If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

CE Mark Warning

This equipment is compliant with Class A of CISPR 32. In a residential environment this equipment may cause radio interference.

Energy Saving Note of the Device

This power required device does not support Standby mode operation. For energy saving, please remove the power cable to disconnect the device from the power circuit. In view of saving the energy and reducing the unnecessary power consumption, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

Revision

PLANET XGS-6320 Series User's Manual

Models: XGS-6320-8X8TR, XGS-6320-12X4TR

Revision: 1.0 (Feb, 2023)

Part No: EM-XGS-6320 Series_v1.0

TABLE OF CONTENTS

1. INTRODUCTION.....	13
1.1 Packet Contents	13
1.2 Product Description	13
1.3 Product Features	17
1.4 Product Specifications	20
2. INSTALLATION	25
2.1 Hardware Description	25
2.1.1 Switch Front Panel	25
2.1.2 LED Indications	26
2.1.3 Switch Rear Panel.....	28
2.2 Installing the Switch.....	28
2.2.1 Desktop Installation	29
2.2.2 Rack Mounting.....	30
2.2.3 Installing the SFP/SFP+ Transceiver	31
3. SWITCH MANAGEMENT	35
3.1 Requirements	35
3.2 Management Access Overview.....	36
3.3 Administration Console.....	37
3.4 Web Management.....	38
3.5 SNMP-based Network Management	39
3.6 PLANET Smart Discovery Utility	39
4. WEB CONFIGURATION	41
4.1 Main Web Page	43
4.2 System.....	45
4.2.1 Management.....	46
4.2.1.1 System Information.....	46
4.2.1.2 IP Configuration.....	47
4.2.1.3 IP Status.....	49

4.2.1.4 ARP	50
4.2.1.5 Users Configuration	51
4.2.1.6 Privilege Levels	53
4.2.1.7 NTP Configuration	55
4.2.1.8 Time Configuration	56
4.2.1.9 UPnP	58
4.2.1.10 CPU Load	60
4.2.1.11 System Log	61
4.2.1.12 Detailed Log	62
4.2.1.13 Remote Syslog	63
4.2.1.14 SMTP Configuration	64
4.2.2 SNMP	65
4.2.2.1 SNMP Overview	65
4.2.2.2 System Configuration	66
4.2.2.3 System Information	67
4.2.2.4 SNMP Trap Configuration	68
4.2.2.5 Source	70
4.2.2.6 SNMPv3 Communities	72
4.2.2.7 SNMPv3 Users	73

A.1 Switch's Data RJ45 Pin Assignments - 1000Mbps, 1000BASE-T	442
A.2 10/100Mbps, 10/100BASE-TX	442
APPENDIX B : GLOSSARY	444

1. INTRODUCTION

1.1 Packet Contents

Open the box of the Managed Switch and carefully unpack it. The box should contain the following items:

- ◆ **The Managed Switch**
- ◆ **Quick Installation Guide Sheet**
- ◆ **RJ45 to RS232 Cable**
- ◆ **Two Rack-mounting Brackets with Attachment Screws**
- ◆ **Power Cord**
- ◆ **SFP Dust-proof Caps**

Model Name	SFP Dust-proof Caps
XGS-6320-8X8TR	8
XGS-6320-12X4TR	12

If any of these are missing or damaged, please contact your dealer immediately; if possible, retain the carton including the original packing material, and use them again to repack the product in case there is a need to return it to us for repair.

1.2 Product Description

Perfect Managed All-port 10Gbps Switch with L3/L2 Switching and Security

PLANET XGS-6320 series is a **fully-managed all-port 10Gbps Ethernet switch** designed for the demand of high-bandwidth required network equipment, such as Wi-Fi 6/6E wireless AP, NAS, workstation and those with 10Gbps fiber or copper interfaces. It features **multiple 10GBASE-T copper** ports and **10GBASE-X SFP+ fiber** ports that are flexibly designed to extend the connection distance.

Models	10GBASE-X SFP+ Port	10GBASE-T RJ45 Port	Power Input - AC	Power Input -DC
XGS-6320-8X8TR	8	8	100-240V AC	36-60V DC
XGS-6320-12X4TR	12	4		

With such a favorable data link capability, hardware-based Layer 3 routing performance, Layer 2 and Layer 4 switching engine and user-friendly yet advanced IPv6/IPv4 management interfaces, it helps to accelerate the deployment of the next-generation high-bandwidth required network for Metro, smart cities and enterprises.

10GBASE-T and 10GBASE-X SFP Dual Media Interfaces for Diversified Bandwidth Applications

PLANET XGS-6320 series has the capability to reach a high speed of 10Gbps over copper or fiber-optic cabling which helps to accelerate the performance of large data transmission. The built-in 10GBASE-T copper interfaces support 5-speed (10G/5G/2.5G/1G/100) auto-negotiation, and 10Gbps data transmission with the existing Cat6A/Cat7 UTP cabling, meaning the speed can be increased without costs. It can definitely give you the speed you demand and its Plug and Play makes installation easy.

The fiber-optic 10GBASE-X SFP+ interfaces support 4 speeds, 10GBASE-SR/LR, 2500BASE-X, 1000BASE-SX/LX and 100BASE-FX, meaning the administrator now can flexibly choose the suitable SFP/SFP+ transceiver according to the transmission distance or the transmission speed required to extend the network efficiently.

Redundant Ring, Fast Recovery for Critical Network Applications

The XGS-6320 series supports redundant ring technology and features strong, rapid self-recovery capability to prevent interruptions and external intrusions. It incorporates advanced ITU-T **G.8032 ERPS (Ethernet Ring Protection Switching)** technology and Spanning Tree Protocol (802.1w RSTP) into customer's network to enhance system reliability and uptime in harsh environments. In a certain simple Ring network, the recovery time could be **less than 10ms** to quickly bring the network back to normal operation.

Cybersecurity Network Solution to Minimize Security Risks

The cybersecurity feature included to protect the switch management in a mission-critical network virtually needs no effort and cost to install. Both SSHv2 and TLSv1.2 protocols are utilized to provide strong protection against advanced threats. The network administrator can now construct highly-secure corporate networks with considerably less time and effort than before.

AC and DC Redundant Power to Ensure Continuous Operation

The XGS-6320 series is equipped with one 100~240V AC power supply unit and one additional 36-60V DC power supply unit for redundant power supply. A redundant power system is also provided to enhance the reliability with either AC or DC power supply unit. The redundant power system is specifically designed to handle the demands of high-tech facilities requiring the highest power integrity.

Solution for IPv6 Networking

With the support for IPv6/IPv4 protocol, and easy and user-friendly management interfaces, the XGS-6320 series is the best choice for IP surveillance, VoIP and wireless service providers to connect with the IPv6 network. It also helps SMBs to step in the IPv6 era with the lowest investment and without having to replace the network facilities even though ISPs establish the IPv6 edge network.

Layer 3 Routing Support

The XGS-6320 series enables the administrator to conveniently boost network efficiency by configuring Layer 3 IPv4/IPv6 VLAN static routing manually, the RIP (Routing Information Protocol) or **OSPF** (Open Shortest Path First) settings automatically.

The RIP can employ the hop count as a routing metric and prevent routing loops by implementing a limit on the number of hops allowed in a path from the source to a destination.

The OSPF is an interior dynamic routing protocol for autonomous system based on link state. The protocol creates a database for link state by exchanging link states among Layer3 switches, and then uses the Shortest Path First algorithm to generate a route table based on that database.

Robust Layer 2 Features

The XGS-6320 series can be programmed for advanced switch management function, such as dynamic port link aggregation, **Q-in-Q VLAN**, **Multiple Spanning Tree Protocol (MSTP)**, Layer2/4 QoS, bandwidth control and **IGMP/MLD snooping**. It allows the operation of a high-speed trunk combining multiple ports. Supporting 8 trunk groups, it enables a maximum of up to 16 ports per trunk and supports connection fail-over as well.

Powerful Network Security

The XGS-6320 series offers comprehensive **Layer2 to Layer4 access control list (ACL)** for enforcing security to the edge. It can be used to restrict network access by denying packets based on source and destination IP address, TCP/UDP port number or defined typical network applications. Its protection mechanism also comprises **802.1x Port-based** and **MAC-based** user and device authentication. With the **private VLAN** function, communication between edge ports can be prevented to ensure user privacy.

Advanced IP Network Protection

The XGS-6320 series also provides **DHCP Snooping**, **IP Source Guard** and **Dynamic ARP Inspection** functions to prevent IP snooping from attack and discard ARP packets with invalid MAC address. The network administrator can now build highly-secure corporate networks with considerably less time and effort than before.

Efficient Management

For efficient management, the XGS-6320 series is equipped with console, Web and SNMP management interfaces.

- With the built-in **Web-based** management interface, it offers an easy-to-use, platform-independent management and configuration facility.
- For **text-based** management, it can be accessed via Telnet and the console port.
- For standard-based monitor and management software, it offers SNMPv3 connection which encrypts the packet content at each session for secure remote management.

Remotely Managed Solution

PLANET's **Universal Network Management System (UNI-NMS)** and CloudViewer App support IT staff to remotely manage all network devices and monitor the PDs' operational statuses. Thus, they're designed for both the enterprises and industries where deployments of PDs can be as remote as possible, without having to go to the actual location once a bug or faulty condition is found. With the UNI-NMS or CloudViewer App, all kinds of businesses can now be speedily and efficiently managed from one platform.

Intelligent SFP Diagnosis Mechanism

The XGS-6320 series supports **SFP-DDM (Digital Diagnostic Monitor)** function that greatly helps network administrator to easily monitor real-time parameters of the SFP and SFP+ transceivers, such as optical output power, optical input power, temperature, laser bias current, and transceiver supply voltage.

SMTP/SNMP Trap Event Alert

Though most NVR or camera management software offers SMTP email alert function, the XGS-6320 series further provides event alert function to help to diagnose the abnormal device owing to whether or not there is a break of the network connection.

1.3 Product Features

➤ **Physical Port**

■ **XGS-6320-8X8TR**

- Eight 10GBASE-X SFP+ ports, backward compatible with 100BASE-FX, 1000BASE-X and 2500BASE-X SFP transceivers
- Eight 10GBASE-T RJ45 ports, backward compatible with 100/1G/2.5G/5GBASE-T auto-negotiation

■ **XGS-6320-12X4TR**

- Twelve 10GBASE-X SFP+ ports, backward compatible with 100BASE-FX, 1000BASE-X and 2500BASE-X SFP transceivers
- Eight 10GBASE-T RJ45 ports, backward compatible with 100/1G/2.5G/5GBASE-T auto-negotiation
- RJ45 type RS232 console interface for switch basic management

➤ **Redundant Power System**

- Redundant 100~240V AC and 36-60V DC dual power
- Active-active redundant power failure protection
- Backup of catastrophic power failure on one supply
- Fault tolerance and resilience

➤ **Layer 3 IP Routing Features**

- IPv4 dynamic routing protocol supports RIPv2 and OSPFv2 and IPv6 OSPFv3
- IPv6 dynamic routing protocol supports OSPFv3
- IPv4/IPv6 hardware static routing
- Routing interface provides per VLAN routing mode

➤ **Layer 2 Features**

- Storm Control support
 - Broadcast/Multicast/Unknown unicast
- Supports VLAN
 - IEEE 802.1Q tagged VLAN
 - Supports provider bridging (VLAN Q-in-Q, IEEE 802.1ad)
 - Private VLAN Edge (PVE)
 - Protocol-based VLAN
 - MAC-based VLAN
 - Voice VLAN
 - GVRP (GARP VLAN Registration Protocol)
- Supports Spanning Tree Protocol
 - IEEE 802.1D Spanning Tree Protocol
 - IEEE 802.1w Rapid Spanning Tree Protocol
 - IEEE 802.1s Multiple Spanning Tree Protocol, spanning tree by VLAN
 - BPDU Guard
- Supports Link Aggregation
 - 802.3ad Link Aggregation Control Protocol(LACP)
 - Cisco ether-channel (static trunk)
 - Maximum 8 trunk groups, up to 16 ports per trunk group

- Provides port mirror (many-to-1)
- Port mirroring to monitor the incoming or outgoing traffic on a particular port
- Loop protection to avoid broadcast loops
- Link Layer Discovery Protocol (LLDP)
- Compatible with Cisco uni-directional link detection(UDLD) that monitors a link between two switches and blocks the ports on both ends of the link if the link fails at any point between the two devices
- Supports G.8032 ERPS (Ethernet Ring Protection Switching)

➤ **Quality of Service**

- Ingress Shaper and Egress Rate Limit per port bandwidth control
- 8 priority queues on all switch ports
- Traffic classification
 - IEEE 802.1p CoS
 - TOS/DSCP/IP Precedence of IPv4/IPv6 packets
 - IP TCP/UDP port number
 - Typical network application
- Strict priority and Weighted Round Robin (WRR) CoS policies
- Supports QoS and In/Out bandwidth control on each port
- Traffic-policing on the switch port
- DSCP remarking

➤ **Multicast**

- Supports IPv4 IGMP Snooping v1, v2 and v3
- Supports IPv6 MLD Snooping v1 and v2
- Querier mode support
- IPv4 IGMP Snooping port filtering
- IPv6 MLD Snooping port filtering
- Multicast VLAN Registration (MVR) support

➤ **Security**

- Authentication
 - IEEE 802.1x Port-based/MAC-based network access authentication
 - Built-in RADIUS client to co-operate with the RADIUS servers
 - TACACS+ login users access authentication
 - RADIUS/TACACS+ users access authentication
 - Guest VLAN assigns clients to a restricted VLAN with limited services
- Access Control List
 - IP-based Access Control List (ACL)
 - MAC-based Access Control List
- Source MAC/IP address binding
- **DHCP Snooping** to filter un-trusted DHCP messages
- **Dynamic ARP Inspection** discards ARP packets with invalid MAC address to IP address binding
- **IP Source Guard** prevents IP spoofing attacks
- IP address access management to prevent unauthorized intruder

➤ **Management**

- IPv4 and IPv6 dual stack management
- Switch Management Interfaces
 - Web switch management
 - Console and Telnet Command Line Interface
 - SNMP v1 and v2c switch management
 - SSHv2, TLSv1.2 and SNMPv3 secure access
- SNMP Management
 - Four RMON groups (history, statistics, alarms and events)
 - SNMP trap for interface Linkup and Linkdown notification
- IPv6 IP Address/NTP/DNS management
- Built-in Trivial File Transfer Protocol (TFTP) client
- BOOTP and DHCP for IP address assignment
- System Maintenance
 - Firmware upload/download via HTTP/TFTP
 - Reset button for system reboot or reset to factory default
 - Dual Images
- DHCP Functions:
 - DHCP Relay
 - DHCP Option82
 - DHCP Server
- User Privilege levels control
- NTP (Network Time Protocol)
- Network Diagnostic
 - ICMPv6/ICMPv4 Remote Ping
 - SFP-DDM (Digital Diagnostic Monitor)
- SMTP, Syslog and SNMP trap remote alarm
- System Log
- PLANET Smart Discovery Utility for deployment management
- PLANET UNI-NMS (Universal Network Management) and CloudViewer app for deployment management

1.4 Product Specifications

Product	XGS-6320-8T8XR	XGS-6320-12X4TR
Hardware Specifications		
Copper Ports	8 10GBASE-T RJ45 auto negotiation ports (Ports 9 to 16) Supports 10G/5G/2.5G/1G/100Mbps data rate	4 10GBASE-T RJ45 auto negotiation ports (Ports 13 to 16) Supports 10G/5G/2.5G/1G/100Mbps data rate
SFP+ Slots	8 10GBASE-SR/LR SFP+ ports (Ports 1 to 8) Backward compatible with 100BASE-FX, 1000BASE-SX/LX/BX and 2500BASE-X SFP transceivers	12 10GBASE-SR/LR SFP+ ports (Ports 1 to 12) Backward compatible with 100BASE-FX, 1000BASE-SX/LX/BX and 2500BASE-X SFP transceivers
Console	1 x RJ45-to-DB9, RS232 serial port (115200, 8, N, 1)	
Reset Button	< 5 sec: System reboot > 5 sec: Factory default	
RAM	2048Mbytes	
Flash Memory	128Mbytes	
Dimensions (W x D x H)	440 x 200 x 44.5mm, 1U height	
Weight	2,870g	2,832g
Power Requirements - AC	100~240V AC, 50/60Hz, 2.1A max.	
Power Requirement - DC	DC 36-60V, 2A	
Power Consumption	AC Input: System On: 22W Full loading: 44W DC Input: System on: 25W Full loading: 45W	AC Input: System On: 22W Full loading: 40W DC Input: System on: 25W Full loading: 40W
ESD Protection	6KV DC	
Surge Protection	4KV DC	
Fan	2 smart fans - Low Speed: Controller temperature < 70 degrees C - High Speed: Controller temperature > 75 degrees C	
LED	System: AC (Green), DC (Green), Ring (Green), Ring Owner (Green) Per 10GBASE-T RJ45 port: 100/1G/ LNK/ACT (Green) 10G LNK/ACT (Amber) 2.5G/5G LNK/ACT (Green and Amber) Per 10GBASE-X SFP+ port: 100/1G/ LNK/ACT (Green) 10G LNK/ACT (Amber) 2.5G LNK/ACT (Green and Amber)	
Switching Specifications		

Switch Architecture	Store-and-Forward
Switch Fabric	320Gbps/non-blocking
Throughput	238.1Mpps@ 64Bytes packet
Address Table	32K entries, automatic source address learning and aging
Shared Data Buffer	32Mbits
Flow Control	IEEE 802.3x pause frame for full duplex Back pressure for half duplex
Jumbo Frame	10240bytes
Layer 3 Functions	
IP Interfaces	Max. 128 VLAN interfaces
Routing Table	Max. 512 static route entries Max. 3072 routing table entries
Routing Protocols	IPv4 RIPv2 IPv4 OSPFv2 IPv6 OSPFv3 IPv4 hardware static routing IPv6 hardware static routing
Layer 2 Functions	
Port Configuration	Port disable/enable Flow Control disable/enable
Port Status	Display each port's speed duplex mode, link status, flow control status, auto negotiation status, trunk status
Port Mirroring	TX/RX/Both Many-to-1 monitor Supports up to 5 sessions
VLAN	IEEE 802.1Q tag-based VLAN, IEEE 802.1ad Q-in-Q tunneling Private VLAN Edge (PVE), up to 9 VLAN groups MAC-based VLAN Protocol-based VLAN Voice VLAN - supports 1 Voice VLAN groups MVR (Multicast VLAN Registration) GVRP Up to 4K VLAN groups, out of 4094 VLAN IDs
Spanning Tree Protocol	IEEE 802.1D Spanning Tree Protocol (STP) IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) Supports 7 MSTP instances BPDU Guard, BPDU filtering and BPDU transparent Root Guard
Link Aggregation	IEEE 802.3ad LACP (static trunk) Supports 8 trunk groups with 16 ports per trunk
IGMP Snooping	IPv4 IGMP (v1/v2/v3) snooping IPv4 IGMP querier mode support Supports 255 IGMP groups

MLD Snooping	IPv6 MLD (v1/v2) snooping, IPv6 MLD querier mode support Supports 255 MLD groups
Bandwidth Control	Per port bandwidth control Ingress: 10Kbps~13128Mbps Egress: 10Kbps~13128Mbps
Ring	Supports ERPS, and complies with ITU-T G.8032 Recovery time < 10ms @ 3 nodes Recovery time <50ms @ 16 nodes Supports Major ring and sub-ring
QoS	Traffic classification based, strict priority and WRR 8-level priority for switching - Port number - 802.1p priority - 802.1Q VLAN tag - DSCP/TOS field in IP packet
Security Functions	
Access Control List	IP-based ACL/MAC-based ACL ACL based on: - MAC Address - IP Address - Ethertype - Protocol Type - VLAN ID - DSCP - 802.1p Priority Up to 512 entries
Security	Port security IP source guard, up to 512 entries Dynamic ARP inspection, up to 1K entries Command line authority control based on user level Static MAC address, up to 64 entries
AAA	RADIUS client TACACS+ client
Network Access Control	IEEE 802.1x port-based network access control MAC-based authentication Local/RADIUS authentication Supports 5 RADIUS authentications servers Supports 5 TACACS+ authentications servers
Authorization User Levels	15
Management Functions	
Basic Management Interfaces	Console;Telnet; Web browser; SNMP v1, v2c
Secure Management Interfaces	SSHv2, TLSv1.2, SNMPv3 Supports 4 Telnet/SSHv2 sessions
Number of Logged in users	20

2. INSTALLATION

This section describes the hardware features and installation of the Managed Switch on the desktop or rack mount. For easier management and control of the Managed Switch, familiarize yourself with its display indicators, and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the Managed Switch, please read this chapter completely.

2.1 Hardware Description

2.1.1 Switch Front Panel

The front panel provides a simple interface monitoring the Managed Switch. [Figures 2-1-1 and 2-1-2](#) show the front panels of the Managed Switches.

XGS-6320-8X8TR Front Panel

Figure 2-1-1: Front Panel of XGS-6320-8X8TR

XGS-6320-12X4TR Front Panel

Figure 2-1-2: Front Panel of XGS-6320-12X4TR

■ 10 Gigabit TP interface

100/1G/2.5G/10G BASE-T Copper, RJ45 twisted-pair: Up to 100 meters

■ 10 Gigabit SFP+ slot

1G/2.5G/10GBASE-SR/LR mini-GBIC slot for SFP+ (Small Factor Pluggable Plus) transceiver module support distance from 300 meters (multi-mode fiber) to 10 kilometers (single mode fiber).

■ Console port

The console port is an RJ45 port connector. It is an interface for connecting a terminal directly. Through the console port, it provides rich diagnostic information including IP address setting, factory reset, port management, link status and system setting. Users can use the attached DB9 to RJ45 console cable in the package and connect to the console port on the device. After the connection, users can run any terminal emulation program (Hyper Terminal, ProComm Plus, Telix, Winterm and so on) to enter the startup screen of the device.

■ **Reset button**

The front panels of the XGS-6320 come with a reset button designed for rebooting the Managed Switch without turning off and on the power. The following is the summary table of reset button functions:

Reset Button Pressed and Released	Function
< 5 sec: System Reboot	Reboot the Managed Switch.
> 5 sec: Factory Default	Reset the Managed Switch to Factory Default configuration. The Managed Switch will then reboot and load the default settings as shown below: <ul style="list-style-type: none"> ◦ Default Username: admin ◦ Default Password: admin ◦ Default IP Address: 192.168.0.100 ◦ Subnet Mask: 255.255.255.0 ◦ Default Gateway: 192.168.0.254

The reset buttons of the XGS-6320 are located on the front of their panels.

2.1.2 LED Indications

The front panel LEDs indicate instant statuses of power and system, ring, port links and data activity; they help monitor and troubleshoot when needed. Figures 2-1-2-1 and 2-1-2-2 show the LED indications of the Managed Switches.

XGS-6320-8X8TR LED Indication

Figure 2-1-2-1: Front Panel of XGS-6320-8X8TR

XGS-6320-12X4TR LED Indication

Figure 2-1-2-2: Front Panel of XGS-6320-12X4TR

■ **System (XGS-6320-8X8TR / XGS-6320-12X4TR)**

LED	Color	Function
R.O.	Green	Lights to indicate that Switch has enabled Ring Owner.
Ring	Green	Lights to indicate the ERPS Ring has been created successfully
DC	Green	Lights to indicate that the Switch has power from DC source
		Off to indicate that the DC Power is inactive
AC	Green	To indicate that the Switch has power from AC source
		Off to indicate that the AC Power is inactive

■ Per 10GBASE-SR/LR SFP+ port (Port-1 to Port-8 or Port-1 to Port-12):

LED	Color	Function	
100/1G LNK/ACT	Green	Lights:	To indicate the port is running in 100Mbps or 1000Mbps speed.
		Blinks:	To indicate that the switch is actively sending or receiving data over that port.
2.5G LNK/ACT	Green + Amber	Lights:	To indicate the port is running in 2500Mbps speed.
		Blinks:	To indicate that the switch is actively sending or receiving data over that port.
10G LNK/ACT	Amber	Lights:	To indicate the port is running in 10GMbps speed and successfully established.

■ Per 10GBASE-T Interface (Port-9 to Port-16 or Port-13 to Port-16):

LED	Color	Function	
1G/2.5G LNK/ACT	Green	Lights:	To indicate the port is running at 1000Mbps or 2500Mbps .
		Blinks:	To indicate that the switch is actively sending or receiving data over that port.
10G LNK/ACT	Amber	Lights:	To indicate the port is running at 10GMbps and successfully Established.

LED	Color	Function	
100/1G LNK/ACT	Green	Lights:	To indicate the port is successfully established at 1000Mbps or 100Mbps .
		Blinks:	To indicate that the Switch is actively sending or receiving data over that port.
2.5G LNK/ACT	Green + Amber	Lights:	To indicate the port is successfully established at 2.5Gbps or 5Gbps .
		Blinks:	To indicate that the Switch is actively sending or receiving data over that port.
10G LNK/ACT	Amber	Lights:	To indicate the port is running in 10Gbps and successfully established.
		Blink:	To indicate that the Switch is actively sending or receiving data over that port.

