPTY. The Time Range does not exist activating time range.

### Situation 2

If a Time Range doesn't have the absolute time but has periodic time range, the activating time range of the Time Range is the total time ranges of the periodic time range.

### Situation 3

If a Time Range doesn't have the periodic time but has absolute time range, the activating time range of the Time Range is the total time ranges of the absolute time range.

### Situation 4

If a Time Range neither have the periodic time nor the absolute time range, the activating time range of the Time Range is set intersection of the set union of the absolute time range and all periodic time range.

The complementary set of the activating time range of a Time Range is considered as non-activating time range.

If the system time is in an activating time range of a Time Range, the Time Range is active; if a Time Range has the activating time range but the system time does not in the activating range, the time range is inactive; if a Time Range does not have the activating time range, the Time Range is empty.

When a Time Range changes among inactive, active and empty, the Time Range is changed. Otherwise, the Time Range is unchanged.

## 84.2 Time Range Configuration Task List

- Adding/ing Time Range
- Adding/Deleting Absolute Time Range
- Adding/ing Periodic Time Range
- Applying Time Range
- Monitoring the configuration and state of Time Range

## 84.3 Time Range Configuration Task

### 84.3.1 Adding/Deleting Time Range

The whole system has many Time Ranges. Each Time Range is differentiated according to their names (case sensitive).

Run the following commands to configure Time Range:

Command	Purpose
<b>time-range</b> <i>name</i>	Add a Time Range named <i>name</i> and enter the configuration mode of Time Range
<b>exit</b>	Exit the configuration mode of Time Range
<b>no time-range</b> <i>name</i>	Delete Time Range named <i>name</i>

Note:

1. If the system has Time Range named *name*, *run command* `time-range name` to enter the **TimeRange configuration mode**, but not create the new TimeRange.

### 84.3.2 Adding/Deleting Absolute Time Range

Each TimeRange has only at most only one absolute time range. Absolute Time Range can have the starting time and the ending time simultaneously or it has the ending time but not the starting time, or it has the starting time but not the ending time. When the absolute time has no starting time, the current time is the starting time; when the absolute time has no ending time, the absolute time is effective forever.

To configure the absolute time range, run the following command:

Command	Purpose
<b>absolute</b> { <b>start</b> <i>hour:minute day month year end hour:minute</i> <i>day month year</i>   <b>start</b> <i>hour:minute day month year</i>   <b>end</b> <i>hour:minute day month year</i> }	Adds an absolute time range
<b>no absolute</b>	Deletes the absolute time range

Note:

1. If a Time Range has the absolute time range, the absolute command modifies the absolute time range.

### 84.3.3 Adding/Deleting Periodic Time Range

A Time Range can has many periodic time ranges. Each periodic time range is not all the same, but the time range can overlap.

To configure the periodic time, run the following command:

Command	Purpose
<b>periodic</b> { <b>daily</b> <i>hour:minute to hour:minute</i>   <b>weekdays</b> <i>hour:minute to hour:minute</i>	Adds a periodic time range

weekend <i>hour:minute to hour:minute</i>   {Friday   Monday   Saturday   Sunday   Thursday  Tuesday Wednesday} <i>hour:minute to hour:minute</i>   {Friday   Monday   Saturday   Sunday   Thursday   Tuesday   Wednesday} <i>hour:minute to {Friday   Monday   Saturday    Sunday   Thursday   Tuesday   Wednesday} hour:minute }</i>	
no periodic [ daily <i>hour:minute to hour:minute</i>   weekdays <i>hour:minute to hour:minute</i>   weekend <i>hour:minute to hour:minute</i>   {Friday   Monday   Saturday   Sunday   Thursday  Tuesday Wednesday} <i>hour:minute to hour:minute</i>   {Friday   Monday   Saturday   Sunday   Thursday   Tuesday   Wednesday} <i>hour:minute to {Friday   Monday   Saturday    Sunday   Thursday   Tuesday   Wednesday} hour:minute ]</i>	Deletes a periodic time range

### 84.3.4 Applying Time Range

A created Time Range can be applied to one or more function modules. At present the Time Range can only be applied to IP ACL function module.

In order to apply Time Range to IP ACL, you must enter the name of Time Range to the end of the sub-command of time-range.

**Note:**

1. Time Range can only be applied to extensible ACL, but not to the standard ACL.

### 84.3.5 Monitoring the configuration and state of Time Range

To monitor Time Range Configuration, run the following command:

Command	Purpose
<b>show time-range</b>	Shows the configuration of all Time Range in the system
<b>show time-range name</b>	Shows the configuration of Time Range named name.

**Attach: The result analysis of the command**

Take the result of the typical configuration as an example:

Switch_config#show time-range  Now: Date: 2016.3.4      Time: 13:16      Day: Tuesday  time-range entry: x (inactive) absolute start 12:00 1 January 2008 end 13:00 2 January 2016
---

```

periodic weekdays 09:00 to 18:00
time-range entry: y (empty)
time-range entry: z (active)
  periodic daily 12:00 to 13:00
  periodic Monday Thursday Friday 08:00 to 09:00
  periodic Saturday 15:00 to Sunday 20:00
  periodic daily 9:00 AM to 6:00 PM
Switch_config#

```

In the first line shows “Now: Date: 2016.3.4 Time: 13:16 Day: Tuesday”, which means the date is 4th March, 2016; the time is 13:16; the day is Tuesday.

Subsequently the screen shows the configuration and status of Time Ranges which named x, y and z respectively. Time Range x has two items: absolute time and period, and it is in the inactive state; Time Range y has no item and it is in the empty state; Time Range z has 4 periods and it is in active state.

## 84.4 Configuration Example

The following example shows how to apply a Time Range named sample to a rule of extensible IP ACL ex.

```

Switch_config# time-range sample
Switch_config_tr# periodic monday 12:00 to 13:00
Switch_config_tr# exit
Switch_config# ip access-list extended ex
Switch_config_ext#
Switch_config_ext# permit ip 192.168.213.180 255.255.255.255 any time-range sample
Switch_config_extl# exit

```