2.1.3 Switch Rear Panel

The rear panel of the Managed Switch consists of the AC inlet power socket. [Figures 2-1-3-1](#) show the rear panels of the Managed Switches.

XGS-6320-8X8TR and XGS-6320-12X4TR Rear Panel

Figure 2-1-3-1: Rear Panel of XGS-6320 Series

■ AC Power Receptacle

For compatibility with electrical voltages in most areas of the world, the Managed Switch's power supply can automatically adjust line power in the range of 100-240V AC and 50/60 Hz.

Plug the female end of the power cord firmly into the receptacle on the rear panel of the Managed Switch and the other end of the power cord into an electrical outlet and the power will be ready.

The device is a power-required device, which means it will not work till it is powered. If your networks should be active all the time, please consider using UPS (Uninterrupted Power Supply) for your device.

Power Notice: It will prevent you from network data loss or network downtime. In some areas, installing a surge suppression device may also help to protect your Managed Switch from being damaged by unregulated surge or current to the Switch or the power adapter.

2.2 Installing the Switch

This section describes how to install your Managed Switch and make connections to the Managed Switch. Please read the following topics and perform the procedures in the order being presented. To install your Managed Switch on a desktop or shelf, simply complete the following steps.

In the installation steps below, this manual uses the XGS-6320-8X8TR as an example. However, the steps for XGS-6320-12X4TR is similar.

2.2.1 Desktop Installation

To install the Managed Switch on desktop or shelf, please follow these steps:

Step 1: Attach the rubber feet to the recessed areas on the bottom of the Managed Switch.

Step 2: Place the Managed Switch on the desktop or the shelf near an AC power source, as shown in Figure 2-2-1.

Figure 2-2-1: Place the Managed Switch on the Desktop

Step 3: Keep enough ventilation space between the Managed Switch and the surrounding objects.

When choosing a location, please keep in mind the environmental restrictions discussed in Chapter 1, Section 4, and specifications.

Step 4: Connect the Managed Switch to network devices.

Connect one end of a standard network cable to the 100/1G/2.5G/10G RJ45 ports on the front of the Managed Switch. Connect the other end of the cable to the network devices such as printer server, workstation or router.

Connection to the Managed Switch requires UTP Category 5e network cabling with RJ45 tips. For more information, please see the Cabling Specification in Appendix A.

Step 5: Supply power to the Managed Switch.

Connect one end of the power cable to the Managed Switch.

Connect the power plug of the power cable to a standard wall outlet.

When the Managed Switch receives power, the Power LED should remain solid Green.

2.2.2 Rack Mounting

To install the Managed Switch in a 19-inch standard rack, please follow the instructions described below.

Step 1: Place the Managed Switch on a hard flat surface, with the front panel positioned towards the front side.

Step 2: Attach the rack-mount bracket to each side of the Managed Switch with supplied screws attached to the package.

Figure 2-2-2 shows how to attach brackets to one side of the Managed Switch.

Figure 2-2-2: Attach Brackets to the Managed Switch.

You must use the screws supplied with the mounting brackets. Damage caused to the parts by using incorrect screws would invalidate the warranty.

Step 3: Secure the brackets tightly.

Step 4: Follow the same steps to attach the second bracket to the opposite side.

Step 5: After the brackets are attached to the Managed Switch, use suitable screws to securely attach the brackets to the rack, as shown in Figure 2-2-3.

Figure 2-2-3: Mounting Managed Switch in a Rack

Step 6: Proceed with Steps 4 and 5 of session 2.2.1 Desktop Installation to connect the network cabling and supply power to the Managed Switch.

2.2.3 Installing the SFP/SFP+ Transceiver

The sections describe how to insert an SFP/SFP+ transceiver into an SFP/SFP+ slot. The SFP/SFP+ transceivers are hot-pluggable and hot-swappable. You can plug in and out the transceiver to/from any SFP/SFP+ port without having to power down the Managed Switch, as [Figure 2-2-4](#) shows..

Figure 2-2-4: Plugging in the SFP/SFP+ Transceiver

■ Approved PLANET SFP/SFP+ Transceivers

PLANET Managed Switch supports both single mode and multi-mode SFP/SFP+ transceivers. The following list of approved PLANET SFP/SFP+ transceivers is correct at the time of publication:

Fast Ethernet Transceiver (100BASE-X SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (nm)	Operating Temp.
MFB-FX	100	LC	Multi Mode	2km	1310nm	0 ~ 60 degrees C
MFB-F20	100	LC	Single Mode	20km	1310nm	0 ~ 60 degrees C
MFB-F40	100	LC	Single Mode	40km	1310nm	0 ~ 60 degrees C
MFB-F60	100	LC	Single Mode	60km	1310nm	0 ~ 60 degrees C
MFB-F120	100	LC	Single Mode	120km	1550nm	0 ~ 60 degrees C
MFB-TFX	100	LC	Multi Mode	2km	1310nm	-40 ~ 75 degrees C
MFB-TF20	100	LC	Single Mode	20km	1550nm	-40 ~ 75 degrees C

Fast Ethernet Transceiver (100BASE-BX, Single Fiber Bi-directional SFP)

Model	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (TX/RX)	Operating Temp.
MFB-FA20	100	WDM(LC)	Single Mode	20km	1310nm/1550nm	0 ~ 60 degrees C
MFB-FB20	100	WDM(LC)	Single Mode	20km	1550nm/1310nm	0 ~ 60 degrees C
MFB-TFA20	100	WDM(LC)	Single Mode	20km	1310nm/1550nm	-40 ~ 75 degrees C
MFB-TFB20	100	WDM(LC)	Single Mode	20km	1550nm/1310nm	-40 ~ 75 degrees C
MFB-TFA40	100	WDM(LC)	Single Mode	40km	1310nm/1550nm	-40 ~ 75 degrees C
MFB-TFB40	100	WDM(LC)	Single Mode	40km	1550nm/1310nm	-40 ~ 75 degrees C

Gigabit Ethernet Transceiver (1000BASE-X SFP)

Model	DDM	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (nm)	Operating Temp.
MGB-GT	--	1000	Copper	--	100m	--	0 ~ 60 °C
MGB-SX(V2)	YES	1000	LC	Multi Mode	550m	850nm	0 ~ 60 °C
MGB-SX2(V2)	YES	1000	LC	Multi Mode	2km	1310nm	0 ~ 60 °C
MGB-LX(V2)	YES	1000	LC	Single Mode	20km	1310nm	0 ~ 60 °C
MGB-L40	YES	1000	LC	Single Mode	40km	1310nm	0 ~ 60 °C
MGB-L80	YES	1000	LC	Single Mode	80km	1550nm	0 ~ 60 °C
MGB-L120(V2)	YES	1000	LC	Single Mode	120km	1550nm	0 ~ 60 °C
MGB-TSX	YES	1000	LC	Multi Mode	550m	850nm	-40 ~ 75 °C
MGB-TSX2	YES	1000	LC	Multi Mode	2km	1310nm	-40 ~ 75 °C
MGB-TLX(V2)	YES	1000	LC	Single Mode	20km	1310nm	-40 ~ 75 °C
MGB-TL40	YES	1000	LC	Single Mode	40km	1310nm	-40 ~ 75 °C
MGB-TL80	YES	1000	LC	Single Mode	80km	1550nm	-40 ~ 75 °C

Gigabit Ethernet Transceiver (1000BASE-BX, Single Fiber Bi-directional SFP)

Model	DDM	Speed (Mbps)	Connector Interface	Fiber Mode	Distance	Wavelength (TX)	Wavelength (RX)	Operating Temp.
MGB-LA10(V2)	YES	1000	WDM(LC)	Single Mode	10km	1310nm	1550nm	0 ~ 60 °C
MGB-LB10(V2)		1000	WDM(LC)	Single Mode	10km	1550nm	1310nm	0 ~ 60 °C
MGB-LA20(V2)	YES	1000	WDM(LC)	Single Mode	20km	1310nm	1550nm	0 ~ 60 °C
MGB-LB20(V2)		1000	WDM(LC)	Single Mode	20km	1550nm	1310nm	0 ~ 60 °C
MGB-LA40(V2)	YES	1000	WDM(LC)	Single Mode	40km	1310nm	1550nm	0 ~ 60 °C
MGB-LB40(V2)		1000	WDM(LC)	Single Mode	40km	1550nm	1310nm	0 ~ 60 °C
MGB-LA80	YES	1000	WDM(LC)	Single Mode	80km	1490nm	1550nm	0 ~ 60 °C
MGB-LB80		1000	WDM(LC)	Single Mode	80km	1550nm	1490nm	0 ~ 60 °C

MTB-LB60		10G	WDM(LC)	Single Mode	60km	1330nm	1270nm	0 ~ 60 °C

It is recommended to use PLANET SFP/SFP+ on the Managed Switch. If you insert an SFP/SFP+ transceiver that is not supported, the Managed Switch will not recognize it.

1. Before we connect the XGS-6320 to the other network device, we have to make sure both sides of the SFP transceivers are with the same media type, for example, 1000BASE-SX to 1000BASE-SX, 1000BASE-LX to 1000BASE-LX.
2. Check whether the fiber-optic cable type matches with the SFP transceiver requirement.
 - To connect to 1000BASE-SX SFP transceiver, please use the multi-mode fiber cable with one side being the male duplex LC connector type.
 - To connect to 1000BASE-LX SFP transceiver, please use the single-mode fiber cable with one side being the male duplex LC connector type.

■ **Connecting the Fiber Cable**

1. Insert the duplex LC connector into the SFP/SFP+ transceiver.
2. Connect the other end of the cable to a device with SFP/SFP+ transceiver installed.
3. Check the LNK/ACT LED of the SFP/SFP+ slot on the front of the Managed Switch. Ensure that the SFP/SFP+ transceiver is operating correctly.
4. Check the Link mode of the SFP/SFP+ port if the link fails. To function with some fiber-NICs or Media Converters, user has to set the port Link mode to “**10G Force**”, or “**1000M Force**”.

■ **Removing the Transceiver Module**

1. Make sure there is no network activity anymore.
2. Remove the Fiber-Optic Cable gently.
3. Lift up the lever of the MGB module and turn it to a horizontal position.
4. Pull out the module gently through the lever.

Figure 2-2-5: How to Pull Out the SFP/SFP+ Transceiver

Note

Never pull out the module without lifting up the lever of the module and turning it to a horizontal position. Directly pulling out the module could damage the module and the SFP/SFP+ module slot of the Managed Switch.

3. SWITCH MANAGEMENT

This chapter explains the methods that you can use to configure management access to the Managed Switch. It describes the types of management applications and the communication and management protocols that deliver data between your management device (workstation or personal computer) and the system. It also contains information about port connection options.

This chapter covers the following topics:

- Requirements
- Management Access Overview
- Administration Console Access
- Web Management Access
- SNMP Access
- Standards, Protocols, and Related Reading

3.1 Requirements

- **Workstations** running Windows XP/2003/Vista/7/8/10/2008/10/11, MAC OS X or later, Linux, UNIX, or other platforms are compatible with TCP/IP protocols.
- **Workstation** is installed with **Ethernet NIC** (Network Interface Card)
- **Serial Port** connect (Terminal)
 - The above PC with COM Port (DB9/RS-232) or USB-to-RS232 converter
 - The above Workstations come with COM Port (DB9) or USB-to-RS232 converter.
 - The above Workstations have been installed with **terminal emulator**, such as Tera Term, PuTTY or Hyper Terminal included in Windows XP/2003.
 - Serial cable -- one end is attached to the RS232 serial port, while the other end to the console port of the Managed Switch.
- **Ethernet Port Connection**
 - Network cables -- Use standard network (UTP) cables with RJ45 connectors.
 - The above PC is installed with Web browser.

It is recommended to use Chrome 98.0.xxx or above to access the Managed Switch. If the Web interface of the Managed Switch is not accessible, please turn off the anti-virus software or firewall and then try it again.

3.2 Management Access Overview

The Managed Switch gives you the flexibility to access and manage it using any or all of the following methods:

- An administration **console**
- **Web browser** interface
- An external **SNMP-based network management application**

The administration console and Web browser interface support are embedded in the Managed Switch software and are available for immediate use. Each of these management methods has their own advantages. Table 3-1 compares the three management methods.

Method	Advantages	Disadvantages
Console	<ul style="list-style-type: none"> • No IP address or subnet needed • Text-based • Telnet functionality and HyperTerminal built into Windows 95/98/NT/2000/ME/XP operating systems • Secure 	<ul style="list-style-type: none"> • Must be near the switch or use dial-up connection • Not convenient for remote users • Modem connection may prove to be unreliable or slow
Web Browser	<ul style="list-style-type: none"> • Ideal for configuring the switch remotely • Compatible with all popular browsers • Can be accessed from any location • Most visually appealing 	<ul style="list-style-type: none"> • Security can be compromised (hackers need only know the IP address and subnet mask) • May encounter lag times on poor connections
SNMP Agent	<ul style="list-style-type: none"> • Communicates with switch functions at the MIB level • Based on open standards 	<ul style="list-style-type: none"> • Requires SNMP manager software • Least visually appealing of all three methods • Some settings require calculations • Security can be compromised (hackers need only know the community name)

Table 3-1: Comparison of Management Methods

3.3 Administration Console

The administration console is an internal, character-oriented, and command line user interface for performing system administration such as displaying statistics or changing option settings. Using this method, you can view the administration console from a terminal, personal computer, Apple Macintosh, or workstation connected to the Managed Switch's console (serial) port.

Figure 3-1: Console Management

Direct Access

Direct access to the administration console is achieved by directly connecting a terminal or a PC equipped with a terminal-emulation program (such as **HyperTerminal**) to the Managed Switch console (serial) port. When using this management method, a **straight DB9 RS232 cable** is required to connect the switch to the PC. After making this connection, configure the terminal-emulation program to use the following parameters:

The default parameters are:

- 115200 bps
- 8 data bits
- No parity
- 1 stop bit

Figure 3-2: Terminal Parameter Settings

You can change these settings, if desired, after you log on. This management method is often preferred because you can remain connected and monitor the system during system reboots. Also, certain error messages are sent to the serial port, regardless of the interface through which the associated action was initiated. A Macintosh or PC attachment can use any terminal-emulation program for connecting to the terminal serial port. A workstation attachment under UNIX can use an emulator such as TIP.

3.4 Web Management

The Managed Switch offers management features that allow users to manage the Managed Switch from anywhere on the network through a standard browser such as Google Chrome. After you set up your IP address for the switch, you can access the Managed Switch's Web interface applications directly in your Web browser by entering the IP address of the Managed Switch.

Figure 3-1-3: Web Management

You can then use your Web browser to list and manage the Managed Switch configuration parameters from one central location, just as if you were directly connected to the Managed Switch's console port. Web Management requires either Google Chrome or above Web browser.

Figure 3-1-4: Web Main Screen of Managed Switch

3.5 SNMP-based Network Management

You can use an external SNMP-based application to configure and manage the Managed Switch, such as SNMP Network Manager, HP Openview Network Node Management (NNM) or What's Up Gold. This management method requires the SNMP agent on the switch and the SNMP Network Management Station to use the **same community string**. This management method, in fact, uses two community strings: the **get community** string and the **set community** string. If the SNMP Network management Station only knows the set community string, it can read and write to the MIBs. However, if it only knows the get community string, it can only read MIBs. The default getting and setting community strings for the Managed Switch is public.

Figure 3-1-5: SNMP Management

3.6 PLANET Smart Discovery Utility

For easily listing the Managed Switch in your Ethernet environment, the Planet Smart Discovery Utility from user's manual CD-ROM is an ideal solution. The following installation instructions are to guide you to running the Planet Smart Discovery Utility.

1. Deposit the Planet Smart Discovery Utility in administrator PC.
2. Run this utility as the following screen appears.

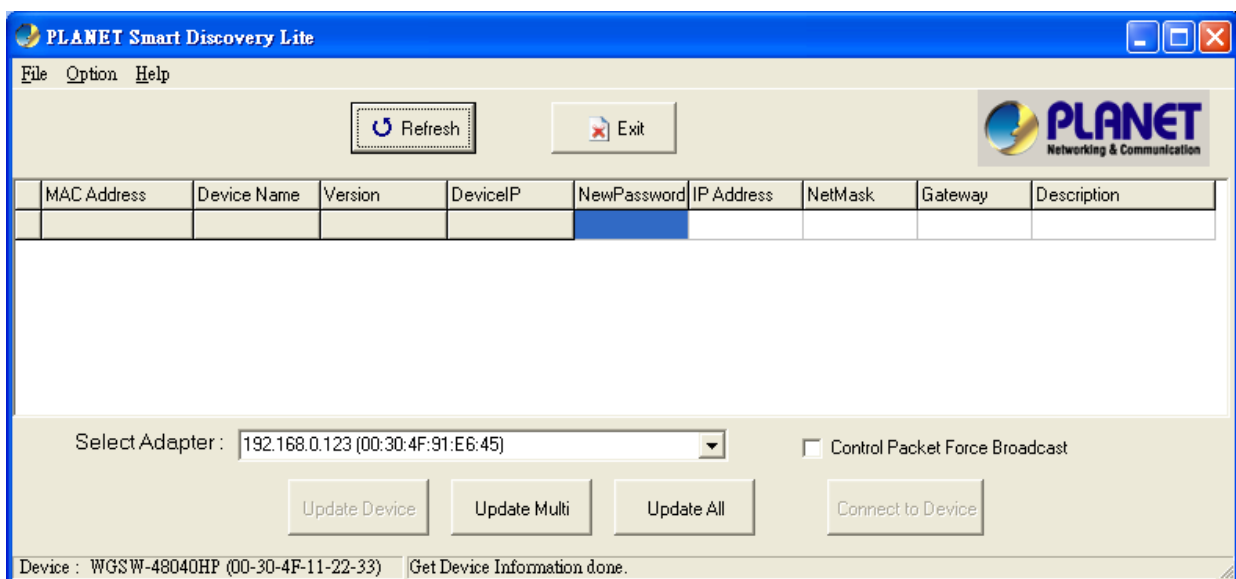

Figure 3-1-6: Planet Smart Discovery Utility Screen

If there are two LAN cards or above in the same administrator PC, choose a different LAN card by using the “**Select Adapter**” tool.

3. Press the “**Refresh**” button for the currently connected devices in the discovery list as the screen shows below:

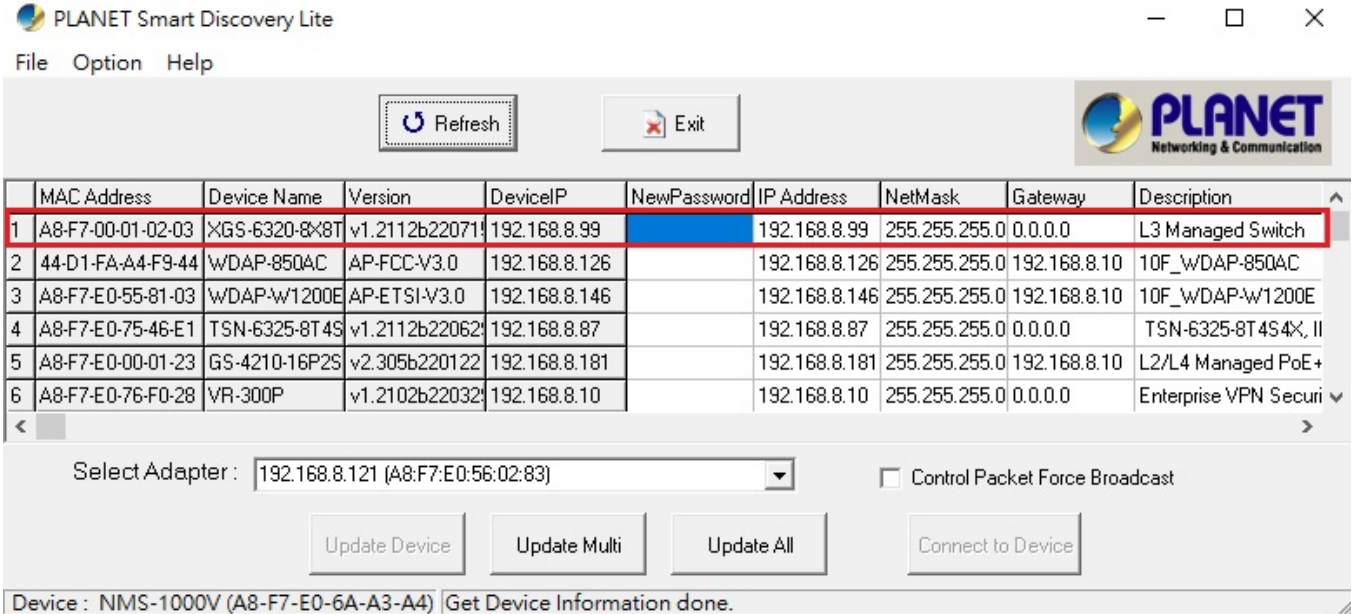

Figure 3-1-7: Planet Smart Discovery Utility Screen

1. This utility shows all necessary information from the devices, such as MAC address, device name, firmware version, and device IP subnet address. It can also assign new password, IP subnet address and description to the devices.
2. After setup is completed, press the “**Update Device**”, “**Update Multi**” or “**Update All**” button to take effect. The functions of the 3 buttons above are shown below:
 - **Update Device:** use current setting on one single device.
 - **Update Multi:** use current setting on choose multi-devices.
 - **Update All:** use current setting on whole devices in the list.

The same functions mentioned above also can be found in “**Option**” tools bar.

3. To click the “**Control Packet Force Broadcast**” function, it allows you to assign a new setting value to the Web Smart Switch under a different IP subnet address.
4. Press the “**Connect to Device**” button and the Web login screen appears in [Figure 3-1-4](#).
5. Press the “**Exit**” button to shut down the Planet Smart Discovery Utility.

4. WEB CONFIGURATION

This section introduces the configuration and functions of the Web-based management from Managed Switch.

About Web-based Management

The Managed Switch offers management features that allow users to manage the Managed Switch from anywhere on the network through a standard browser such as Google Chrome.

The Web-based Management supports Google Chrome. It is based on Java Applets with an aim to reduce network bandwidth consumption, enhance access speed and present an easy viewing screen.

By default, Google Chrome or later version does not allow Java Applets to open sockets. The user has to explicitly modify the browser setting to enable Java Applets to use network ports.

The Managed Switch can be configured through an Ethernet connection, making sure the manager PC must be set to the same IP subnet address with the Managed Switch.

For example, the default IP address of the Managed Switch is **192.168.0.100**, then the manager PC should be set to **192.168.0.x** (where x is a number between 1 and 254, except 100), and the default subnet mask is 255.255.255.0.

If you have changed the default IP address of the Managed Switch to 192.168.1.1 with subnet mask 255.255.255.0 via console, then the manager PC should be set to 192.168.1.x (where x is a number between 2 and 254) to do the relative configuration on manager PC.

Figure 4-1-1: Web Management

■ Logging on to the Managed Switch

1. Use Google Chrome or above Web browser. Enter the factory-default IP address to access the Web interface. The factory-default IP address is shown as follows:

<http://192.168.0.100>

- When the following login screen appears, please enter the default username "admin" with password "admin" (or the username/password you have changed via console) to log in the main screen of Managed Switch. The login screen in Figure 4-1-2 appears.

Figure 4-1-2: Login Screen

Default User name: **admin**

Default Password: **admin**

After entering the username and password, the main screen appears as shown in Figure 4-1-3.

Figure 4-1-3: Web Main Page

Now, you can use the Web management interface to continue the switch management or manage the Managed Switch by Web interface. The Switch Menu on the left of the web page lets you access all the commands and statistics the Managed Switch provides.

1. It is recommended to use Mozilla Firefox 1.5 or above to access Managed Switch.
2. The changed IP address takes effect immediately after clicking on the **Save** button. You need to use the new IP address to access the Web interface.
3. For security reason, please change and memorize the new password after this first setup.
4. Only accept command in lowercase letter under web interface.

4.1 Main Web Page

The Managed Switch provides a Web-based browser interface for configuring and managing it. This interface allows you to access the Managed Switch using the Web browser of your choice. This chapter describes how to use the Managed Switch's Web browser interface to configure and manage it.

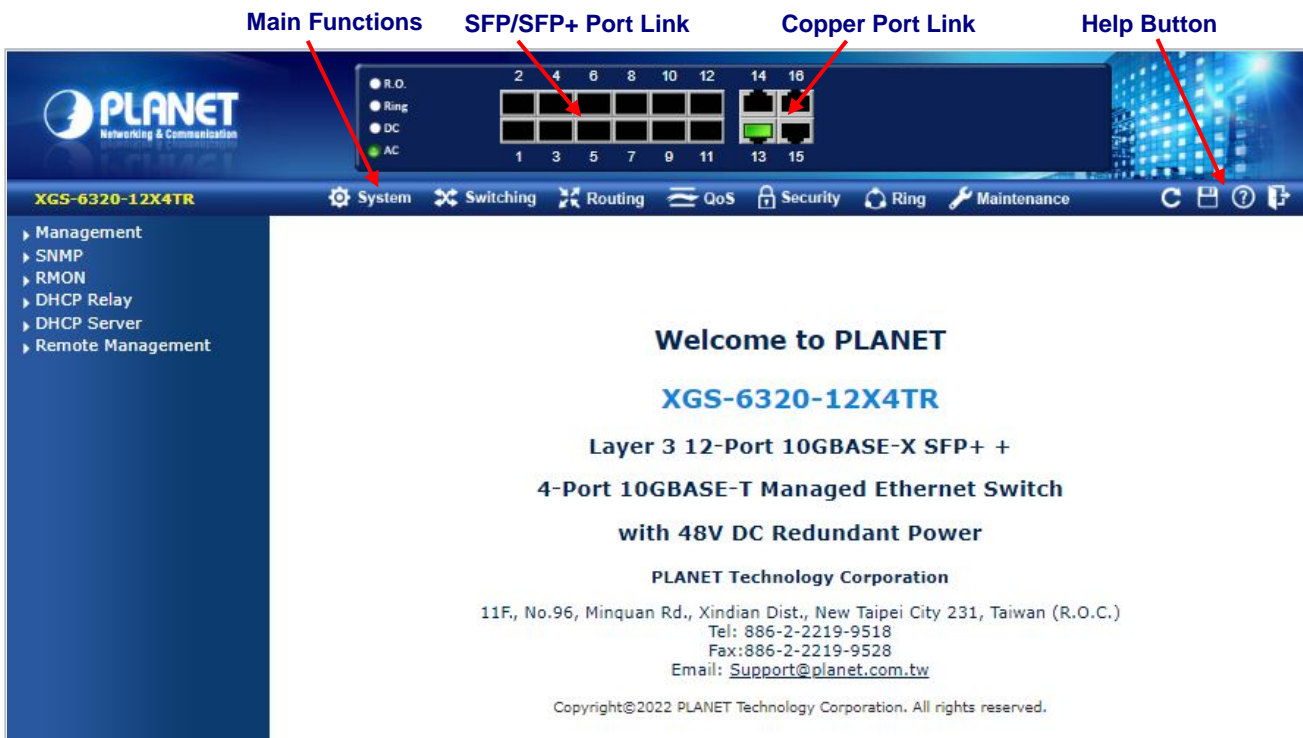

Figure 4-1-4: Web Main Page

Panel Display

The web agent displays an image of the Managed Switch's ports. The Mode can be set to display different information for the ports, including Link up or Link down. Clicking on the image of a port opens the **Port Statistics** page.

The port status is illustrated as follows:

State	Disabled	Down	Link
RJ45 Ports			
SFP+ Ports			

Main Menu

Using the onboard web agent, you can define system parameters, manage and control the Managed Switch, and all its ports, or monitor network conditions. Via the Web-Management, the administrator can set up the Managed Switch by selecting the functions those listed in the Main Function. The screen in [Figure 4-1-5](#) appears.

Figure 4-1-5: Managed Switch Main Functions Menu

4.2 System

Use the System menu items to display and configure basic administrative details of the Managed Switch. Under the System, the following topics are provided to configure and view the system information. This section has the following items:

- **System Information** The Managed Switch system information is provided here.
- **IP Configuration** Configure the IPv4/IPv6 interface and IP routes of the Managed Switch on this page.
- **IP Status** This page displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status.
- **ARP** This page to setting ARP Table Configuration
- **Users Configuration** This page provides an overview of the current users. Currently the only way to login as another user on the web server is to close and reopen the browser.

- **Privilege Levels** This page provides an overview of the privilege levels.
- **NTP Configuration** Configure NTP server on this page.
- **Time Configuration** Configure time parameter on this page.
- **UPnP** Configure UPnP on this page.
- **CPU Load** This page displays the CPU load, using an SVG graph.
- **System Log** The system log information of the Managed Switch system is provided here.
- **Detailed Log** The detailed log information of the Managed Switch system is provided here.
- **Remote Syslog** Configure remote syslog on this page.
- **SMTP Configuration** Configure SMTP parameters on this page.
- **SNMP** Configure SNMP parameters on this page
- **RMON** Configure the RMON parameters on this page
- **DHCP Relay** Configure the DHCP Relay Configuration on this page.
- **DHCP server** Configure the DHCP server on this page
- **Remote Management** Configure the Remote NMS Configuration on this page

4.2.1 Management

4.2.1.1 System Information

The System Information page provides information for the current device information. System Information page helps a switch administrator to identify the hardware MAC address, software version and system uptime. The screen in [Figure 4-2-1-1](#) appears.

System Information	
System	
Contact	Default Contact
Name	XGS-6320-12X4TR
Location	Default Location
Hardware	
MAC Address	a8-f7-e0-22-22-88
Power Status	DC PWR:OFF AC PWR :ON
Smart Fan	Low Speed
Time	
System Date	2022-07-08T16:03:04+00:00
System Uptime	0d 04:05:56
Software	
Software Version	v1.2112b220708
Software Date	2022-07-08T11:57:12+08:00

Auto-refresh

Figure 4-2-1-1: System Information Page Screenshot

The page includes the following fields:

Object	Description
• Contact	The system contact configured in SNMP System Information System Contact.
• Name	The system name configured in SNMP System Information System Name.
• Location	The system location configured in SNMP System Information System Location.
• MAC Address	The MAC Address of this Managed Switch.
• Temperature	Indicates chipset temperature.
• Power Status	The status of power input (AC and DC)
• Smart Fan	The status are show Smart Fan speed.
• System Date	The current (GMT) system time and date. The system time is obtained through the configured NTP Server, if any.
• System Uptime	The period of time the device has been operational.
• Software Version	The software version of the Managed Switch.
• Software Date	The date when the Managed Switch software was produced.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.2.1.2 IP Configuration

The IP Configuration includes the IP Configuration, IP Interface and IP Routes. The configured column is used to view or change the IP configuration. The maximum number of interfaces supported is 128 and the maximum number of routes is 128. The screen in [Figure 4-2-1-2](#) appears.

IP Configuration

Domain Name	No Domain Name <input type="text"/>	
Mode	Host <input type="text"/>	
DNS Server 1	No DNS server <input type="text"/>	
DNS Server 2	No DNS server <input type="text"/>	
DNS Server 3	No DNS server <input type="text"/>	
DNS Proxy	<input type="checkbox"/>	

IP Interfaces

Delete	IF	Enable	DHCPv4				Hostname	Fallback	Current Lease	IPv4		DHCPv6			IPv6	
			Type	IFMac	ASCII	HEX				Address	Mask Length	Enable	Rapid Commit	Current Lease	Address	Mask Length
<input type="checkbox"/>	VLAN 1	<input type="checkbox"/>	Auto	Port 1				0	192.168.0.100	24	<input type="checkbox"/>	<input type="checkbox"/>				

IP Routes

Delete	Network	Mask Length	Gateway	Next Hop VLAN (IPv6)	Distance
<input type="button" value="Add Route"/>					
<input type="button" value="Apply"/> <input type="button" value="Reset"/>					

Figure 4-2-1-2: IP Configuration Page Screenshot

The current column is used to show the active IP configuration.

Object	Description
<ul style="list-style-type: none"> IP Configurations 	<p>Domain Name</p> <p>Configure the Switch Domain Name</p>
	<p>Mode</p> <p>Configure whether the IP stack should act as a Host or a Router. In Host mode, IP traffic between interfaces will not be routed. In Router mode traffic is routed between all interfaces.</p>
	<p>DNS Server</p> <p>This setting controls the DNS name resolution done by the switch. The following modes are supported:</p> <ul style="list-style-type: none"> ■ No DNS server No DNS server will be used.. ■ Configure IPv4 or IPv6 Explicitly specify the name of local domain. Make sure the configured domain name meets your organization's given domain. ■ From any DHCPv6 interfaces The first domain name offered from a DHCPv6 lease to a DHCPv6-enabled interface will be used. ■ From this DHCPv6 interface Specify from which DHCPv6-enabled interface a provided domain name should be preferred.

	DNS Proxy	When DNS proxy is enabled, system will relay DNS requests to the currently configured DNS server, and reply as a DNS resolver to the client devices on the network.	
• IP Interface	Delete	Select this option to delete an existing IP interface.	
	VLAN	The VLAN associated with the IP interface. Only ports in this VLAN will be able to access the IP interface. This field is only available for input when creating a new interface.	
	IPv4 DHCP	Enabled	Enable the DHCP client by checking this box.
		Fallback	The number of seconds for trying to obtain a DHCP lease.
		Current Lease	For DHCP interfaces with an active lease, this column shows the current interface address, as provided by the DHCP server.
	IPv4	Address	Provide the IP address of this Managed Switch in dotted decimal notation.
		Mask Length	The IPv4 network mask, in number of bits (<i>prefix length</i>). Valid values are between 0 and 30 bits for an IPv4 address.
	DHCPv6	Enable	Enable the DHCPv6 client by checking this box. If this option is enabled, the system will configure the IPv6 address of the interface using the DHCPv6 protocol
		Rapid Commit	Enable the DHCPv6 Rapid-Commit option by checking this box. If this option is enabled, the DHCPv6 client terminates the waiting process as soon as a Reply message with a Rapid Commit option is received. This option is only manageable when DHCPv6 client is enabled.
		Current Lease	For DHCPv6 interface with an active lease, this column shows the interface address provided by the DHCPv6 server
	IPv6	Address	Provide the IP address of this Managed Switch. An IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:).
		Mask Length	The IPv6 network mask, in number of bits (<i>prefix length</i>). Valid values are between 1 and 128 bits for an IPv6 address.
• IP Routes	Delete	Select this option to delete an existing IP route.	
	Network	The destination IP network or host address of this route. Valid format is dotted decimal notation or a valid IPv6 notation. A default route can use the value 0.0.0.0 or IPv6 :: notation.	
	Mask Length	The destination IP network or host mask, in number of bits (<i>prefix length</i>).	
	Gateway	The IP address of the IP gateway. Valid format is dotted decimal notation or a valid IPv6 notation. Gateway and Network must be of the same type.	
	Next Hop VLAN	The VLAN ID (VID) of the specific IPv6 interface associated with the gateway.	

Buttons

: Click to add a new IP interface. A maximum of 128 interfaces are supported.

: Click to add a new IP route. A maximum of 32 routes are supported.

Apply : Click to apply changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.2.1.3 IP Status

IP Status displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status. The screen in [Figure 4-2-1-3](#) appears.

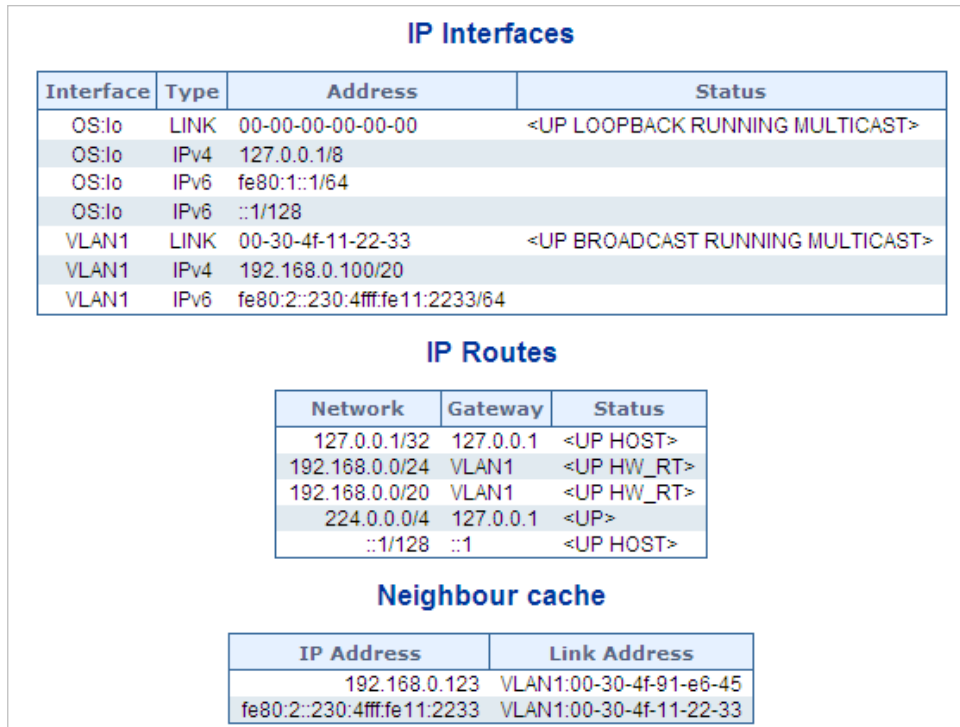

Figure 4-2-1-3: IP Status Page Screenshot

The page includes the following fields:

Object	Description	
• IP Interfaces	Interface	The name of the interface.
	Type	The address type of the entry. This may be LINK or IPv4 .
	Address	The current address of the interface (of the given type).
	Status	The status flags of the interface (and/or address).
• IP Routes	Network	The destination IP network or host address of this route.
	Gateway	The gateway address of this route.
	Status	The status flags of the route.
• Neighbor Cache	IP Address	The IP address of the entry.
	Link Address	The Link (MAC) address for which a binding to the IP address given exists.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page.

4.2.1.4 ARP

This page provides ARP configuration settings. press the “Apply” button to take effect, the screen in [Figure 4-2-1-4](#) appears.

-  : Click to apply changes.
-  : Click to undo any changes made locally and revert to previously saved values.
-  : Click to undo any changes made locally and return to the Users.
-  : Delete the current user. This button is not available for new configurations (Add new user).

Once the new user is added, the new user entry is shown on the Users Configuration page.

If you forget the new password after changing the default password, please press the **“Reset”** button on the front panel of the Managed Switch for over 10 seconds and then release it. The current setting including VLAN will be lost and the Managed Switch will restore to the default mode.

4.2.1.6 Privilege Levels

This page provides an overview of the privilege levels. After setup is completed, please press the “**Apply**” button to take effect. Please login web interface with new user name and password and the screen in [Figure 4-2-1-6](#) appears.

Privilege Level Configuration

Figure 4-2-1-6: Privilege Levels Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Group Name 	<p>The name identifying the privilege group. In most cases, a privilege level group consists of a single module (e.g. LACP, RSTP or QoS), but a few of them contain more than one. The following description defines these privilege level groups in details:</p> <ul style="list-style-type: none"> ■ System: Contact, Name, Location, Timezone, Log. ■ Security: Authentication, System Access Management, Port (contains Dot1x port, MAC based and the MAC Address Limit), ACL, HTTPS, SSH, ARP Inspection and IP source guard. ■ IP: Everything except 'ping'. ■ Port: Everything except 'VeriPHY'. ■ Diagnostics: 'ping' and 'VeriPHY'. ■ Maintenance: CLI- System Reboot, System Restore Default, System Password, Configuration Save, Configuration Load and Firmware Load. Web- Users, Privilege Levels and everything in Maintenance. ■ Debug: Only present in CLI.
<ul style="list-style-type: none"> • Privilege Level 	<p>Every privilege level group has an authorization level for the following sub groups:</p> <ul style="list-style-type: none"> ■ Configuration read-only ■ Configuration/execute read-write ■ Status/statistics read-only ■ Status/statistics read-write (e.g. for clearing of statistics).

Buttons

: Click to apply changes.

: Click to undo any changes made locally and revert to previously saved values.

4.2.1.7 NTP Configuration

Configure NTP on this page. **NTP** is an acronym for **Network Time Protocol**, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (data grams) as transport layer. You can specify NTP Servers. The NTP Configuration screen in [Figure 4-2-1-7](#) appears.

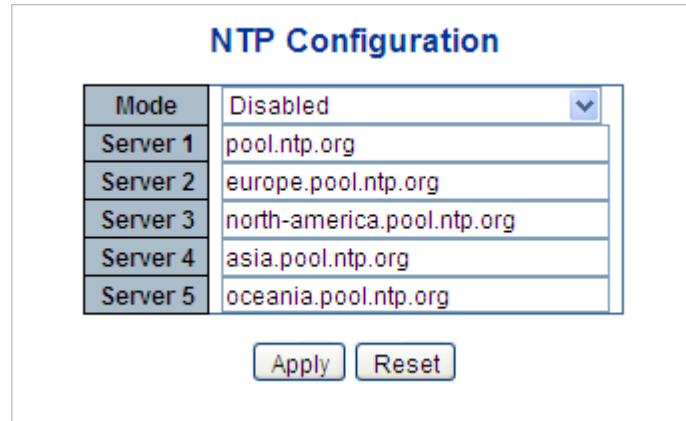

Figure 4-2-1-7: NTP Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Indicates the NTP mode operation. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable NTP mode operation. When enabling NTP mode operation, the agent forward and transfer NTP messages between the clients and the server when they are not on the same subnet domain. ■ Disabled: Disable NTP mode operation.
<ul style="list-style-type: none"> • Server # 	<p>Provide the NTP IPv4 or IPv6 address of this switch. IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:).</p> <p>For example, 'fe80::215:c5ff:fe03:4dc7'. The symbol '::' is a special syntax that can be used as a shorthand way of representing multiple 16-bit groups of contiguous zeros, but it can only appear once. It also uses a legal IPv4 address like ':::192.1.2.34'.</p>

Buttons

: Click to apply changes.

: Click to undo any changes made locally and revert to previously saved values.

4.2.1.8 Time Configuration

Configure Time Zone on this page. A **Time Zone** is a region that has a uniform standard time for legal, commercial, and social purposes. It is convenient for areas in close commercial or other communication to keep the same time, so time zones tend to follow the boundaries of countries and their subdivisions. The Time Zone Configuration screen in Figure 4-2-1-9 appears

Time Zone Configuration

Time Zone Configuration	
Time Zone	(UTC) Coordinated Universal Time ▼
Hours	0 ▼
Minutes	0 ▼
Acronym	<input type="text"/> (0 - 16 characters)

Time Zone Configuration

Object	Description
• Time Zone	Lists various Time Zones world wide. Select appropriate Time Zone from the drop down and click Save to set. The 'Manual Setting' options is used for the specific time zone which is excluded from the options list.
• Hours	Number of hours offset from UTC. The field only available when time zone manual setting.
• Minutes	Number of minutes offset from UTC. The field only available when time zone manual setting.
• Acronym	User can set the acronym of the time zone. This is a User configurable acronym to identify the time zone. (Range : Up to 16 characters) Notice the string " " is a special syntax that is reserved for null input.

4.2.1.9 UPnP

Configure UPnP on this page. UPnP is an acronym for **Universal Plug and Play**. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components. The UPnP Configuration screen in [Figure 4-2-1-10-1](#) appears.

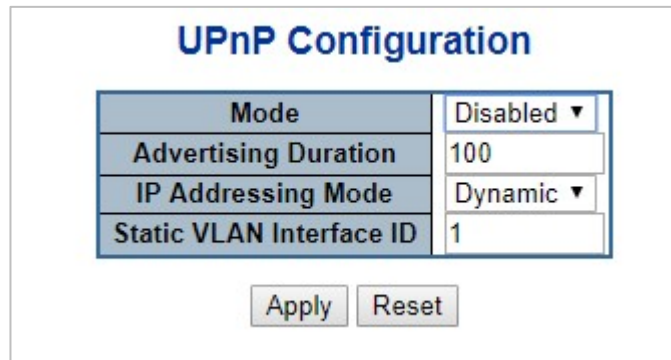

Figure 4-2-1-10-1: UPnP Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Indicates the UPnP operation mode. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable UPnP mode operation. ■ Disabled: Disable UPnP mode operation. <p>When the mode is enabled, two ACEs are added automatically to trap UPnP related packets to CPU. The ACEs are automatically removed when the mode is disabled.</p>

<ul style="list-style-type: none"> • Advertising Duration 	<p>The duration, carried in SSDP packets, is used to inform a control point or control points how often it or they should receive a SSDP advertisement message from this switch. If a control point does not receive any message within the duration, it will think that the switch no longer exists. Due to the unreliable nature of UDP, in the standard it is recommended that such refreshing of advertisements to be done at less than one-half of the advertising duration. In the implementation, the switch sends SSDP messages periodically at the interval one-half of the advertising duration minus 30 seconds. Valid values are in the range 100 to 86400.</p>
<ul style="list-style-type: none"> • IP Addressing Mode 	<p>IP addressing mode provides two ways to determine IP address assignment:</p> <p>Dynamic: Default selection for UPnP. UPnP module helps users choosing the IP address of the switch device. It finds the first available system IP address.</p> <p>Static: User specifies the IP interface VLAN for choosing the IP address of the switch device.</p>
<ul style="list-style-type: none"> • Static VLAN Interface ID 	<p>The index of the specific IP VLAN interface. It will only be applied when IP Addressing Mode is static. Valid configurable values ranges from 1 to 4095. Default value is 1.</p>

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

Figure 4-2-1-10-2: UPnP devices Shown on Windows My Network Place

4.2.1.10 CPU Load

This page displays the CPU load, using an SVG graph. The load is measured as average over the last 100ms, 1 sec and 10 seconds intervals. The last 120 samples are graphed, and the last numbers are displayed as text as well. In order to display the SVG graph, your browser must support the SVG format. Consult the SVG Wiki for more information on browser support.

Specifically, at the time of writing, Google Chrome will need to have a plugin installed to support SVG. The CPU Load screen in [Figure 4-2-1-11](#) appears.

Figure 4-2-1-11: CPU Load Page Screenshot

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

If your browser cannot display anything on this page, please download Adobe SVG tool and install it in your computer.

4.2.1.11 System Log

The Managed Switch system log information is provided here. The System Log screen in [Figure 4-2-1-12](#) appears.

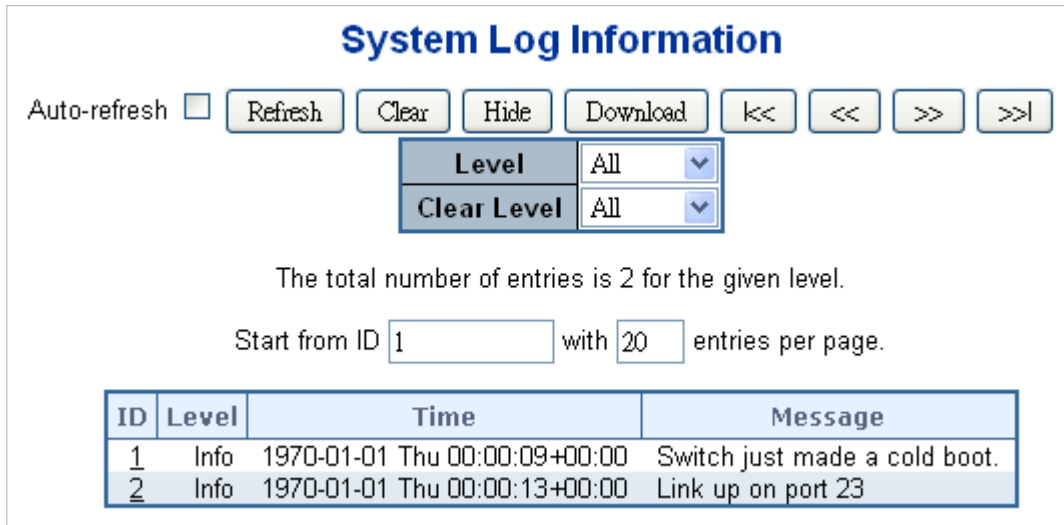

Figure 4-2-1-12: System Log Page Screenshot

The page includes the following fields:

Object	Description
• ID	The ID (≥ 1) of the system log entry.
• Level	The level of the system log entry. The following level types are supported: <ul style="list-style-type: none"> ■ Info: Information level of the system log. ■ Warning: Warning level of the system log. ■ Error: Error level of the system log. ■ All: All levels.
• Clear Level	To clear the system log entry level. The following level types are supported: <ul style="list-style-type: none"> ■ Info: Information level of the system log. ■ Warning: Warning level of the system log. ■ Error: Error level of the system log. ■ All: All levels.
• Time	The time of the system log entry.
• Message	The message of the system log entry.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Updates the system log entries, starting from the current entry ID.

Clear : Flushes the selected log entries.

Hide : Hides the selected log entries.

Download : Downloads the selected log entries.

-  : Updates the system log entries, starting from the first available entry ID.
-  : Updates the system log entries, ending at the last entry currently displayed.
-  : Updates the system log entries, starting from the last entry currently displayed.
-  : Updates the system log entries, ending at the last available entry ID.

4.2.1.12 Detailed Log

The Managed Switch system detailed log information is provided here. The Detailed Log screen in [Figure 4-2-1-13](#) appears.

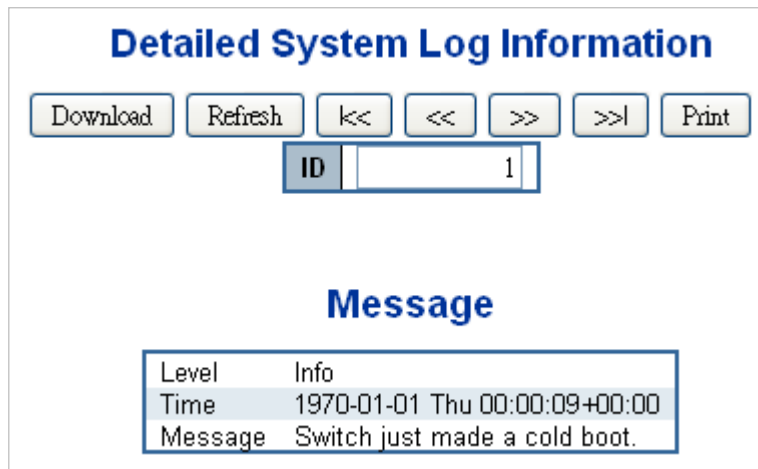

Figure 4-2-1-13: Detailed Log Page Screenshot

The page includes the following fields:

Object	Description
• ID	The ID (≥ 1) of the system log entry.
• Message	The message of the system log entry.

Buttons

-  : Download the system log entry to the current entry ID.
-  : Updates the system log entry to the current entry ID.
-  : Updates the system log entry to the first available entry ID.
-  : Updates the system log entry to the previous available entry ID.
-  : Updates the system log entry to the next available entry ID.
-  : Updates the system log entry to the last available entry ID.
-  : Print the system log entry to the current entry ID.

4.2.1.13 Remote Syslog

Configure remote syslog on this page. The Remote Syslog screen in [Figure 4-2-1-14](#) appears.

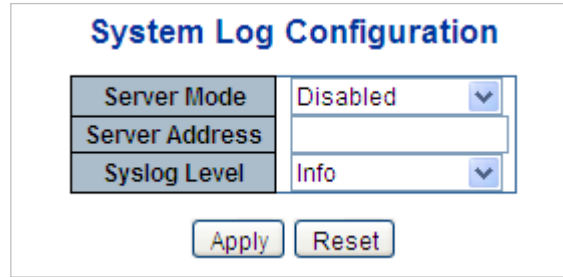

Figure 4-2-1-14: Remote Syslog Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Indicates the server mode operation. When the mode operation is enabled, the syslog message will send out to syslog server. The syslog protocol is based on UDP communication and received on UDP port 514 and the syslog server will not send acknowledgments back sender since UDP is a connectionless protocol and it does not provide acknowledgments. The syslog packet will always send out even if the syslog server does not exist. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable remote syslog mode operation. ■ Disabled: Disable remote syslog mode operation.
<ul style="list-style-type: none"> • Syslog Server IP 	<p>Indicates the IPv4 host address of syslog server. If the switch provides DNS feature, it also can be a host name.</p>
<ul style="list-style-type: none"> • Syslog Level 	<p>Indicates what kind of message will send to syslog server. Possible modes are:</p> <ul style="list-style-type: none"> ■ Info: Send information, warnings and errors. ■ Warning: Send warnings and errors. ■ Error: Send errors.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.1.14 SMTP Configuration

This page facilitates an SMTP Configuration on the switch. The SMTP Configure screen in [Figure 4-2-1-15](#) appears.

SMTP Configuration	
SMTP Mode	<input type="checkbox"/> Enable
SMTP Server	planet.com.tw (< 128 Digits) <input type="button" value="test"/>
SMTP Port	25 (1 ~ 65535)
SMTP Authentication	<input type="checkbox"/> Enable
Authentication User Name	1234 (< 64 Digits)
Authentication Password	●●●● (< 21 Digits)
E-mail From	abcd@planet.com.tw (< 128 Digits)
E-mail Subject	PLANET (< 64 Digits)
E-mail 1 To	abcd@planet.com.tw (< 128 Digits)
E-mail 2 To	abcd@planet.com.tw (< 128 Digits)
<input type="button" value="Save"/> <input type="button" value="Reset"/>	

Figure 4-2-1-15: SMTP Configuration Page Screenshot

The page includes the following fields:

Object	Description
• SMTP Mode	Controls whether SMTP is enabled on this switch.
• SMTP Server	Type the SMTP server name or the IP address of the SMTP server.
• SMTP Port	Set port number of SMTP service.
• SMTP Authentication	Controls whether SMTP authentication is enabled if authentication is required when an e-mail is sent.
• Authentication User Name	Type the user name for the SMTP server if Authentication is Enabled.
• Authentication Password	Type the password for the SMTP server if Authentication is Enabled.
• E-mail From	Type the sender's e-mail address. This address is used for reply e-mails.
• E-mail Subject	Type the subject/title of the e-mail.
• E-mail 1 To	Type the receiver's e-mail address.
• E-mail 2 To	

Buttons

: Send a test mail to mail server to check whether this account is available or not.

: Click to save changes.

: Click to undo any changes made locally and revert to previously saved values.

4.2.2 SNMP

4.2.2.1 SNMP Overview

The Simple Network Management Protocol (SNMP) is an application layer protocol that facilitates the exchange of management information between network devices. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

An SNMP-managed network consists of three key components: Network management stations (NMSs), SNMP agents, Management information base (MIB) and network-management protocol:

- **Network management stations (NMSs):** Sometimes called consoles, these devices execute management applications that monitor and control network elements. Physically, NMSs are usually engineering workstation-caliber computers with fast CPUs, megapixel color displays, substantial memory, and abundant disk space. At least one NMS must be present in each managed environment.
- **Agents:** Agents are software modules that reside in network elements. They collect and store management information such as the number of error packets received by a network element.
- **Management information base (MIB):** A MIB is a collection of managed objects residing in a virtual information store. Collections of related managed objects are defined in specific MIB modules.
- **Network-management protocol:** A management protocol is used to convey management information between agents and NMSs. SNMP is the Internet community's de facto standard management protocol.

Figure 4-2-2-1:

SNMP Operations

SNMP itself is a simple request/response protocol. NMSs can send multiple requests without receiving a response.

- **Get** -- Allows the NMS to retrieve an object instance from the agent.
- **Set** -- Allows the NMS to set values for object instances within an agent.
- **Trap** -- Used by the agent to asynchronously inform the NMS of some event. The SNMPv2 trap message is designed to replace the SNMPv1 trap message.

SNMP Community

An SNMP community is the group that devices and management stations running SNMP belong to. It helps define where information is sent. The community name is used to identify the group. An SNMP device or agent may belong to more than one SNMP community. It will not respond to requests from management stations that do not belong to one of its communities.

SNMP default communities are:

- **Write** = private
- **Read** = public

Use the SNMP Menu to display or configure the Managed Switch's SNMP function. This section has the following items:

- **System Configuration** Configure SNMP on this page.
- **System Information** The system information is provided here.
- **SNMP Trap Configuration** Configure SNMP trap on this page.
- **SNMPv3 Communities** Configure SNMPv3 communities table on this page.
- **SNMPv3 Users** Configure SNMPv3 users table on this page.
- **SNMPv3 Groups** Configure SNMPv3 groups table on this page.
- **SNMPv3 Views** Configure SNMPv3 views table on this page.
- **SNMPv3 Access** Configure SNMPv3 accesses table on this page.

4.2.2.2 System Configuration

Configure SNMP on this page. The SNMP System Configuration screen in [Figure 4-2-2-2](#) appears.

Figure 4-2-2-2: SNMP System Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	Indicates the SNMP mode operation. Possible modes are: <ul style="list-style-type: none"> ■ Enabled: Enable SNMP mode operation. ■ Disabled: Disable SNMP mode operation.
<ul style="list-style-type: none"> • Engine ID 	Indicates the SNMPv3 engine ID. The string must contain an even number between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not allowed. Change of the Engine ID will clear all original local users.

Buttons

 : Click to apply changes

 : Click to undo any changes made locally and revert to previously saved values.

4.2.2.3 System Information

The switch system information is provided here. The SNMP System Information screen in [Figure 4-2-2-3](#) appears.

Figure 4-2-2-3: System Information Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • System Contact 	The textual identification of the contact person for this managed node, together with information on how to contact this person. The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.
<ul style="list-style-type: none"> • System Name 	An administratively assigned name for this managed node. By convention, this is the node's fully-qualified domain name. A domain name is a text string drawn from the alphabet (A-Za-z), digits (0-9), minus sign (-). No space characters are permitted as part of a name. The first character must be an alpha character. And the first or last character must not be a minus sign. The allowed string length is 0 to 255.
<ul style="list-style-type: none"> • System Location 	The physical location of this node(e.g., telephone closet, 3rd floor). The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 32 to 126.

4.2.2.4 SNMP Trap Configuration

Configure SNMP trap on this page. The SNMP Trap Configuration screen in Figure 4-2-2-4 appears.

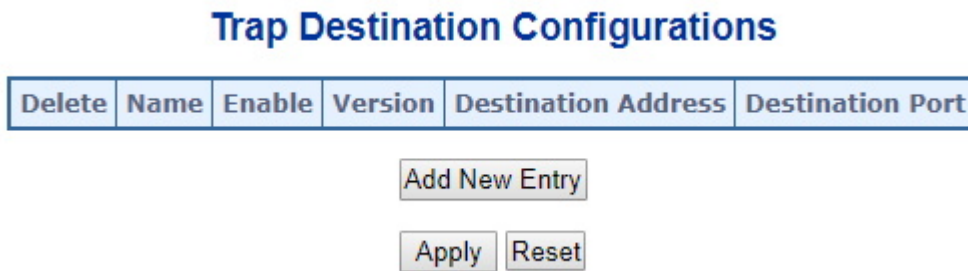

Figure 4-2-2-4-1: SNMP Trap Destination Configuration Page Screenshot

Click 'Add New Entry' and then the SNMP Trap Configuration page appears.

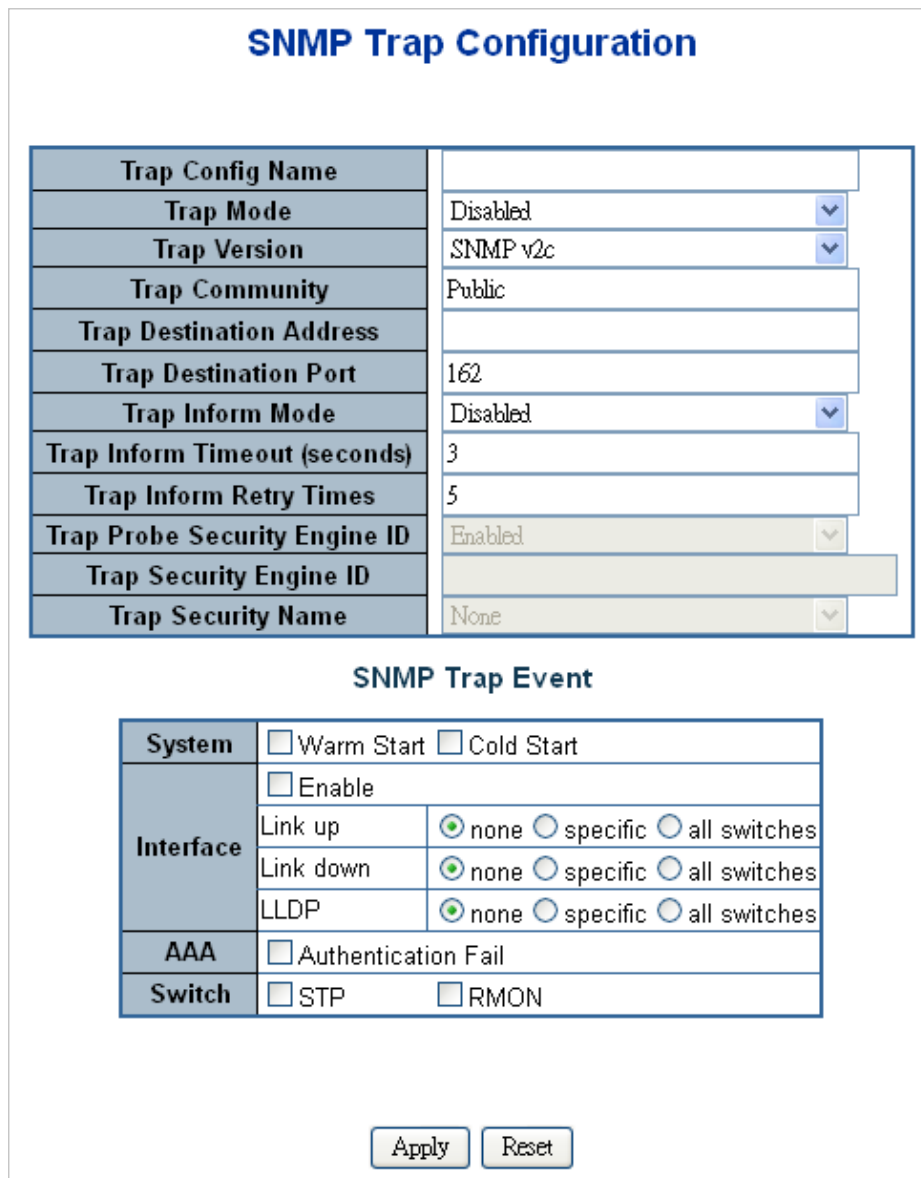

Figure 4-2-2-4-2: SNMP Trap Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Trap Config	Indicates which trap Configuration's name for configuring. The allowed string length is 0 to 255, and the allowed content is ASCII characters from 33 to 126.
• Trap Mode	Indicates the SNMP trap mode operation. Possible modes are: <ul style="list-style-type: none"> ■ Enabled: Enable SNMP trap mode operation. ■ Disabled: Disable SNMP trap mode operation.
• Trap Version	Indicates the SNMP trap supported version. Possible versions are: <ul style="list-style-type: none"> ■ SNMP v1: Set SNMP trap supported version 1. ■ SNMP v2c: Set SNMP trap supported version 2c. ■ SNMP v3: Set SNMP trap supported version 3.
• Trap Community	Indicates the community access string when send SNMP trap packet. The allowed string length is 0 to 255, and the allowed content is the ASCII characters from 33 to 126.
• Trap Destination Address	Indicates the SNMP trap destination address.
• Trap Destination Port	Indicates the SNMP trap destination port. SNMP Agent will send SNMP message via this port, the port range is 1~65535.
• Trap Inform Mode	Indicates the SNMP trap inform mode operation. Possible modes are: <ul style="list-style-type: none"> ■ Enabled: Enable SNMP trap authentication failure. ■ Disabled: Disable SNMP trap authentication failure.
• Trap Inform Timeout (seconds)	Indicates the SNMP trap inform timeout. The allowed range is 0 to 2147 .
• Trap Inform Retry Times	Indicates the SNMP trap inform retry times. The allowed range is 0 to 255 .
• Trap Probe Security Engine ID	Indicates the SNMPv3 trap probe security engine ID mode of operation. Possible values are: <ul style="list-style-type: none"> ■ Enabled: Enable SNMP trap probe security engine ID mode of operation. ■ Disabled: Disable SNMP trap probe security engine ID mode of operation.
• Trap Security Engine ID	Indicates the SNMP trap security engine ID. SNMPv3 sends traps and informs using USM for authentication and privacy. A unique engine ID for these traps and informs is needed. When "Trap Probe Security Engine ID" is enabled, the ID will be probed automatically. Otherwise, the ID specified in this field is used. The string must contain an even number(in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed.
• Trap Security Name	Indicates the SNMP trap security name. SNMPv3 traps and informs using USM for authentication and privacy. A unique security name is needed when traps and informs are enabled.

<ul style="list-style-type: none"> • System 	Enable/disable that the Interface group's traps. Possible traps are: <ul style="list-style-type: none"> ■ Warm Start: Enable/disable Warm Start trap. ■ Cold Start: Enable/disable Cold Start trap.
<ul style="list-style-type: none"> • Interface 	Indicates that the Interface group's traps. Possible traps are: <ul style="list-style-type: none"> ■ Link Up: Enable/disable Link up trap. ■ Link Down: Enable/disable Link down trap. ■ LLDP: Enable/disable LLDP trap.
<ul style="list-style-type: none"> • AAA 	Indicates that the AAA group's traps. Possible traps are: <ul style="list-style-type: none"> ■ Authentication Fail: Enable/disable SNMP trap authentication failure trap.
<ul style="list-style-type: none"> • Switch 	Indicates that the Switch group's traps. Possible traps are: <ul style="list-style-type: none"> ■ STP: Enable/disable STP trap. ■ RMON: Enable/disable RMON trap.

4.2.2.5 Source

This page provides SNMP trap source configurations. A trap is sent for the given trap source if at least one filter with filter type included matches the filter, and no filters with filter type excluded matches.

Figure 4-2-2-5-1: SNMP Trap Source Configuration Page Screenshot

Click **"Add New Entry"** to add a new entry. The maximum entry count is 32.

Trap Configuration

Trap Source Configurations

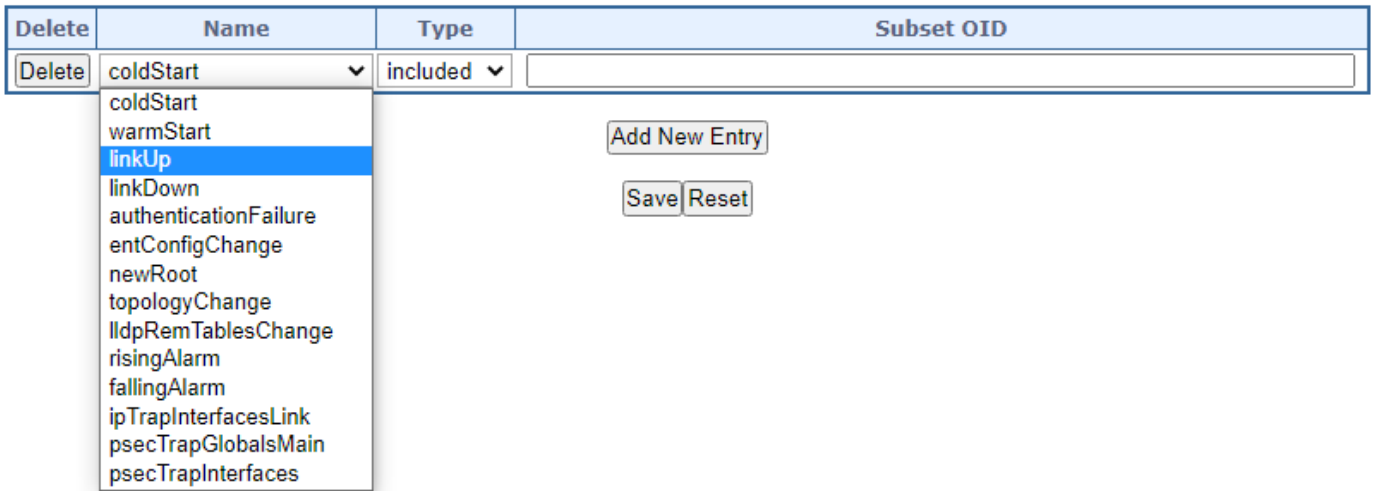

Figure 4-2-2-5-2: SNMP Trap Source Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Name 	Indicates the name for the entry.
<ul style="list-style-type: none"> Type 	<p>The filter type for the entry. Possible types are:</p> <ul style="list-style-type: none"> <input type="checkbox"/> included: An optional flag to indicate a trap is sent for the given trap source is matched. <input type="checkbox"/> excluded: An optional flag to indicate a trap is not sent for the given trap source is matched.
<ul style="list-style-type: none"> Subset OID 	<p>The subset OID for the entry.</p> <p>The value should depend on the what kind of trap name.</p> <p>For example, the ifldex is the subset OID of linkUp and linkDown. A valid subset OID is one or more digital number(0-4294967295) or asterisk(*) which are separated by dots(.). The first character must not begin with asterisk(*) and the maximum of OID count must not exceed 128.</p>

Buttons

- Add New Entry**: Click to add a new community entry. The maximum entry count is 32
- Apply**: Click to apply changes
- Reset**: Click to undo any changes made locally and revert to previously saved values.

4.2.2.6 SNMPv3 Communities

Configure SNMPv3 communities table on this page. The entry index key is Community. The SNMPv3 Communities screen in Figure 4-2-2-5 appears.

Figure 4-2-2-6: SNMPv3 Communities Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Community	Indicates the community access string to permit access to SNMPv3 agent. The allowed string length is 1 to 32, and the allowed content is ASCII characters from 33 to 126. The community string will be treated as security name and map a SNMPv1 or SNMPv2c community string.
• Source IP	Indicates the SNMP access source address. A particular range of source addresses can be used to restrict source subnet when combined with source mask.
• Source Mask	Indicates the SNMP access source address mask.

Buttons

Add New Entry: Click to add a new community entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.7 SNMPv3 Users

Configure SNMPv3 users table on this page. The entry index keys are Engine ID and User Name. The SNMPv3 Users screen in [Figure 4-2-2-7](#) appears.

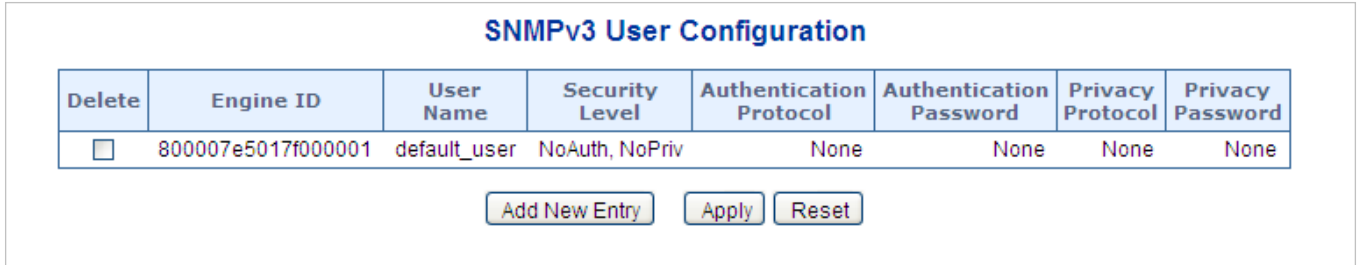

Figure 4-2-2-7: SNMPv3 Users Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • Engine ID 	<p>An octet string identifying the engine ID that this entry should belong to. The string must contain an even number (in hexadecimal format) with number of digits between 10 and 64, but all-zeros and all-'F's are not allowed. The SNMPv3 architecture uses the User-based Security Model (USM) for message security and the View-based Access Control Model (VACM) for access control. For the USM entry, the usmUserEngineID and usmUserName are the entry's keys.</p> <p>In a simple agent, usmUserEngineID is always that agent's own snmpEngineID value. The value can also take the value of the snmpEngineID of a remote SNMP engine with which this user can communicate. In other words, if user engine ID equal system engine ID then it is local user; otherwise it's remote user.</p>
<ul style="list-style-type: none"> • User Name 	A string identifying the user name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is ASCII characters from 33 to 126.
<ul style="list-style-type: none"> • Security Level 	<p>Indicates the security model that this entry should belong to. Possible security models are:</p> <ul style="list-style-type: none"> ■ NoAuth, NoPriv: None authentication and none privacy. ■ Auth, NoPriv: Authentication and none privacy. ■ Auth, Priv: Authentication and privacy. <p>The value of security level cannot be modified if entry already exist. That means must first ensure that the value is set correctly.</p>

<ul style="list-style-type: none"> • Authentication Protocol 	<p>Indicates the authentication protocol that this entry should belong to. Possible authentication protocol are:</p> <ul style="list-style-type: none"> ■ None: None authentication protocol. ■ MD5: An optional flag to indicate that this user using MD5 authentication protocol. ■ SHA: An optional flag to indicate that this user using SHA authentication protocol. <p>The value of security level cannot be modified if entry already exist. That means must first ensure that the value is set correctly.</p>
<ul style="list-style-type: none"> • Authentication Password 	<p>A string identifying the authentication pass phrase. For MD5 authentication protocol, the allowed string length is 8 to 32. For SHA authentication protocol, the allowed string length is 8 to 40. The allowed content is the ASCII characters from 33 to 126.</p>
<ul style="list-style-type: none"> • Privacy Protocol 	<p>Indicates the privacy protocol that this entry should belong to. Possible privacy protocol are:</p> <ul style="list-style-type: none"> ■ None: None privacy protocol. ■ DES: An optional flag to indicate that this user using DES authentication protocol. ■ AES: An optional flag to indicate that this user uses AES authentication protocol.
<ul style="list-style-type: none"> • Privacy Password 	<p>A string identifying the privacy pass phrase. The allowed string length is 8 to 32, and the allowed content is the ASCII characters from 33 to 126.</p>

Buttons

: Click to add a new user entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.2.8 SNMPv3 Groups

Configure SNMPv3 groups table on this page. The entry index keys are Security Model and Security Name. The SNMPv3 Groups screen in [Figure 4-2-2-8](#) appears.

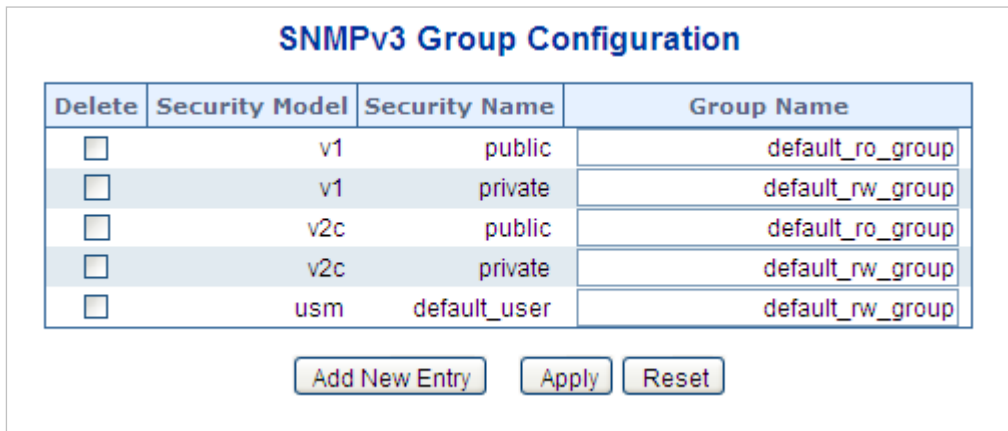

Figure 4-2-2-8: SNMPv3 Groups Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • Security Model 	Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"> ■ v1: Reserved for SNMPv1. ■ v2c: Reserved for SNMPv2c. ■ usm: User-based Security Model (USM).
<ul style="list-style-type: none"> • Security Name 	A string identifying the security name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
<ul style="list-style-type: none"> • Group Name 	A string identifying the group name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.

Buttons

: Click to add a new group entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.2.9 SNMPv3 Views

Configure SNMPv3 views table on this page. The entry index keys are View Name and OID Subtree. The SNMPv3 Views screen in [Figure 4-2-2-9](#) appears.

Figure 4-2-2-9: SNMPv3 Views Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • View Name 	A string identifying the view name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
<ul style="list-style-type: none"> • View Type 	<p>Indicates the view type that this entry should belong to. Possible view type are:</p> <ul style="list-style-type: none"> ■ included: An optional flag to indicate that this view subtree should be included. ■ excluded: An optional flag to indicate that this view subtree should be excluded. <p>In general, if a view entry's view type is 'excluded', it should be exist another view entry which view type is 'included' and it's OID subtree overstep the 'excluded' view entry.</p>
<ul style="list-style-type: none"> • OID Subtree 	The OID defining the root of the subtree to add to the named view. The allowed OID length is 1 to 128. The allowed string content is digital number or asterisk(*)

Buttons

Add New Entry: Click to add a new view entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.2.10 SNMPv3 Access

Configure SNMPv3 accesses table on this page. The entry index keys are Group Name, Security Model and Security Level. The SNMPv3 Access screen in [Figure 4-2-2-10](#) appears.

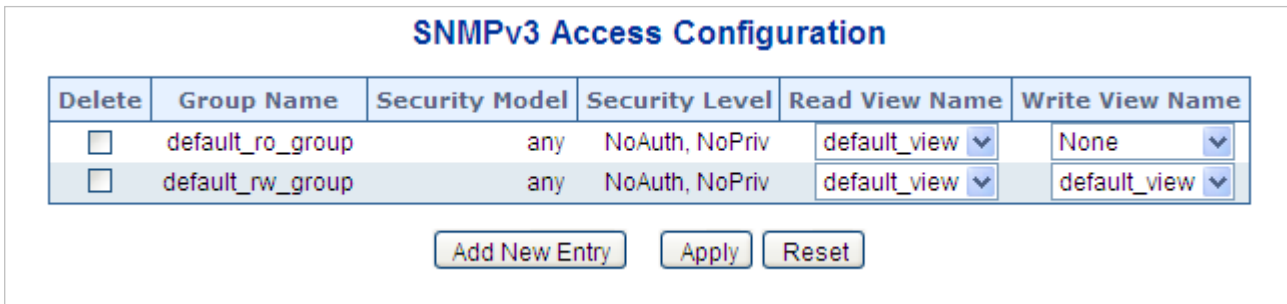

Figure 4-2-2-10: SNMPv3 Accesses Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Group Name	A string identifying the group name that this entry should belong to. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
• Security Model	Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"> ■ any: Accepted any security model (v1 v2c usm). ■ v1: Reserved for SNMPv1. ■ v2c: Reserved for SNMPv2c. ■ usm: User-based Security Model (USM)
• Security Level	Indicates the security model that this entry should belong to. Possible security models are: <ul style="list-style-type: none"> ■ NoAuth, NoPriv: None authentication and none privacy. ■ Auth, NoPriv: Authentication and none privacy. ■ Auth, Priv: Authentication and privacy.
• Read View Name	The name of the MIB view defining the MIB objects for which this request may request the current values. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.
• Write View Name	The name of the MIB view defining the MIB objects for which this request may potentially SET new values. The allowed string length is 1 to 32, and the allowed content is the ASCII characters from 33 to 126.

Buttons

Add New Entry: Click to add a new access entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.3 RMON

RMON is the most important expansion of the standard SNMP. RMON is a set of MIB definitions, used to define standard network monitor functions and interfaces, enabling the communication between SNMP management terminals and remote monitors. RMON provides a highly efficient method to monitor actions inside the subnets.

MID of RMON consists of 10 groups. The switch supports the most frequently used groups 1, 2, 3 and 9:

- **Statistics:** Maintain basic usage and error statistics for each subnet monitored by the agent.
- **History:** Record periodical statistic samples available from statistics.
- **Alarm:** Allow management console users to set any count or integer for sample intervals and alert thresholds for RMON agent records.
- **Event:** A list of all events generated by RMON agent.

Alarm depends on the implementation of Event. Statistics and History display some current or history subnet statistics. Alarm and Event provide a method to monitor any integer data change in the network, and provide some alerts upon abnormal events (sending Trap or record in logs).

4.2.3.1 RMON Alarm Configuration

Configure RMON Alarm table on this page. The entry index key is **ID**; screen in [Figure 4-2-3-1](#) appears.

Figure 4-2-3-1: RMON Alarm Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• ID	Indicates the index of the entry. The range is from 1 to 65535.
• Interval	Indicates the interval in seconds for sampling and comparing the rising and falling threshold. The range is from 1 to 2 ³¹ -1.

<ul style="list-style-type: none"> • Variable 	<p>Indicates the particular variable to be sampled; the possible variables are:</p> <ul style="list-style-type: none"> ■ InOctets: The total number of octets received on the interface, including framing characters. ■ InUcastPkts: The number of uni-cast packets delivered to a higher-layer protocol. ■ InNUcastPkts: The number of broadcast and multi-cast packets delivered to a higher-layer protocol. ■ InDiscards: The number of inbound packets that are discarded even the packets are normal. ■ InErrors: The number of inbound packets that contains errors preventing them from being deliverable to a higher-layer protocol. ■ InUnknownProtos: the number of the inbound packets that is discarded because of the unknown or un-support protocol. ■ OutOctets: The number of octets transmitted out of the interface, including framing characters. ■ OutUcastPkts: The number of uni-cast packets that requests to transmit. ■ OutNUcastPkts: The number of broadcast and multi-cast packets that requests to transmit. ■ OutDiscards: The number of outbound packets that is discarded even the packets are normal. ■ OutErrors: The number of outbound packets that could not be transmitted because of errors. ■ OutQLen: The length of the output packet queue (in packets).
<ul style="list-style-type: none"> • Sample Type 	<p>The method of sampling the selected variable and calculating the value to be compared against the thresholds; possible sample types are:</p> <ul style="list-style-type: none"> ■ Absolute: Get the sample directly. ■ Delta: Calculate the difference between samples (default).
<ul style="list-style-type: none"> • Value 	<p>The value of the statistic during the last sampling period.</p>
<ul style="list-style-type: none"> • Startup Alarm 	<p>The method of sampling the selected variable and calculating the value to be compared against the thresholds; possible sample types are:</p> <ul style="list-style-type: none"> ■ RisingTrigger alarm when the first value is larger than the rising threshold. ■ FallingTrigger alarm when the first value is less than the falling threshold. ■ RisingOrFallingTrigger alarm when the first value is larger than the rising threshold or less than the falling threshold (default).
<ul style="list-style-type: none"> • Rising Threshold 	<p>Rising threshold value (-2147483648-2147483647).</p>
<ul style="list-style-type: none"> • Rising Index 	<p>Rising event index (1-65535).</p>
<ul style="list-style-type: none"> • Falling Threshold 	<p>Falling threshold value (-2147483648-2147483647)</p>
<ul style="list-style-type: none"> • Falling Index 	<p>Falling event index (1-65535).</p>

Buttons

 : Click to add a new community entry.

 : Click to apply changes

 : Click to undo any changes made locally and revert to previously saved values.

4.2.3.2 RMON Alarm Status

This page provides an overview of RMON Alarm entries. Each page shows up to 99 entries from the Alarm table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Alarm table. The first displayed will be the one with the lowest ID found in the Alarm table; screen in [Figure 4-2-3-2](#) appears.

Figure 4-2-3-2: RMON Alarm Overview Page Screenshot

The page includes the following fields:

Object	Description
• ID	Indicates the index of Alarm control entry.
• Interval	Indicates the interval in seconds for sampling and comparing the rising and falling threshold.
• Variable	Indicates the particular variable to be sampled.
• Sample Type	The method of sampling the selected variable and calculating the value to be compared against the thresholds.
• Value	The value of the statistic during the last sampling period.
• Startup Alarm	The alarm that may be sent when this entry is first set to valid.
• Rising Threshold	Rising threshold value
• Rising Index	Rising event index
• Falling Threshold	Falling threshold value
• Falling Index	Falling event index

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table, starting from the first entry in the Alarm Table, i.e. the entry with the lowest ID.

: Updates the table, starting with the entry after the last entry currently displayed.

4.2.3.3 RMON Event Configuration

Configure RMON Event table on this page. The entry index key is **ID**; screen in [Figure 4-2-3-3](#) appears.

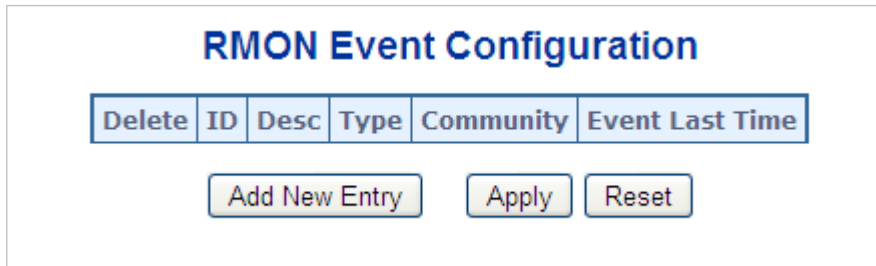

Figure 4-2-3-3 RMON Event Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• ID	Indicates the index of the entry. The range is from 1 to 65535.
• Desc	Indicates this event, the string length is from 0 to 127, default is a null string.
• Type	Indicates the notification of the event; the possible types are: <ul style="list-style-type: none"> ■ none: The total number of octets received on the interface, including framing characters. ■ log: The number of uni-cast packets delivered to a higher-layer protocol. ■ snmptrap: The number of broad-cast and multi-cast packets delivered to a higher-layer protocol. ■ logandtrap: The number of inbound packets that are discarded even the packets are normal.
• Community	Specify the community when trap is sent, the string length is from 0 to 127, default is "public".
• Event Last Time	Indicates the value of sysUpTime at the time this event entry last generated an event.

Buttons

: Click to add a new community entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.3.4 RMON Event Status

This page provides an overview of RMON Event table entries. Each page shows up to 99 entries from the Event table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Event table. The first displayed will be the one with the lowest Event Index and Log Index found in the Event table; screen in [Figure 4-2-3-4](#) appears.

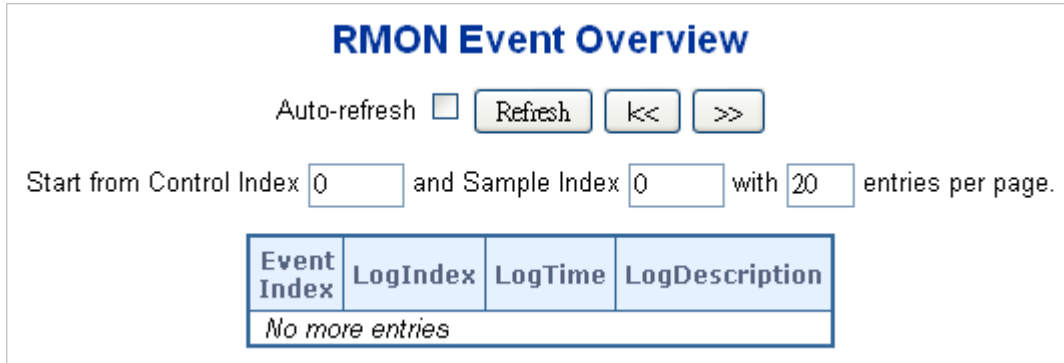

Figure 4-2-3-4: RMON Event Overview Page Screenshot

The page includes the following fields:

Object	Description
• Event Index	Indicates the index of the event entry.
• Log Index	Indicates the index of the log entry.
• Logtime	Indicates Event log time.
• Log Description	Indicates the Event description.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table starting from the first entry in the Alarm Table, i.e. the entry with the lowest ID.

: Updates the table, starting with the entry after the last entry currently displayed.

: Updates the table, starting with the entry after the last entry currently displayed.

4.2.3.5 RMON History Configuration

Configure RMON History table on this page. The entry index key is **ID**; screen in [Figure 4-2-3-5](#) appears.

Figure 4-2-3-5: RMON History Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• ID	Indicates the index of the entry. The range is from 1 to 65535.
• Data Source	Indicates the port ID which wants to be monitored.
• Interval	Indicates the interval in seconds for sampling the history statistics data. The range is from 1 to 3600, default value is 1800 seconds.
• Buckets	Indicates the maximum data entries associated this History control entry stored in RMON. The range is from 1 to 3600, default value is 50.
• Buckets Granted	The number of data will be saved in the RMON.

Buttons

Add New Entry: Click to add a new community entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.3.6 RMON Statistics Configuration

Configure RMON Statistics table on this page. The entry index key is **ID**; screen in [Figure 4-2-3-6](#) appears.

Figure 4-2-3-6: RMON Statistics Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• ID	Indicates the index of the entry. The range is from 1 to 65535.
• Data Source	Indicates the port ID which wants to be monitored.

Buttons

Add New Entry: Click to add a new community entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.3.7 RMON Statistics Status

This page provides an overview of RMON Statistics entries. Each page shows up to 99 entries from the Statistics table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Statistics table. The first displayed will be the one with the lowest ID found in the Statistics table; screen in below appears.

RMON Statistics Status Overview

Auto-refresh Refresh << >>

Start from Control Index with entries per page.

ID	Data Source (ifIndex)	Drop	Octets	Pkts	Broad-cast	Multi-cast	CRC Errors	Under-size	Over-size	Frag.	Jabb.	Coll.	64 Bytes	65 ~ 127	128 ~ 255	256 ~ 511	512 ~ 1023	1024 ~ 1588
No more entries																		

Figure: RMON Statistics Status Overview Page Screenshot

The page includes the following fields:

Object	Description
• ID	Indicates the index of Statistics entry.
• Data Source (ifIndex)	The port ID which wants to be monitored.
• Drop	The total number of events in which packets were dropped by the probe due to lack of resources.
• Octets	The total number of octets of data (including those in bad packets) received on the network.
• Pkts	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.
• Broadcast	The total number of good packets received that were directed to the broadcast address.
• Multicast	The total number of good packets received that were directed to a multicast address.
• CRC Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets.
• Undersize	The total number of packets received that were less than 64 octets.
• Oversize	The total number of packets received that were longer than 1518 octets.
• Frag.	The number of frames whose size is less than 64 octets received with invalid CRC.
• Jabb.	The number of frames whose size is larger than 64 octets received with invalid CRC.
• Coll.	The best estimate of the total number of collisions in this Ethernet segment.

<ul style="list-style-type: none"> • 64 Bytes 	The total number of packets (including bad packets) received that were 64 octets in length.
<ul style="list-style-type: none"> • 65~127 	The total number of packets (including bad packets) received that were between 65 to 127 octets in length.
<ul style="list-style-type: none"> • 128~255 	The total number of packets (including bad packets) received that were between 128 to 255 octets in length.
<ul style="list-style-type: none"> • 256~511 	The total number of packets (including bad packets) received that were between 256 to 511 octets in length.
<ul style="list-style-type: none"> • 512~1023 	The total number of packets (including bad packets) received that were between 512 to 1023 octets in length.
<ul style="list-style-type: none"> • 1024~1518 	The total number of packets (including bad packets) received that were between 1024 to 1518 octets in length.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table, starting from the first entry in the Alarm Table, i.e. the entry with the lowest ID.

: Updates the table, starting with the entry after the last entry currently displayed.

4.2.4 DHCP Relay

4.2.4.1 DHCPv4 Relay

Configure DHCP Relay on this page. **DHCP Relay** is used to forward and transfer DHCP messages between the clients and the server when they are not on the same subnet domain.

The **DHCP option 82** enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options:

- **Circuit ID (option 1)**
- **Remote ID (option 2)**

The **Circuit ID** sub-option is supposed to include information specific to which circuit the request came in on.

The **Remote ID** sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes representing the VLAN ID. The parameter of "module_id" is the third byte for the module ID. The parameter of "port_no" is the fourth byte and it means the port number.

The Remote ID is 6 bytes in length, and the value equals the DHCP relay agent's MAC address. The DHCP Relay Configuration screen in [Figure 4-2-4-1](#) appears.

DHCP Relay Configuration

Relay Mode	Disabled
Relay Server	0.0.0.0
Relay Information Mode	Disabled
Relay Information Policy	Keep

Figure 4-2-4-1 DHCP Relay Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Relay Mode 	<p>Indicates the DHCP relay mode operation. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable DHCP relay mode operation. When enabling DHCP relay mode operation, the agent forwards and transfers DHCP messages between the clients and the server when they are not on the same subnet domain. And the DHCP broadcast message won't flood for security considered. ■ Disabled: Disable DHCP relay mode operation.
<ul style="list-style-type: none"> • Relay Server 	<p>Indicates the DHCP relay server IP address. A DHCP relay agent is used to forward and transfer DHCP messages between the clients and the server when they are not on the same subnet domain.</p>
<ul style="list-style-type: none"> • Relay Information Mode 	<p>Indicates the DHCP relay information mode option operation. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable DHCP relay information mode operation. When enabling DHCP relay information mode operation, the agent inserts specific information (option82) into a DHCP message when forwarding to DHCP server and removing it from a DHCP message when transferring to DHCP client. It only works under DHCP relay operation mode enabled. ■ Disabled: Disable DHCP relay information mode operation.
<ul style="list-style-type: none"> • Relay Information Policy 	<p>Indicates the DHCP relay information option policy. When enabling DHCP relay information mode operation, if agent receives a DHCP message that already contains relay agent information. It will enforce the policy. And it only works under DHCP relay information operation mode enabled. Possible policies are:</p> <ul style="list-style-type: none"> ■ Replace: Replace the original relay information when receiving a DHCP message that already contains it. ■ Keep: Keep the original relay information when receiving a DHCP message that already contains it. ■ Drop: Drop the package when receiving a DHCP message that already contains relay information.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.4.2 DHCPv4 Relay Statistics

This page provides statistics for DHCP relay. The DHCP Relay Statistics screen in [Figure 4-2-4-2](#) appears.

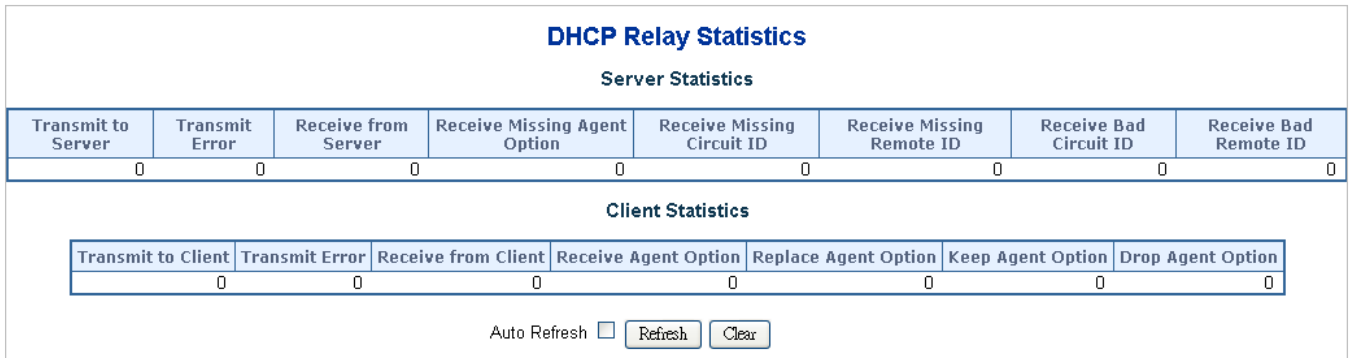

Figure 4-2-4-2: DHCP Relay Statistics Page Screenshot

The page includes the following fields:

Server Statistics

Object	Description
• Transmit to Server	The packet number that relayed from client to server.
• Transmit Error	The packet number that erroneously sent packets to clients.
• Receive from Server	The packet number that received packets from server.
• Receive Missing Agent Option	The packet number that received packets without agent information options.
• Receive Missing Circuit ID	The packet number that received packets whose the Circuit ID option was missing.
• Receive Missing Remote ID	The packet number that received packets whose Remote ID option was missing.
• Receive Bad Circuit ID	The packet number whose the Circuit ID option did not match the known circuit ID.
• Receive Bad Remote ID	The packet number whose the Remote ID option did not match the known Remote ID.

Client Statistics

Object	Description
• Transmit to Client	The packet number that relayed packets from server to client.
• Transmit Error	The packet number that erroneously sent packets to servers.
• Receive from Client	The packet number that received packets from server.
• Receive Agent Option	The packet number that received packets with relay agent information option.
• Replace Agent Option	The packet number that replaced received packets with relay agent information option.
• Keep Agent Option	The packet number that kept received packets with relay agent information option.
• Drop Agent Option	The packet number that dropped received packets with relay agent information option.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

: Clears all statistics.

4.2.4.3 DHCPv6 Relay

This is a table to configure Dhcp6_Relay for a specific vlan.

The displayed settings are:

DHCPv6 Relay Configuration

Delete	Interface	Relay Interface	Relay Destination
No entry exists			

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Default	Interface identification. The id of the interface used for relaying.
• Relay Destination	An Ipv6 address represented as human readable text as specified in RFC5952. The IPv6 address of the DHCPv6 server that requests shall be relayed to. The default value 'ff05::1:3' means 'any DHCP server'.

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.4.4 DHCPv6 Relay Statistics

Shows current, configured relay agents and their statistics.

DHCPv6 Relay Status and Statistics

Auto-refresh

Dropped server packets with interface option missing: 0

Interface	Relay Interface	Relay Address	Tx to server	Rx from server	Server pkts dropped	Tx to client	Rx from client	Client pkts dropped	Clear stats
No entry exists									

The displayed settings are:

Object	Description
• Interface	Interface identification. The id of the interface that receives client requests.
• Relay Interface	Interface identification. The id of the interface used for relaying.
• Relay Address	An Ipv6 address represented as human readable text as specified in RFC5952. The IPv6 address that requests shall be relayed to. The default value 'ff05::1:3' means 'any DHCPv6 server'.
• Tx to server	Integer number. Number of packets received from server.
• Rx from server	Integer number. Number of packets received from server.
• Server pkts dropped	Integer number. Number of packets from server that relay agent drops.
• Tx to client	Integer number. Number of packets sent to client.
• Rx from client	Integer number. Number of packets received from client.
• Client pkts dropped	Integer number. Number of packets from client that relay agent drops.
• Clear stats	Resets all statistics counters of relevant entry to zero.

Buttons

: Resets all statistics counters to zero.

: Click to apply changes

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.2.5 DHCP server

4.2.5.1 Mode

Configure DHCP server mode on this page. The entry index key is **ID.**; screen in [Figure 4-2-5-1](#) appears.

Figure 4-2-5-1: DHCP server mode Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Configure the operation mode per system. Possible modes are:</p> <p>Enabled: Enable DHCP server per system.</p> <p>Disabled: Disable DHCP server per system.</p>
<ul style="list-style-type: none"> • VLAN Mode 	<p>Configure operation mode to enable/disable DHCP server per VLAN.</p>
<ul style="list-style-type: none"> • VLAN Range 	<p>Indicate the VLAN range in which DHCP server is enabled or disabled. The first VLAN ID must be smaller than or equal to the second VLAN ID. BUT, if the VLAN range contains only 1 VLAN ID, then you can just input it into either one of the first and second VLAN ID or both.</p> <p>On the other hand, if you want to disable existed VLAN range, then you can follow the steps.</p> <ol style="list-style-type: none"> 1. press to add a new VLAN range. 2. input the VLAN range that you want to disable. 3. choose Mode to be Disabled. 4. press to apply the change. <p>Then, you will see the disabled VLAN range is removed from the DHCP Server mode configuration page.</p>
<ul style="list-style-type: none"> • Mode 	<p>■ Indicate the operation mode per VLAN. Possible modes are:</p> <p>Enabled: Enable DHCP server per VLAN.</p> <p>Disabled: Disable DHCP server per VLAN.</p>

Buttons

Add VLAN Range: Click to add a new VLAN range.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.5.2 Excluded IP

Configure DHCP server mode on this page. The entry index key is **ID.**; screen in [Figure 4-2-5-2](#) appears.

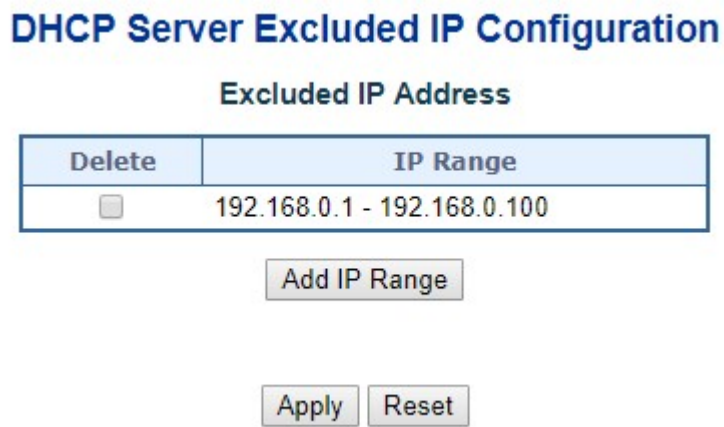

Figure 4-2-5-2: DHCP server excluded Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> IP range 	Define the IP range to be excluded IP addresses. The first excluded IP must be smaller than or equal to the second excluded IP. BUT, if the IP range contains only 1 excluded IP, then you can just input it to either one of the first and second excluded IP or both.

Buttons

Add IP Range: Click to add a new excluded IP range.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.2.5.3 Pool

This page manages DHCP pools. According to the DHCP pool, DHCP server will allocate IP address and deliver configuration parameters to DHCP client. screen in [Figure 4-2-5-3](#) appears.

DHCP Server Pool Configuration

Pool Setting

Delete	Name	Type	IP	Subnet Mask	Lease Time
<input type="checkbox"/>	vlan1	Network	192.168.0.100	255.255.255.0	3 days 0 hours 0 minutes

Figure 4-2-5-3: DHCP server pool Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Name 	Configure the pool name that accepts all printable characters, except white space. If you want to configure the detail settings, you can click the pool name to go into the configuration page.
<ul style="list-style-type: none"> Type 	Display which type of the pool is. Network: the pool defines a pool of IP addresses to service more than one DHCP client. Host: the pool services for a specific DHCP client identified by client identifier or hardware address.
<ul style="list-style-type: none"> IP 	Display network number of the DHCP address pool. If "-" is displayed, it means not defined
<ul style="list-style-type: none"> Subnet Mask 	Display subnet mask of the DHCP address pool. If "-" is displayed, it means not defined.
<ul style="list-style-type: none"> Lease Time 	Display lease time of the pool.

Buttons

- : Click to add a new excluded IP range.
- : Click to apply changes
- : Click to undo any changes made locally and revert to previously saved values.

4.2.5.4 Statistics

This page displays the database counters and the number of DHCP messages sent and received by DHCP server.. screen in [Figure 4-2-5-4](#) appears.

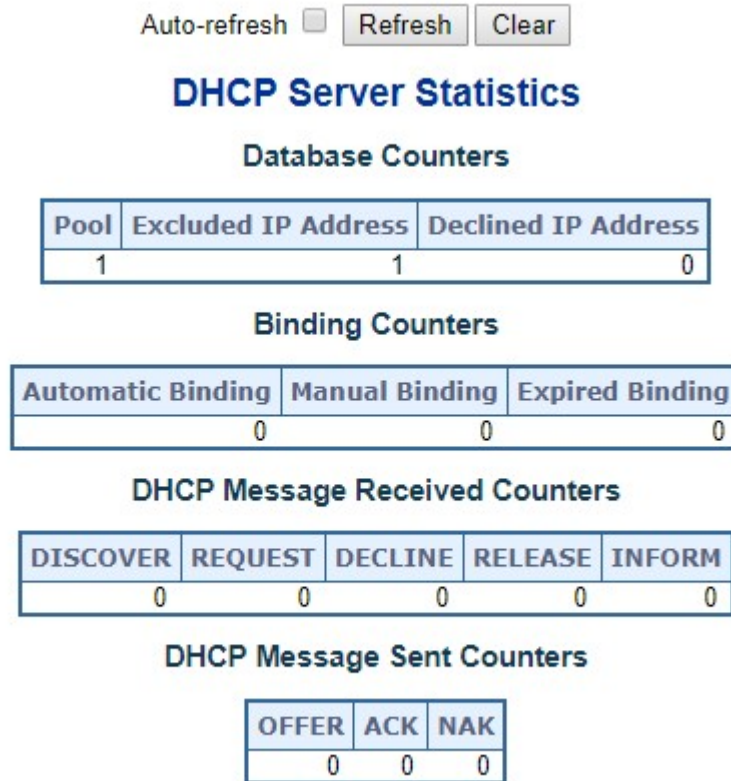

Figure 4-2-5-4: DHCP server Statistics Page Screenshot

The page includes the following fields:

Database Counters

Object	Description
• Pool	Number of pools
• Excluded IP Address	Number of excluded IP address ranges
• Declined IP Address	Number of declined IP addresses.

Binding Counters

Object	Description
• Automatic Binding	Number of bindings with network-type pools
• Manual Binding	Number of bindings that administrator assigns an IP address to a client. That is, the pool is of host type.
• Expired Binding	Number of bindings that their lease time expired or they are cleared from Automatic/Manual type bindings.

DHCP message Received Counters

Object	Description
• Discover	Number of DHCP DISCOVER messages received.
• Request	Number of DHCP REQUEST messages received.
• Decline	Number of DHCP DECLINE messages received.
• Release	Number of DHCP RELEASE messages received.
• Inform	Number of DHCP INFORM messages received.

DHCP message Sent Counters

Object	Description
• Offer	Number of DHCP OFFER messages sent.
• ACK	Number of DHCP ACK messages sent.
• NAK	Number of DHCP NAK messages sent.

Buttons

Auto-refresh seconds. : Check this box to refresh the page automatically. Automatic refresh occurs every ?

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.2.5.5 Binding

This page displays bindings generated for DHCP clients. screen in [Figure 4-2-5-5](#) appears.

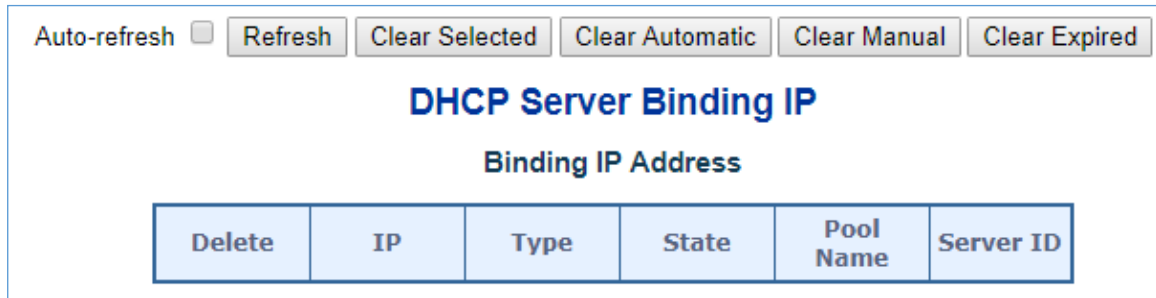

Figure 4-2-5-5: DHCP server Binding IP page Screenshot

The page includes the following fields:

Object	Description
• IP	Display IP address allocated to DHCP client.
• Type	Display type of binding. Possible types are Automatic, Manual, Expired.
• State	Display state of binding. Possible states are Committed, Allocated, Expired
• Pool Name	Display the pool that generates the binding.
• Server ID	Display server IP address to service the binding.

Buttons

Auto-refresh : Check this box to refresh the page automatically

Refresh : Click to refresh the page immediately.

Clear Selected : Click to clear selected bindings. If the selected binding is Automatic or Manual, then it is changed to be Expired. If the selected binding is Expired, then it is freed.

Clear Automatic : Click to clear all Automatic bindings and Change them to Expired bindings.

Clear Manual : Click to clear all Manual bindings and Change them to Expired bindings.

Clear Expired : Click to clear all Expired bindings and free them.

4.2.5.6 Declined IP

This page displays declined IP addresses. screen in [Figure 4-2-5-6](#) appears.

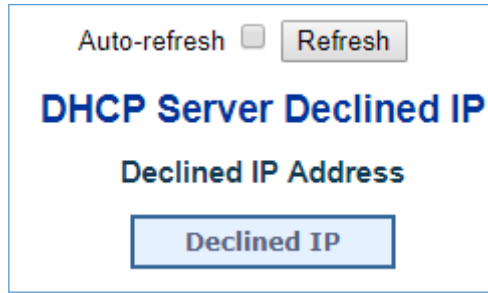

Figure 4-2-5-6: DHCP server Declined IP Page Screenshot

The page includes the following fields:

Object	Description
• Delined IP	Display List of IP addresses declined.

Buttons

Auto-refresh : Check this box to refresh the page automatically

Refresh : Click to refresh the page immediately.

4.2.6 Remote Management

The Industrial Managed PoE+ Switch can support both NMS controller and CloudViewer Sever for remote management. PLANET's **NMS Controller** is a Network Management System can monitor all kinds of deployed network devices, such as Industrial Managed PoE+ Switches, media converters, routers, smart APs, VoIP phones, IP cameras, etc., compliant with the SNMP Protocol, ONVIF Protocol and PLANET Smart Discovery utility. The **CloudViewer** is a free networking service just for PLANET Products. This service provides simplified network monitoring and real-time network status. Working with PLANET CloudViewer app, user can easily check network status, device information, Port and PoE status from Internet. Any other services are not included.

4.2.6.1 Remote NMS Configuration

The Remote NMS Configuration screens in [Figure 4-2-6-1](#) appear.

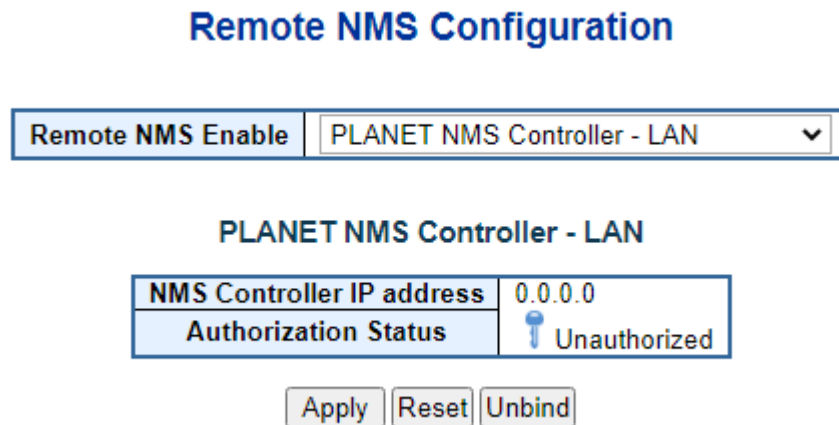

Figure 4-2-6-1: Remote NMS Configuration Page Screenshot

The PLANET NMS Controller – LAN Configuration screens in [Figure 4-2-6-2](#) appear.

Figure 4-2-6-2: PLANET NMS Controller – LAN Configuration Page Screenshot

Object	Description
• Remote NMS Enable	Enable NMS management.
• NMS Controller IP address	The IP address of NMS Controller.
• Authorization Status	Indicate the authorization status of the switch to NMS Controller.

The CloudViewer Server – Internet screens in [Figure 4-2-6-3](#) appear.

• Status	Indicate the status of connecting CloudViewer Server.

4.3 Switching

4.3.1 Port Management

Use the Port Menu to display or configure the Managed Switch's ports. This section has the following items:

- **Port Configuration** Configures port connection settings
- **Port Statistics Overview** Lists Ethernet and RMON port statistics
- **Port Statistics Detail** Lists Ethernet and RMON port statistics
- **Port Mirror** Sets the source and target ports for mirroring
- **Name Map** Interface Name to Port Number Map
- **DDMI** Configure DDMI on this page.
- **DDMI Over View** Display DDMI overview information on this page.
- **DDMI Detailed** Display DDMI detailed information on this page.

4.3.1.1 Port Configuration

This page displays current port configurations. Ports can also be configured here. The Port Configuration screen in [Figure 4-3-1-1](#) appears.

Figure 4-3-1-3: Detailed Port Statistics Port 1 Page Screenshot

The page includes the following fields:

Receive Total and Transmit Total

Object	Description
• Rx and Tx Packets	The number of received and transmitted (good and bad) packets
• Rx and Tx Octets	The number of received and transmitted (good and bad) bytes, including FCS, but excluding framing bits.
• Rx and Tx Unicast	The number of received and transmitted (good and bad) unicast packets.
• Rx and Tx Multicast	The number of received and transmitted (good and bad) multicast packets.
• Rx and Tx Broadcast	The number of received and transmitted (good and bad) broadcast packets.
• Rx and Tx Pause	A count of the MAC Control frames received or transmitted on this port that has an opcode indicating a PAUSE operation.

Receive and Transmit Size Counters

The number of received and transmitted (good and bad) packets split into categories based on their respective frame sizes.

Receive and Transmit Queue Counters

The number of received and transmitted packets per input and output queue.

Receive Error Counters

Object	Description
• Rx Drops	The number of frames dropped due to lack of receive buffers or egress congestion.
• Rx CRC/Alignment	The number of frames received with CRC or alignment errors.
• Rx Undersize	The number of short frames received with valid CRC.
• Rx Oversize	The number of long frames received with valid CRC.
• Rx Fragments	The number of short frames received with invalid CRC.
• Rx Jabber	The number of long frames received with invalid CRC.
• Rx Filtered	The number of received frames filtered by the forwarding process.

- 1 Short frames are frames that are smaller than 64 bytes.
 2 Long frames are frames that are longer than the configured maximum frame length for this port.

Transmit Error Counters

Object	Description
• Tx Drops	The number of frames dropped due to output buffer congestion.
• Tx Late/Exc. Coll.	The number of frames dropped due to excessive or late collisions.

Buttons

: Click to refresh the page immediately.

: Clears the counters for all ports.

Auto-refresh Check this box to enable an automatic refresh of the page at regular intervals.

4.3.1.4 Port Mirror

Configure port Mirroring on this page. This function provides monitoring network traffic that forwards a copy of each incoming or outgoing packet from one port of a network Switch to another port where the packet can be studied. It enables the manager to keep close track of switch performance and alter it if necessary.

- To debug network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.
- The Managed Switch can unobtrusively mirror traffic from any port to a monitor port. You can then attach a protocol analyzer or RMON probe to this port to perform traffic analysis and verify connection integrity.

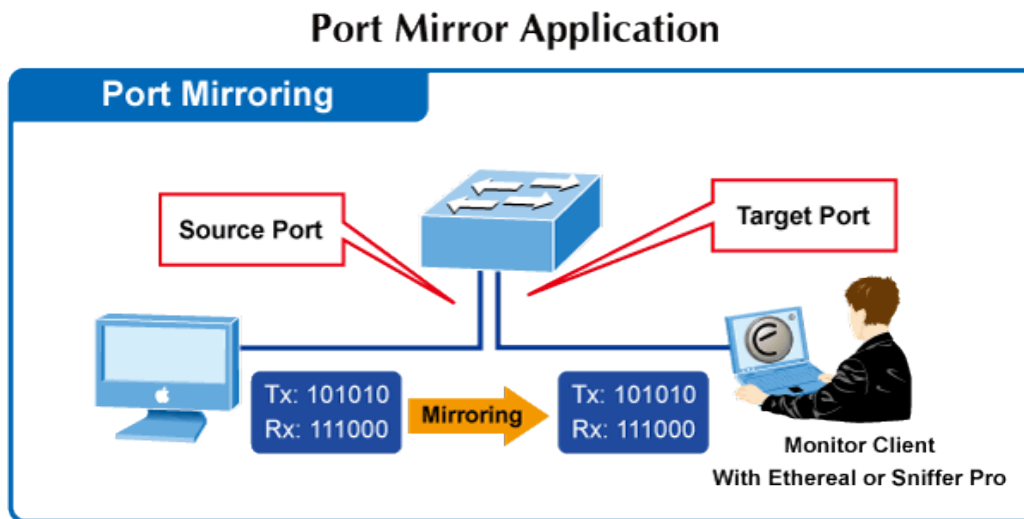

Figure 4-3-1-4-1: Port Mirror Application

The traffic to be copied to the mirror port is selected as follows:

- All frames received on a given port (also known as ingress or source mirroring).
- All frames transmitted on a given port (also known as egress or destination mirroring).

Mirror Port Configuration

The Port Mirror screen in [Figure 4-3-1-4-2](#) appears, and click the session ID to [Figure 4-3-1-4-3](#)

Refresh

Session ID	Mode	Type	VLAN ID	Reflector Port
1	Disabled	Mirror	-	-
2	Disabled	Mirror	-	-
3	Disabled	Mirror	-	-
4	Disabled	Mirror	-	-

Figure 4-3-1-4-2: Mirror Configuration Page Screenshot

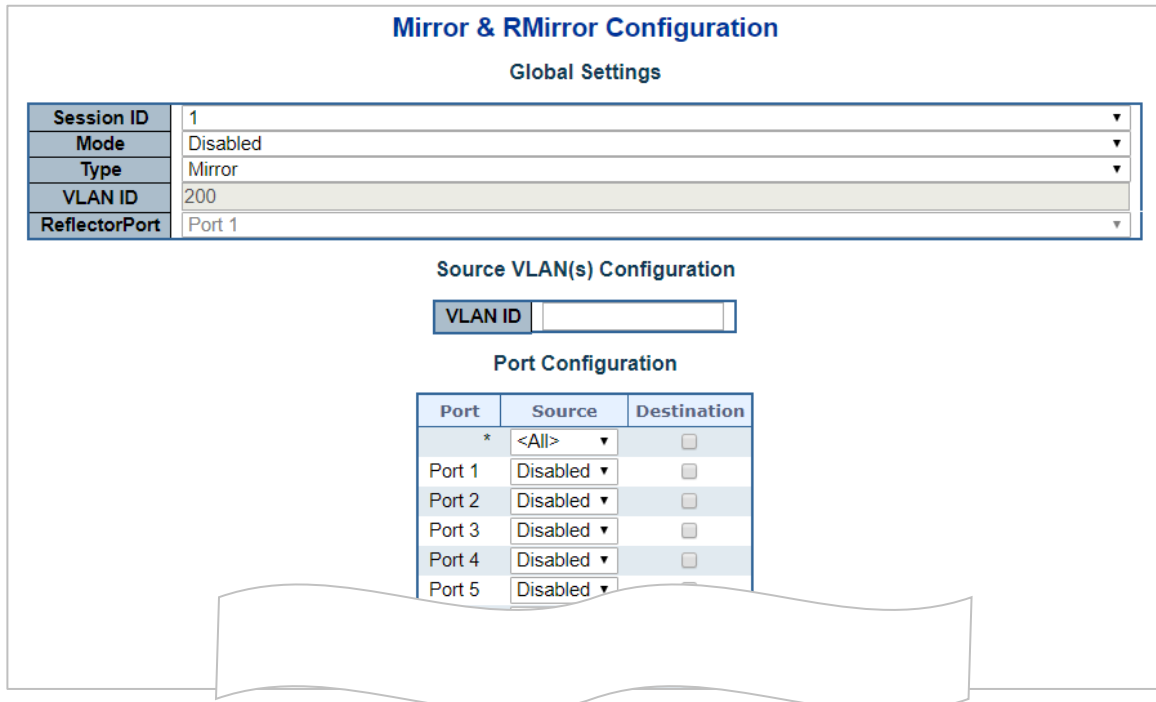

Figure 4-3-1-4-3: Mirror Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Session	Select session id to configure.
• Mode	To Enabled/Disabled the mirror or Remote Mirroring function
• Type	<p>Mirror</p> <p>The switch is running on mirror mode. The source port(s) and destination port are located on this switch.</p> <p>Source</p> <p>The switch is a source node for monitor flow. The source port(s), reflector port are located on this switch.</p> <p>RMirror destination</p> <p>The switch is an end node for monitor flow. The destination port(s) is located on this switch.</p>
• VLAN ID	The VLAN ID points out where the monitor packet will copy to. The default VLAN ID is 200.

<ul style="list-style-type: none"> • Reflector Port 	<p>The reflector port is a method to redirect the traffic to Remote Mirroring VLAN. Any device connected to a port set as a reflector port loses connectivity until the Remote Mirroring is disabled.</p> <p>In the stacking mode, you need to select switch ID to select the correct device.</p> <p>If you shut down a port, it cannot be a candidate for reflector port.</p> <p>If you shut down the port which is a reflector port, the remote mirror function cannot work</p>
<ul style="list-style-type: none"> • Source VLAN(s) Configuration 	<p>The switch can supports VLAN-based Mirroring. If you want to monitor some VLANs on the switch, you can set the selected VLANs on this field.</p>
<ul style="list-style-type: none"> • Remote Mirroring Port Configuration 	<p>The following table is used for port role selecting.</p> <ul style="list-style-type: none"> ■ Port: The logical port for the settings contained in the same row.. ■ Source: Select mirror mode. <ul style="list-style-type: none"> Disabled Neither frames transmitted nor frames received are mirrored. Both Frames received and frames transmitted are mirrored on the Destination port. Rx only Frames received on this port are mirrored on the Destination port. Frames transmitted are not mirrored. Tx only Frames transmitted on this port are mirrored on the Destination port. Frames received are not mirrored ■ Destination: Select destination port. <p>This checkbox is designed for mirror or Remote Mirroring.</p> <p>The destination port is a switched port that you receive a copy of traffic from the source port.</p>

For a given port, a frame is only transmitted once. It is therefore not possible to mirror Tx frames on the **mirror port**. Because of this, **mode** for the selected mirror port is limited to **Disabled** or **Rx only**.

4.3.2 Link Aggregation

Port Aggregation optimizes port usage by linking a group of ports together to form a single Link Aggregated Groups (LAGs). Port Aggregation multiplies the bandwidth between the devices, increases port flexibility, and provides link redundancy.

Each LAG is composed of ports of the same speed, set to full-duplex operations. Ports in a LAG, can be of different media types (UTP/Fiber, or different fiber types), provided they operate at the same speed.

Aggregated Links can be assigned manually (**Port Trunk**) or automatically by enabling Link Aggregation Control Protocol (**LACP**) on the relevant links.

Aggregated Links are treated by the system as a single logical port. Specifically, the Aggregated Link has similar port attributes to a non-aggregated port, including auto-negotiation, speed, Duplex setting, etc.

The device supports the following Aggregation links :

- **Static LAGs (Port Trunk)** – Force aggregated selected ports to be a trunk group.
- **Link Aggregation Control Protocol (LACP)** LAGs - LACP LAG negotiate Aggregated Port links with other LACP ports located on a different device. If the other device ports are also LACP ports, the devices establish a LAG between them.

Figure 4-3-2-1: Link Aggregation

The **Link Aggregation Control Protocol (LACP)** provides a standardized means for exchanging information between Partner Systems that require high speed redundant links. Link aggregation lets you group up to eight consecutive ports into a single dedicated connection. This feature can expand bandwidth to a device on the network. LACP operation requires full-duplex mode, more detail information refer to the IEEE 802.3ad standard.

Port link aggregations can be used to increase the bandwidth of a network connection or to ensure fault recovery. Link aggregation lets you group up to 4 consecutive ports into a single dedicated connection between any two the Switch or other Layer 2 switches. However, before making any physical connections between devices, use the Link aggregation Configuration menu to specify the link aggregation on the devices at both ends. When using a port link aggregation, note that:

- The ports used in a link aggregation must all be of the same media type (RJ45, 100 Mbps fiber).
- The ports that can be assigned to the same link aggregation have certain other restrictions (see below).
- Ports can only be assigned to one link aggregation.
- The ports at both ends of a connection must be configured as link aggregation ports.
- None of the ports in a link aggregation can be configured as a mirror source port or a mirror target port.
- All of the ports in a link aggregation have to be treated as a whole when moved from/to, added or deleted from a VLAN.
- The Spanning Tree Protocol will treat all the ports in a link aggregation as a whole.
- Enable the link aggregation prior to connecting any cable between the switches to avoid creating a data loop.
- Disconnect all link aggregation port cables or disable the link aggregation ports before removing a port link aggregation to avoid creating a data loop.

It allows a maximum of 10 ports to be aggregated at the same time. The Managed Switch support Gigabit Ethernet ports (up to 5 groups). If the group is defined as a LACP static link aggregation group, then any extra ports selected are placed in a standby mode for redundancy if one of the other ports fails. If the group is defined as a local static link aggregation group, then the number of ports must be the same as the group member ports.

The aggregation code ensures that frames belonging to the same frame flow (for example, a TCP connection) are always forwarded on the same link aggregation member port. Recording of frames within a flow is therefore not possible. The aggregation code is based on the following information:

- **Source MAC**
- **Destination MAC**
- **Source and destination IPv4 address.**
- **Source and destination TCP/UDP ports for IPv4 packets**

Normally, all 5 contributions to the aggregation code should be enabled to obtain the best traffic distribution among the link aggregation member ports. Each link aggregation may consist of up to 10 member ports. Any quantity of link aggregation s may be configured for the device (only limited by the quantity of ports on the device.) To configure a proper traffic distribution, the ports within a link aggregation must use the same link speed.

4.3.2.1 Common

This page is used to configure the Aggregation hash mode and the aggregation group. The aggregation hash mode settings are global.

Hash Code Contributors

The Common Aggregation Configuration screen in [Figure 4-3-2-1](#) appears.

4.3.3 VLANs

4.3.3.1 VLAN Overview

A **Virtual Local Area Network (VLAN)** is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLAN also logically segment the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

VLAN can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains. A VLAN is a collection of end nodes grouped by logic instead of physical location. End nodes that frequently communicate with each other are assigned to the same VLAN, regardless of where they are physically on the network. Logically, a VLAN can be equated to a broadcast domain, because broadcast packets are forwarded to only members of the VLAN on which the broadcast was initiated.

1. No matter what basis is used to uniquely identify end nodes and assign these nodes VLAN membership, packets cannot cross VLAN without a network device performing a routing function between the VLANs.
2. The Managed Switch supports IEEE 802.1Q VLAN. The port untagging function can be used to remove the 802.1 tag from packet headers to maintain compatibility with devices that are tag-unaware..

The Managed Switch's default is to assign all ports to a single 802.1Q VLAN named DEFAULT_VLAN. As new VLAN is created, the member ports assigned to the new VLAN will be removed from the DEFAULT_VLAN port member list. The DEFAULT_VLAN has a VID = 1.

This section has the following items:

- **VLAN Port Configuration** Enables VLAN group
- **VLAN Membership Status** Displays VLAN membership status
- **VLAN Port Status** Displays VLAN port status
- **SVL** Shared VLAN Learning Configuration
- **VLAN Translation** VLAN Translation Port Configuration
- **VLAN Translation Mappings** VLAN Translation Mapping Table
- **Private VLAN** Creates/removes primary or community VLANs
- **Port Isolation** Enables/disables port isolation on port
- **MAC-based VLAN** Configures the MAC-based VLAN entries
- **MAC-based VLAN Status** Displays MAC-based VLAN entries
- **Protocol-based VLAN** Configures the protocol-based VLAN entries
- **Protocol-based VLAN Membership** Displays the protocol-based VLAN entries

4.3.3.2 IEEE 802.1Q VLAN

In large networks, routers are used to isolate broadcast traffic for each subnet into separate domains. This Managed Switch provides a similar service at Layer 2 by using VLANs to organize any group of network nodes into separate broadcast domains. VLANs confine broadcast traffic to the originating group, and can eliminate broadcast storms in large networks. This also provides a more secure and cleaner network environment.

An IEEE 802.1Q VLAN is a group of ports that can be located anywhere in the network, but communicate as though they belong to the same physical segment.

VLANs help to simplify network management by allowing you to move devices to a new VLAN without having to change any physical connections. VLANs can be easily organized to reflect departmental groups (such as Marketing or R&D), usage groups (such as e-mail), or multicast groups (used for multimedia applications such as videoconferencing).

VLANs provide greater network efficiency by reducing broadcast traffic, and allow you to make network changes without having to update IP addresses or IP subnets. VLANs inherently provide a high level of network security since traffic must pass through a configured Layer 3 link to reach a different VLAN.

This Managed Switch supports the following VLAN features:

- Up to 255 VLANs based on the IEEE 802.1Q standard
- Port overlapping, allowing a port to participate in multiple VLANs
- End stations can belong to multiple VLANs
- Passing traffic between VLAN-aware and VLAN-unaware devices
- Priority tagging

■ IEEE 802.1Q Standard

IEEE 802.1Q (tagged) VLAN are implemented on the Switch. 802.1Q VLAN require tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLAN allow a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLAN can also provide a level of security to your network. IEEE 802.1Q VLAN will only deliver packets between stations that are members of the VLAN. Any port can be configured as either **tagging** or **untagging**.

- The untagging feature of IEEE 802.1Q VLAN allows VLAN to work with legacy switches that don't recognize VLAN tags in packet headers.
- The tagging feature allows VLAN to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

Some relevant terms:

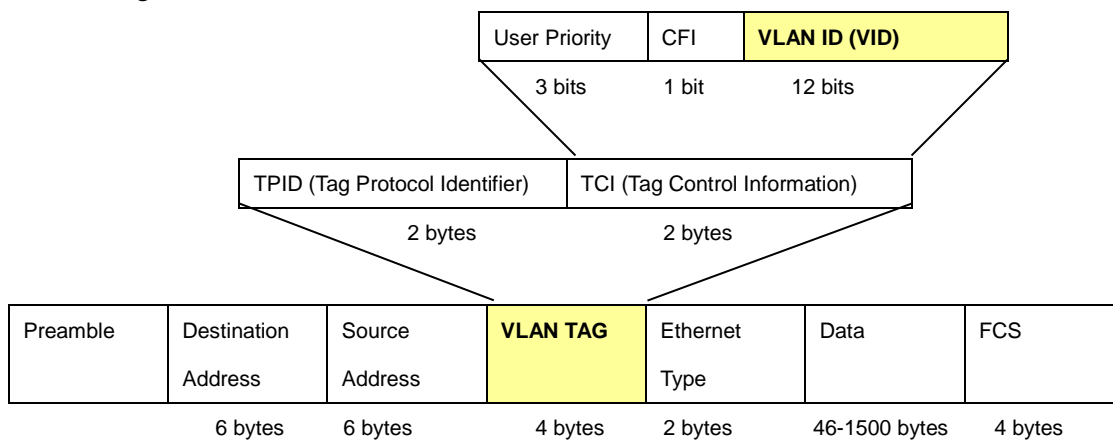

- **Tagging** - The act of putting 802.1Q VLAN information into the header of a packet.
- **Untagging** - The act of stripping 802.1Q VLAN information out of the packet header.

802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of **0x8100** in the Ether Type field. When a packet's Ether Type field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI - used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of **VLAN ID (VID)**. The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLAN can be identified.

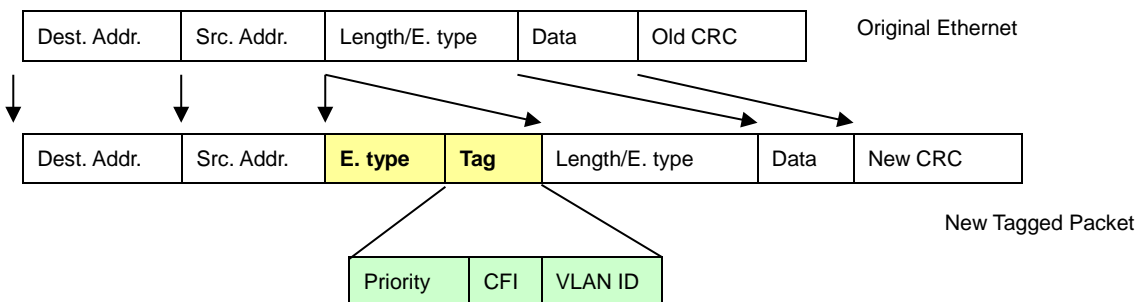

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

802.1Q Tag

The Ether Type and VLAN ID are inserted after the MAC source address, but before the original Ether Type/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

Adding an IEEE802.1Q Tag

■ Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLAN to span network devices (and indeed, the entire network – if all network devices are 802.1Q compliant).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the switch. If no VLAN are defined on the switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLAN are concerned. Tagged packets are forwarded according to the VID contained within the tag. Tagged packets are also assigned a PVID, but the PVID is not used to make packet forwarding decisions, the VID is.

Tag-aware switches must keep a table to relate PVID within the switch to VID on the network. The switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VID are different the switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VID as the switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

■ Default VLANs

The Switch initially configures one VLAN, VID = 1, called "**default**." The factory default setting assigns all ports on the Switch to the "**default**". As new VLAN are configured in Port-based mode, their respective member ports are removed from the "**default**."

■ Assigning Ports to VLANs

Before enabling VLANs for the switch, you must first assign each port to the VLAN group(s) in which it will participate. By default all ports are assigned to VLAN 1 as untagged ports. Add a port as a tagged port if you want it to carry traffic for one or more VLANs, and any intermediate network devices or the host at the other end of the connection supports VLANs. Then assign ports on the other VLAN-aware network devices along the path that will carry this traffic to the same VLAN(s), either manually or dynamically using GVRP. However, if you want a port on this switch to participate in one or more VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, then you should add this port to the VLAN as an untagged port.

VLAN-tagged frames can pass through VLAN-aware or VLAN-unaware network interconnection devices, but the VLAN tags should be stripped off before passing it on to any end-node host that does not support VLAN tagging.

■ VLAN Classification

When the switch receives a frame, it classifies the frame in one of two ways. If the frame is untagged, the switch assigns the frame to an associated VLAN (based on the default VLAN ID of the receiving port). But if the frame is tagged, the switch uses the tagged VLAN ID to identify the port broadcast domain of the frame.

■ Port Overlapping

Port overlapping can be used to allow access to commonly shared network resources among different VLAN groups, such as file servers or printers. Note that if you implement VLANs which do not overlap, but still need to communicate, you can connect them by enabled routing on this switch.

■ Untagged VLANs

Untagged (or static) VLANs are typically used to reduce broadcast traffic and to increase security. A group of network users assigned to a VLAN form a broadcast domain that is separate from other VLANs configured on the switch. Packets are forwarded only between ports that are designated for the same VLAN. Untagged VLANs can be used to manually isolate user groups or subnets.

4.3.3.3 VLAN Port Configuration

This page is used for configuring the Managed Switch port VLAN. The VLAN per Port Configuration page contains fields for managing ports that are part of a VLAN. The port default VLAN ID (PVID) is configured on the VLAN Port Configuration page. All untagged packets arriving to the device are tagged by the ports PVID.

Understand nomenclature of the Switch

■ IEEE 802.1Q Tagged and Untagged

Every port on an 802.1Q compliant switch can be configured as tagged or untagged.

- Tagged:** Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into those ports. If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. The VLAN information in the tag can then be used by other 802.1Q compliant devices on the network to make packet-forwarding decisions.
- Untagged:** Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

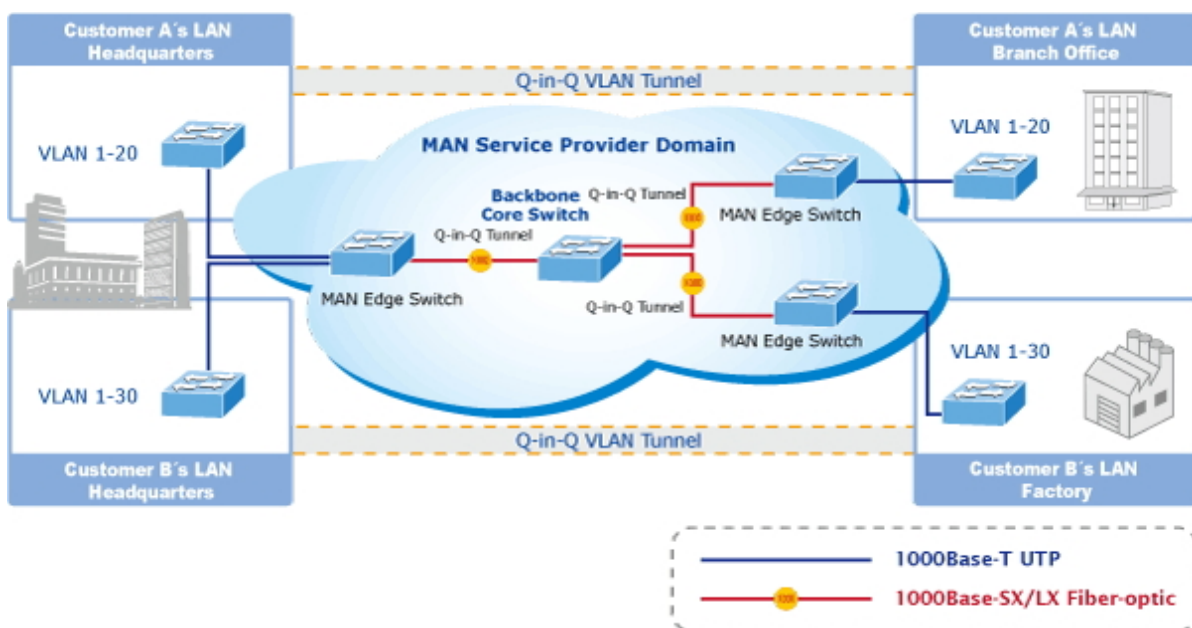

Frame Income / Frame Leave	Income Frame is tagged	Income Frame is untagged
Leave port is tagged	Frame remains tagged	Tag is inserted
Leave port is untagged	Tag is removed	Frame remain untagged

Table 4-3-3-1: Ingress / Egress Port with VLAN VID Tag / Untag Table

■ IEEE 802.1Q Tunneling (Q-in-Q)

IEEE 802.1Q Tunneling (Q-in-Q) is designed for service providers carrying traffic for multiple customers across their networks. Q-in-Q tunneling is used to maintain customer-specific VLAN and Layer 2 protocol configurations even when different customers use the same internal VLAN IDs. This is accomplished by inserting **Service Provider VLAN (SPVLAN)** tags into the customer's frames when they enter the service provider's network, and then stripping the tags when the frames leave the network.

A service provider's customers may have specific requirements for their internal VLAN IDs and number of VLANs supported. VLAN ranges required by different customers in the same service-provider network might easily overlap, and traffic passing through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations, require intensive processing of VLAN mapping tables, and could easily exceed the maximum VLAN limit of 4096.

The Managed Switch supports multiple VLAN tags and can therefore be used in MAN applications as a provider bridge, aggregating traffic from numerous independent customer LANs into the **MAN (Metro Access Network)** space. One of the purposes of the provider bridge is to recognize and use VLAN tags so that the VLANs in the MAN space can be used independent of the customers' VLANs. This is accomplished by adding a VLAN tag with a MAN-related VID for frames entering the MAN. When leaving the MAN, the tag is stripped and the original VLAN tag with the customer-related VID is again available.

This provides a tunneling mechanism to connect remote customer VLANs through a common MAN space without interfering with the VLAN tags. All tags use EtherType **0x8100** or **0x88A8**, where 0x8100 is used for customer tags and 0x88A8 are used for service provider tags.

In cases where a given service VLAN only has two member ports on the switch, the learning can be disabled for the particular VLAN and can therefore rely on flooding as the forwarding mechanism between the two ports. This way, the MAC table requirements is reduced.

Global VLAN Configuration

The Global VLAN Configuration screen in [Figure 4-3-3-2](#) appears.

Global VLAN Configuration	
Allowed Access VLANs	1
Ethertype for Custom S-ports	88A8

Figure 4-3-3-2 : Global VLAN Configuration Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Allowed Access VLANs 	<p>This field shows the allowed Access VLANs, it only affects ports configured as Access ports. Ports in other modes are members of all VLANs specified in the Allowed VLANs field.</p> <p>By default, only VLAN 1 is enabled. More VLANs may be created by using a list syntax where the individual elements are separated by commas. Ranges are specified with a dash separating the lower and upper bound.</p> <p>The following example will create VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-13,200,300. Spaces are allowed in between the delimiters.</p>
<ul style="list-style-type: none"> Ethertype for Custom S-ports 	<p>This field specifies the ethertype/TPID (specified in hexadecimal) used for Custom S-ports. The setting is in force for all ports whose Port Type is set to S-Custom-Port.</p>

Port VLAN Configuration

The VLAN Port Configuration screen in [Figure 4-3-3-3](#) appears.

8	Access	1	C-Port	<input checked="" type="checkbox"/>	Tagged and Untagged	Untag Port VLAN	1	

Figure 4-3-3-3: Port VLAN Configuration Screenshot

The page includes the following fields:

Object		Description
• Port		This is the logical port number for this row.
• Mode	Access	<p>Access ports are normally used to connect to end stations. Dynamic features like Voice VLAN may add the port to more VLANs behind the scenes. Access ports have the following characteristics:</p> <ul style="list-style-type: none"> • Member of exactly one VLAN, the Port VLAN (Access VLAN), which by default is 1 • Accepts untagged and C-tagged frames • Discards all frames that are not classified to the Access VLAN • On egress all frames classified to the Access VLAN are transmitted untagged. Other (dynamically added VLANs) are transmitted tagged
	Trunk	<p>Trunk ports can carry traffic on multiple VLANs simultaneously, and are normally used to connect to other switches. Trunk ports have the following characteristics:</p> <ul style="list-style-type: none"> • By default, a trunk port is member of all VLANs (1-4095) • The VLANs that a trunk port is member of may be limited by the use of Allowed VLANs • Frames classified to a VLAN that the port is not a member of are discarded • By default, all frames but frames classified to the Port VLAN (a.k.a. Native VLAN) get tagged on egress. Frames classified to the Port VLAN do not get C-tagged on egress • Egress tagging can be changed to tag all frames, in which case only tagged frames are accepted on ingress
	Hybrid	<p>Hybrid ports resemble trunk ports in many ways, but adds additional port configuration features. In addition to the characteristics described for trunk ports, hybrid ports have these abilities:</p> <ul style="list-style-type: none"> • Can be configured to be VLAN tag unaware, C-tag aware, S-tag aware, or S-custom-tag aware • Ingress filtering can be controlled • Ingress acceptance of frames and configuration of egress tagging can be configured independently

<ul style="list-style-type: none"> • Port VLAN 	<p>Determines the port's VLAN ID (PVID). Allowed VLANs are in the range 1 through 4095, default being 1.</p> <ul style="list-style-type: none"> ■ On ingress, frames get classified to the Port VLAN if the port is configured as VLAN unaware, the frame is untagged, or VLAN awareness is enabled on the port, but the frame is priority tagged (VLAN ID = 0). ■ On egress, frames classified to the Port VLAN do not get tagged if Egress Tagging configuration is set to untag Port VLAN. <p>The Port VLAN is called an "Access VLAN" for ports in Access mode and Native VLAN for ports in Trunk or Hybrid mode.</p>
<ul style="list-style-type: none"> • Port Type 	<p>Ports in hybrid mode allow for changing the port type, that is, whether a frame's VLAN tag is used to classify the frame on ingress to a particular VLAN, and if so, which TPID it reacts on. Likewise, on egress, the Port Type determines the TPID of the tag, if a tag is required.</p> <ul style="list-style-type: none"> ■ Unaware: On ingress, all frames, whether carrying a VLAN tag or not, get classified to the Port VLAN, and possible tags are not removed on egress. ■ C-Port: On ingress, frames with a VLAN tag with TPID = 0x8100 get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with a C-tag. ■ S-Port: On ingress, frames with a VLAN tag with TPID = 0x8100 or 0x88A8 get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with an S-tag. ■ S-Custom-Port: On ingress, frames with a VLAN tag with a TPID = 0x8100 or equal to the Ethertype configured for Custom-S ports get classified to the VLAN ID embedded in the tag. If a frame is untagged or priority tagged, the frame gets classified to the Port VLAN. If frames must be tagged on egress, they will be tagged with the custom S-tag.
<ul style="list-style-type: none"> • Ingress Filtering 	<p>Hybrid ports allow for changing ingress filtering. Access and Trunk ports always have ingress filtering enabled.</p> <ul style="list-style-type: none"> ■ If ingress filtering is enabled (checkbox is checked), frames classified to a VLAN that the port is not a member of get discarded. ■ If ingress filtering is disabled, frames classified to a VLAN that the port is not a member of are accepted and forwarded to the switch engine. <p>However, the port will never transmit frames classified to VLANs that it is not a member of.</p>

<ul style="list-style-type: none"> • Ingress Acceptance 	<p>Hybrid ports allow for changing the type of frames that are accepted on ingress.</p> <ul style="list-style-type: none"> ■ Tagged and Untagged Both tagged and untagged frames are accepted. ■ Tagged Only Only tagged frames are accepted on ingress. Untagged frames are discarded. ■ Untagged Only Only untagged frames are accepted on ingress. Tagged frames are discarded.
<p>Egress Tagging</p>	<p>This option is only available for ports in Hybrid mode. Ports in Trunk and Hybrid mode may control the tagging of frames on egress.</p> <ul style="list-style-type: none"> ■ Untag Port VLAN Frames classified to the Port VLAN are transmitted untagged. Other frames are transmitted with the relevant tag. ■ Tag All All frames, whether classified to the Port VLAN or not, are transmitted with a tag. ■ Untag All All frames, whether classified to the Port VLAN or not, are transmitted without a tag.
<ul style="list-style-type: none"> • Allowed VLANs 	<p>Ports in Trunk and Hybrid mode may control which VLANs they are allowed to become members of. The field's syntax is identical to the syntax used in the Enabled VLANs field.</p> <p>By default, a Trunk or Hybrid port will become member of all VLANs, and is therefore set to 1-4095. The field may be left empty, which means that the port will not become member of any VLANs.</p>
<ul style="list-style-type: none"> • Forbidden VLANs 	<p>A port may be configured to never be member of one or more VLANs. This is particularly useful when dynamic VLAN protocols like MVRP and GVRP must be prevented from dynamically adding ports to VLANs. The trick is to mark such VLANs as forbidden on the port in question. The syntax is identical to the syntax used in the Enabled VLANs field.</p> <p>By default, the field is left blank, which means that the port may become a member of all possible VLANs.</p>

The port must be a member of the same VLAN as the Port VLAN ID.

Buttons

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.3.3.4 VLAN Membership Status

This page provides an overview of membership status for VLAN users. The VLAN Membership Status screen in [Figure 4-6-4](#) appears.

VLAN Membership Status for Combined users

▾ Auto-refresh

Start from VLAN with entries per page.

VLAN ID	Port Members									
	1	2	3	4	5	6	7	8	9	10
1	✓	✓	✓	✓	✓	✓	✓	✓	✓	✓

Figure 4-3-3-4: VLAN Membership Status for Combined User Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> VLAN User 	<p>A VLAN User is a module that uses services of the VLAN management functionality to configure VLAN memberships and VLAN port configuration such as PVID, UVID. Currently we support following VLAN :</p> <ul style="list-style-type: none"> - Admin : This is referred as static. - NAS : NAS provides port-based authentication, which involves communications between a Supplicant, Authenticator, and an Authentication Server. - GVRP : GVRP (GARP VLAN Registration Protocol or Generic VLAN Registration Protocol) is a protocol that facilitates control of virtual local area networks (VLANs) within a larger network . - Voice VLAN : Voice VLAN is a VLAN configured specially for voice traffic typically originating from IP phones. - MVR : MVR is used to eliminate the need to duplicate multicast traffic for subscribers in each VLAN. Multicast traffic for all channels is sent only on a single (multicast) VLAN.

<ul style="list-style-type: none"> • Port Members 	<p>A row of check boxes for each port is displayed for each VLAN ID.</p> <p>If a port is included in a VLAN, an image <input checked="" type="checkbox"/> will be displayed.</p> <p>If a port is included in a Forbidden port list, an image <input checked="" type="checkbox"/> will be displayed.</p> <p>If a port is included in a Forbidden port list and dynamic VLAN user register VLAN on same Forbidden port, then conflict port will be displayed as conflict port.</p>
<ul style="list-style-type: none"> • VLAN Membership 	<p>The VLAN Membership Status page shall show the current VLAN port members for all VLANs configured by a selected VLAN User (selection shall be allowed by a Combo Box). When ALL VLAN Users are selected, it shall show this information for all the VLAN Users, and this is by default. VLAN membership allows the frames classified to the VLAN ID to be forwarded on the respective VLAN member ports.</p>

Buttons

: Select VLAN Users from this drop down list.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

: Updates the table starting from the first entry in the VLAN Table, i.e. the entry with the lowest VLAN ID.

: Updates the table, starting with the entry after the last entry currently displayed.

4.3.3.5 VLAN Port Status

This page provides VLAN Port Status. The VLAN Port Status screen in [Figure 4-3-3-5](#) appears.

Port	Port Type	Ingress Filtering	Frame Type	Port VLAN ID	Tx Tag	Untagged VLAN ID	Conflicts
1	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
2	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
3	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
4	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
5	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
6	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
7	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No
8	C-Port	<input checked="" type="checkbox"/>	All	1	Untag All		No

Figure 4-3-3-5: VLAN Port Status for Combined users Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings contained in the same row.
• Port Type	Show the VLAN Awareness for the port. If VLAN awareness is enabled, the tag is removed from tagged frames received on the port. VLAN tagged frames are classified to the VLAN ID in the tag. If VLAN awareness is disabled, all frames are classified to the Port VLAN ID and tags are not removed.
• Ingress Filtering	Show the ingress filtering for a port. This parameter affects VLAN ingress processing. If ingress filtering is enabled and the ingress port is not a member of the classified VLAN of the frame, the frame is discarded.
• Frame Type	Shows whether the port accepts all frames or only tagged frames. This parameter affects VLAN ingress processing. If the port only accepts tagged frames, untagged frames received on that port are discarded.
• Port VLAN ID	Shows the PVID setting for the port.
• Tx Tag	Shows egress filtering frame status whether tagged or untagged.
• Untagged VLAN ID	Shows UVID (untagged VLAN ID). Port's UVID determines the packet's behavior at the egress side.
• Conflicts	Shows status of Conflicts whether exists or Not. When a Volatile VLAN User requests to set VLAN membership or VLAN port configuration, the following conflicts can occur: <ul style="list-style-type: none"> ■ Functional Conflicts between feature. ■ Conflicts due to hardware limitation. ■ Direct conflict between user modules.

Buttons

: Select VLAN Users from this drop down list.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

4.3.3.6 SVL

This page allows for controlling [SVL](#) configuration on the switch. In SVL, one or more VLANs map to a Filter ID (FID). By default, there is a one-to-one mapping from VLAN to FID, in which case the switch acts as an [IVL](#) bridge, but with SVL multiple VLANs may share the same MAC address table entries..

Shared VLAN Learning Configuration

Figure 4-3-3-6: Shared VLAN Learning Configuration page screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	A previously allocated FID can be deleted by the use of this button.
<ul style="list-style-type: none"> • FID 	The Filter ID (FID) is the ID that VLANs get learned on in the MAC table when SVL is in effect. No two rows in the table can have the same FID and the FID must be a number between 1 and 4095.
<ul style="list-style-type: none"> • VLANs 	<p>List of VLANs mapped into FID.</p> <p>The syntax is as follows: Individual VLANs are separated by commas. Ranges are specified with a dash separating the lower and upper bound.</p> <p>The following example will map VLANs 1, 10, 11, 12, 13, 200, and 300: 1,10-13,200,300. Spaces are allowed in between the delimiters. The range of valid VLANs is 1 to 4095.</p> <p>The same VLAN can only be a member of one FID. A message will be displayed if one VLAN is grouped into two or more FIDs.</p> <p>All VLANs must map to a particular FID, and by default VLAN x maps to FID x. This implies that if FID x is defined, then VLAN x is implicitly a member of FID x unless it is specified for another FID. If FID x doesn't exist, a confirmation message will be displayed, asking whether to continue adding VLAN x implicitly to FID x.</p>

Buttons

Add FID: Add a new row to the SVL table. The FID will be pre-filled with the first unused FID.

Apply: Click to apply changes.

Reset: Click to undo any changes made locally and revert to previously saved values.

4.3.4 VLAN Translation

4.3.4.1 Port to Group Configuration

This page allows you to configure switch Ports to use a given VLAN Translation Mapping Group. This will enable all VLAN Translation mappings of that group (if any) on the selected switch port.

Auto-refresh

 : Click to refresh the page

 : Click to remove all VLAN Translation mappings.

4.3.6 Private VLANs

4.3.6.1 Private VLAN Configuration

The Private VLAN membership configurations for the switch can be monitored and modified here. Private VLANs can be added or deleted here. Port members of each Private VLAN can be added or removed here.

Private VLANs are based on the source port mask, and there are no connections to VLANs. This means that VLAN IDs and Private VLAN IDs can be identical.

A port must be a member of both a VLAN and a Private VLAN to be able to forward packets. By default, all ports are VLAN unaware and members of VLAN 1 and Private VLAN 1.

A VLAN unaware port can only be a member of one VLAN, but it can be a member of multiple Private VLANs. The VLAN Port Status screen in [Figure 4-3-6-1](#) appears.

Figure 4-3-6-1: Private VLAN Membership Configuration page screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Delete 	To delete a private VLAN entry, check this box. The entry will be deleted during the next save.
<ul style="list-style-type: none"> Private VLAN ID 	Indicates the ID of this particular private VLAN.
<ul style="list-style-type: none"> Port Members 	A row of check boxes for each port is displayed for each private VLAN ID. To include a port in a Private VLAN, check the box. To remove or exclude the port from the Private VLAN, make sure the box is unchecked. By default, no ports are members, and all boxes are unchecked.
<ul style="list-style-type: none"> Adding a New Private VLAN 	<p>Click to add a new private VLAN ID. An empty row is added to the table, and the private VLAN can be configured as needed. The allowed range for a private VLAN ID is the same as the switch port number range. Any values outside this range are not accepted, and a warning message appears. Click "OK" to discard the incorrect entry, or click "Cancel" to return to the editing and make a correction.</p> <p>The Private VLAN is enabled when you click "Save".</p> <p>The button can be used to undo the addition of new Private VLANs.</p>

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

: Click to apply changes

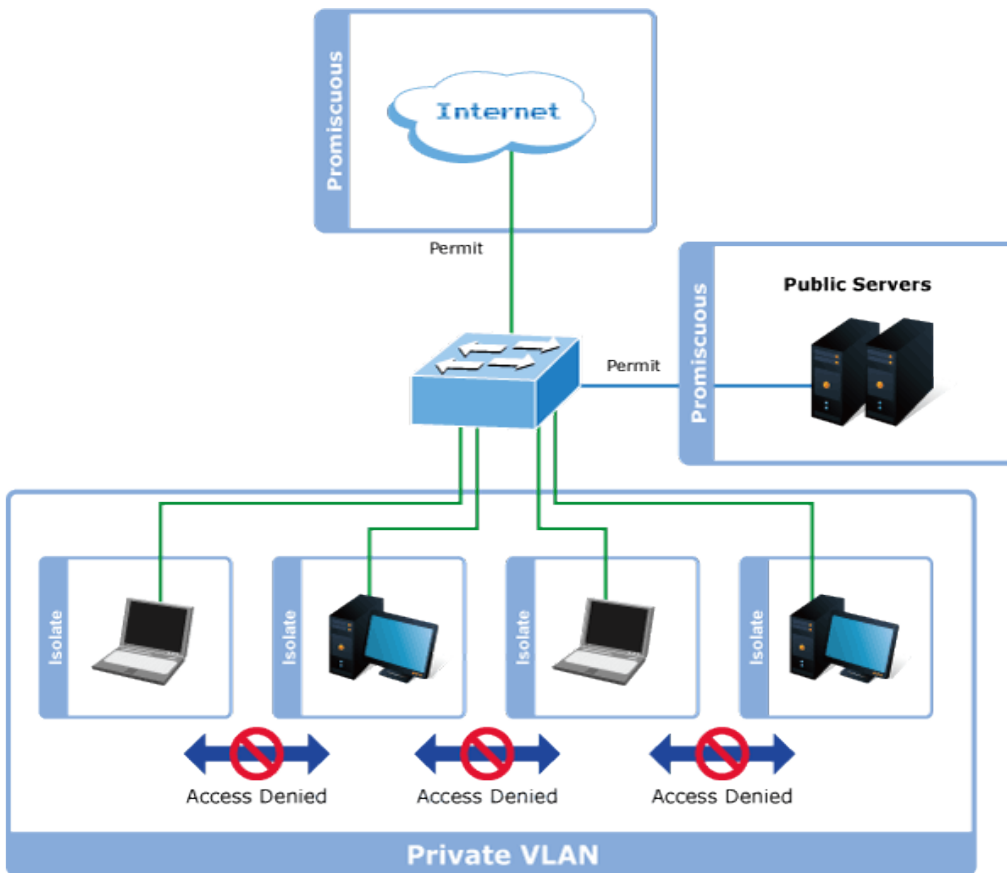

: Click to undo any changes made locally and revert to previously saved values.

4.3.6.2 Port Isolation

Overview

When a VLAN is configured to be a private VLAN, communication between ports within that VLAN can be prevented. Two application examples are provided in this section:

- Customers connected to an ISP can be members of the same VLAN, but they are not allowed to communicate with each other within that VLAN.
- Servers in a farm of web servers in a Demilitarized Zone (DMZ) are allowed to communicate with the outside world and with database servers on the inside segment, but are not allowed to communicate with each other

For private VLANs to be applied, the switch must first be configured for standard VLAN operation. When this is in place, one or more of the configured VLANs can be configured as private VLANs. Ports in a private VLAN fall into one of these two groups:

■ **Promiscuous ports**

- Ports from which traffic can be forwarded to all ports in the private VLAN
- Ports which can receive traffic from all ports in the private VLAN

■ **Isolated ports**

- Ports from which traffic can only be forwarded to promiscuous ports in the private VLAN
- Ports which can receive traffic from only promiscuous ports in the private VLAN

The configuration of promiscuous and isolated ports applies to all private VLANs. When traffic comes in on a promiscuous port in a private VLAN, the VLAN mask from the VLAN table is applied. When traffic comes in on an isolated port, the private VLAN mask is applied in addition to the VLAN mask from the VLAN table. This reduces the ports to which forwarding can be done to just the promiscuous ports within the private VLAN.

This page is used for enabling or disabling port isolation on ports in a Private VLAN. A port member of a VLAN can be isolated to other isolated ports on the same VLAN and Private VLAN. The Port Isolation screen in [Figure 4-3-6-2](#) appears.

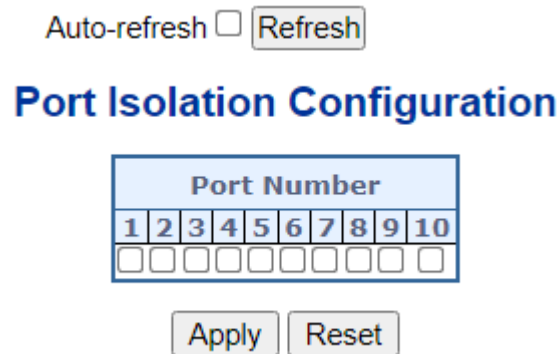

Figure 4-3-6-2: Port Isolation Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port Members 	<p>A check box is provided for each port of a private VLAN. When checked, port isolation is enabled on that port. When unchecked, port isolation is disabled on that port.</p> <p>By default, port isolation is disabled on all ports.</p>

4.3.7 VCL

4.3.7.1 MAC-based VLAN

The MAC-based VLAN entries can be configured here. This page allows for adding and deleting MAC-based VLAN entries and assigning the entries to different ports. This page shows only static entries. The MAC-based VLAN screen in [Figure 4-3-7-1](#) appears.

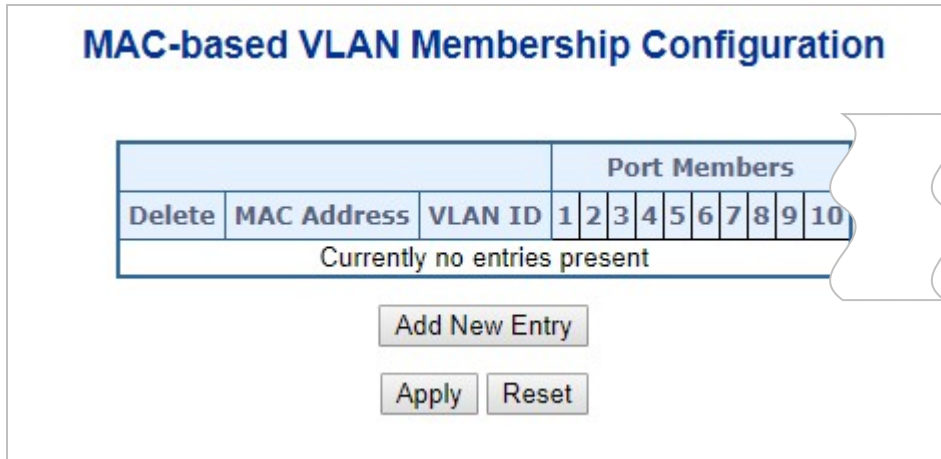

Figure 4-3-7-1: MAC-based VLAN Membership Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	To delete a MAC-based VLAN entry, check this box and press save.
<ul style="list-style-type: none"> • MAC Address 	Indicates the MAC address.
<ul style="list-style-type: none"> • VLAN ID 	Indicates the VLAN ID.
<ul style="list-style-type: none"> • Port Members 	A row of check boxes for each port is displayed for each MAC-based VLAN entry. To include a port in a MAC-based VLAN, check the box. To remove or exclude the port from the MAC-based VLAN, make sure the box is unchecked. By default, no ports are members, and all boxes are unchecked.
<ul style="list-style-type: none"> • Adding a New MAC-based VLAN 	<p>Click "Add New Entry" to add a new MAC-based VLAN entry. An empty row is added to the table, and the MAC-based VLAN entry can be configured as needed. Any unicast MAC address can be configured for the MAC-based VLAN entry. No broadcast or multicast MAC addresses are allowed. Legal values for a VLAN ID are 1 through 4095.</p> <p>The MAC-based VLAN entry is enabled when you click on "Save". A MAC-based VLAN without any port members will be deleted when you click "Save".</p> <p>The "Delete" button can be used to undo the addition of new MAC-based VLANs.</p>

Buttons

Add New Entry: Click to add a new MAC-based VLAN entry.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Click to refresh the page immediately.

<<: Updates the table starting from the first entry in the MAC-based VLAN Table.

>>: Updates the table, starting with the entry after the last entry currently displayed.

4.3.7.2 IP Subnet-based VLAN

The IP subnet to VLAN ID mappings can be configured here. This page allows adding, updating and deleting IP subnet to VLAN ID mapping entries and assigning them to different ports.

Auto-refresh **Refresh**

IP Subnet-based VLAN Membership Configuration

				Port Members									
Delete	IP Address	Mask Length	VLAN ID	1	2	3	4	5	6	7	8	9	10
Currently no entries present													

Add New Entry

Apply **Reset**

The displayed settings are:

Object	Description
• Delete	To delete a mapping, check this box and press save. The entry will be deleted in the stack.
• IP Address	Indicates the subnet's IP address (Any of the subnet's host addresses can be also provided here, the application will convert it automatically).
• Mask Length	Indicates the subnet's mask length.
• VLAN ID	Indicates the VLAN ID the subnet will be mapped to. IP Subnet to VLAN ID is a unique matching.
• Port Members	A row of check boxes for each port is displayed for each IP subnet to VLAN ID mapping entry. To include a port in a mapping, simply check the box. To remove or exclude the port from the mapping, make sure the box is unchecked. By default, no ports are members and all boxes are unchecked.

- **Adding a New IP subnet-based VLAN**

Click to add a new IP subnet to VLAN ID mapping entry. An empty row is added to the table, and the mapping can be configured as needed. Any IP address/mask can be configured for the mapping. Legal values for the VLAN ID are 1 to 4095.

The IP subnet to VLAN ID mapping entry is enabled when you click on "Save".

The button can be used to undo the addition of new mappings. The maximum possible IP subnet to VLAN ID mappings are limited to 128

Buttons

4.3.8 GVRP

GVRP (**G**ARP VLAN Registration Protocol or **G**eneric VLAN Registration Protocol) is a protocol that facilitates control of virtual local area networks (VLANs) within a larger network. It defines a way for switches to exchange VLAN information in order to register VLAN members on ports across the network.

VLANs are **dynamically** configured based on **join messages** issued by host devices and propagated throughout the network. GVRP must be enabled to permit automatic VLAN registration, and to support VLANs which extend beyond the local switch.

4.3.8.1 GVRP Configuration

This page allows you to configure the global GVRP configuration settings that are commonly applied to all GVRP enabled ports. as well. as screen in [Figure 4-3-8-1](#) appears.

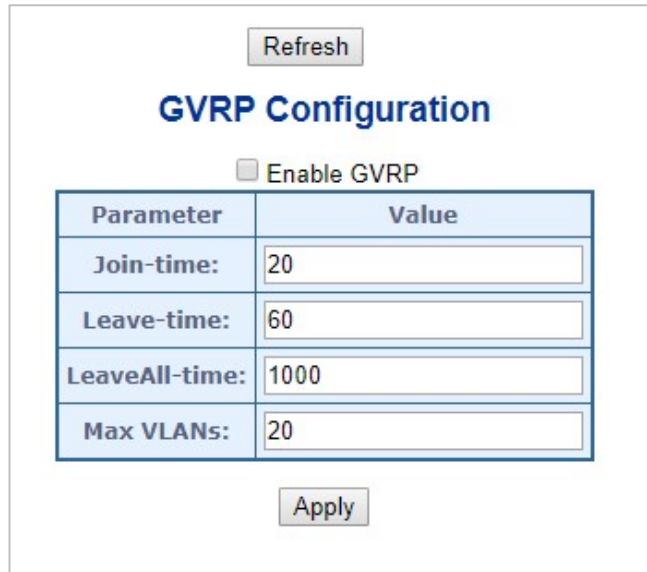

Figure 4-3-8-1: GVRP Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description
<ul style="list-style-type: none"> • Enable GVRP globally 	The GVRP feature is globally enabled by setting the check mark in the checkbox named Enable GVRP and pressing the Save button.
GVRP protocol timers	
<ul style="list-style-type: none"> • Join-time 	Join-time is a value in the range of 1-20cs, i.e. in units of one hundredth of a second. The default value is 20cs.
<ul style="list-style-type: none"> • Leave-time 	Leave-time is a value in the range of 60-300cs, i.e. in units of one hundredth of a second. The default is 60cs.
<ul style="list-style-type: none"> • LeaveAll-time 	LeaveAll-time is a value in the range of 1000-5000cs, i.e. in units of one hundredth of a second. The default is 1000cs
<ul style="list-style-type: none"> • Max number of VLANs 	When GVRP is enabled, a maximum number of VLANs supported by GVRP is specified. By default this number is 20. This number can only be changed when GVRP is turned off.

4.3.10 Spanning Tree

4.3.10.1 Theory

The Spanning Tree protocol can be used to detect and disable network loops, and to provide backup links between switches, bridges or routers. This allows the switch to interact with other bridging devices in your network to ensure that only one route exists between any two stations on the network, and provide backup links which automatically take over when a primary link goes down. The spanning tree algorithms supported by this switch include these versions:

- **STP – Spanning Tree Protocol (IEEE 802.1D)**
- **RSTP – Rapid Spanning Tree Protocol (IEEE 802.1w)**
- **MSTP – Multiple Spanning Tree Protocol (IEEE 802.1s)**

The **IEEE 802.1D Spanning Tree Protocol** and **IEEE 802.1w Rapid Spanning Tree Protocol** allow for the blocking of links between switches that form loops within the network. When multiple links between switches are detected, a primary link is established. Duplicated links are blocked from use and become standby links. The protocol allows for the duplicate links to be used in the event of a failure of the primary link. Once the Spanning Tree Protocol is configured and enabled, primary links are established and duplicated links are blocked automatically. The reactivation of the blocked links (at the time of a primary link failure) is also accomplished automatically without operator intervention.

This automatic network reconfiguration provides maximum uptime to network users. However, the concepts of the Spanning Tree Algorithm and protocol are a complicated and complex subject and must be fully researched and understood. It is possible to cause serious degradation of the performance of the network if the Spanning Tree is incorrectly configured. Please read the following before making any changes from the default values.

The Switch STP performs the following functions:

- Creates a single spanning tree from any combination of switching or bridging elements.
- Creates multiple spanning trees – from any combination of ports contained within a single switch, in user specified groups.
- Automatically reconfigures the spanning tree to compensate for the failure, addition, or removal of any element in the tree.
- Reconfigures the spanning tree without operator intervention.

Bridge Protocol Data Units

For STP to arrive at a stable network topology, the following information is used:

- The unique switch identifier
- The path cost to the root associated with each switch port
- The port identifier

STP communicates between switches on the network using Bridge Protocol Data Units (BPDUs). Each BPDU contains the following information:

- The unique identifier of the switch that the transmitting switch currently believes is the root switch
- The path cost to the root from the transmitting port
- The port identifier of the transmitting port

The switch sends BPDUs to communicate and construct the spanning-tree topology. All switches connected to the LAN on which the packet is transmitted will receive the BPDU. BPDUs are not directly forwarded by the switch, but the receiving switch uses the information in the frame to calculate a BPDU, and, if the topology changes, initiates a BPDU transmission.

The communication between switches via BPDUs results in the following:

- One switch is elected as the root switch
- The shortest distance to the root switch is calculated for each switch
- A designated switch is selected. This is the switch closest to the root switch through which packets will be forwarded to the root.
- A port for each switch is selected. This is the port providing the best path from the switch to the root switch.
- Ports included in the STP are selected.

Creating a Stable STP Topology

It is to make the root port a fastest link. If all switches have STP enabled with default settings, the switch with the lowest MAC address in the network will become the root switch. By increasing the priority (lowering the priority number) of the best switch, STP can be forced to select the best switch as the root switch.

When STP is enabled using the default parameters, the path between source and destination stations in a switched network might not be ideal. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

STP Port States

The BPDUs take some time to pass through a network. This propagation delay can result in topology changes where a port that transitioned directly from a Blocking state to a Forwarding state could create temporary data loops. Ports must wait for new network topology information to propagate throughout the network before starting to forward packets. They must also wait for the packet lifetime to expire for BPDU packets that were forwarded based on the old topology. The forward delay timer is used to allow the network topology to stabilize after a topology change. In addition, STP specifies a series of states a port must transition through to further ensure that a stable network topology is created after a topology change.

Each port on a switch using STP exists in one of the following five states:

- **Blocking** – the port is blocked from forwarding or receiving packets
- **Listening** – the port is waiting to receive BPDU packets that may tell the port to go back to the blocking state
- **Learning** – the port is adding addresses to its forwarding database, but not yet forwarding packets
- **Forwarding** – the port is forwarding packets
- **Disabled** – the port only responds to network management messages and must return to the blocking state first

A port transitions from one state to another as follows:

- From initialization (switch boot) to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled
- From disabled to blocking

Figure 4-3-10-1-1: STP Port State Transitions

You can modify each port state by using management software. When you enable STP, every port on every switch in the network goes through the blocking state and then transitions through the states of listening and learning at power up. If properly configured, each port stabilizes to the forwarding or blocking state. No packets (except BPDUs) are forwarded from, or received by, STP enabled ports until the forwarding state is enabled for that port.

2. STP Parameters

STP Operation Levels

The Switch allows for two levels of operation: the switch level and the port level. The switch level forms a spanning tree consisting of links between one or more switches. The port level constructs a spanning tree consisting of groups of one or more ports. The STP operates in much the same way for both levels.

 Note	<p>On the switch level, STP calculates the Bridge Identifier for each switch and then sets the Root Bridge and the Designated Bridges.</p> <p>On the port level, STP sets the Root Port and the Designated Ports.</p>
----------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The following are the user-configurable STP parameters for the switch level:

Parameter	Description	Default Value
Bridge Identifier(Not user configurable except by setting priority below)	A combination of the User-set priority and the switch's MAC address. The Bridge Identifier consists of two parts: a 16-bit priority and a 48-bit Ethernet MAC address 32768 + MAC	32768 + MAC
Priority	A relative priority for each switch – lower numbers give a higher priority and a greater chance of a given switch being elected as the root bridge	32768
Hello Time	The length of time between broadcasts of the hello message by the switch	2 seconds
Maximum Age Timer	Measures the age of a received BPDU for a port and ensures that the BPDU is discarded when its age exceeds the value of the maximum age timer.	20 seconds
Forward Delay Timer	The amount time spent by a port in the learning and listening states waiting for a BPDU that may return the port to the blocking state.	15 seconds

The following are the user-configurable STP parameters for the port or port group level:

Variable	Description	Default Value
Port Priority	A relative priority for each port –lower numbers give a higher priority and a greater chance of a given port being elected as the root port	128
Port Cost	A value used by STP to evaluate paths – STP calculates path costs and selects the path with the minimum cost as the active path	200,000-100Mbps Fast Ethernet ports 20,000-1000Mbps Gigabit Ethernet ports 0 - Auto

Default Spanning-Tree Configuration

Feature	Default Value
Enable state	STP disabled for all ports
Port priority	128
Port cost	0
Bridge Priority	32,768

User-Changeable STA Parameters

The Switch's factory default setting should cover the majority of installations. However, it is advisable to keep the default settings as set at the factory; unless, it is absolutely necessary. The user changeable parameters in the Switch are as follows:

Priority – A Priority for the switch can be set from 0 to 65535. 0 is equal to the highest Priority.

Hello Time – The Hello Time can be from 1 to 10 seconds. This is the interval between two transmissions of BPDU packets sent by the Root Bridge to tell all other Switches that it is indeed the Root Bridge. If you set a Hello Time for your Switch, and it is not the Root Bridge, the set Hello Time will be used if and when your Switch becomes the Root Bridge.

The Hello Time cannot be longer than the Max. Age; otherwise, a configuration error will occur.

Max. Age – The Max Age can be from 6 to 40 seconds. At the end of the Max Age, if a BPDU has still not been received from the Root Bridge, your Switch will start sending its own BPDU to all other Switches for permission to become the Root Bridge. If it turns out that your Switch has the lowest Bridge Identifier, it will become the Root Bridge.

Forward Delay Timer – The Forward Delay can be from 4 to 30 seconds. This is the time any port on the Switch spends in the listening state while moving from the blocking state to the forwarding state.

Observe the following formulas when setting the above parameters:

Max. Age _ 2 x (Forward Delay - 1 second)

Max. Age _ 2 x (Hello Time + 1 second)

Port Priority – A Port Priority can be from 0 to 240. The lower the number, the greater the probability the port will be chosen as the Root Port.

Port Cost – A Port Cost can be set from 0 to 200000000. The lower the number, the greater the probability the port will be chosen to forward packets.

3. Illustration of STP

A simple illustration of three switches connected in a loop is depicted in the below diagram. In this example, you can anticipate some major network problems if the STP assistance is not applied.

If switch A broadcasts a packet to switch B, switch B will broadcast it to switch C, and switch C will broadcast it to back to switch A and so on. The broadcast packet will be passed indefinitely in a loop, potentially causing a network failure. In this example, STP breaks the loop by blocking the connection between switch B and C. The decision to block a particular connection is based on the STP calculation of the most current Bridge and Port settings.

Now, if switch A broadcasts a packet to switch C, then switch C will drop the packet at port 2 and the broadcast will end there. Setting-up STP using values other than the defaults, can be complex. Therefore, you are advised to keep the default factory settings and STP will automatically assign root bridges/ports and block loop connections. Influencing STP to choose a particular switch as the root bridge using the Priority setting, or influencing STP to choose a particular port to block using the Port Priority and Port Cost settings is, however, relatively straight forward.

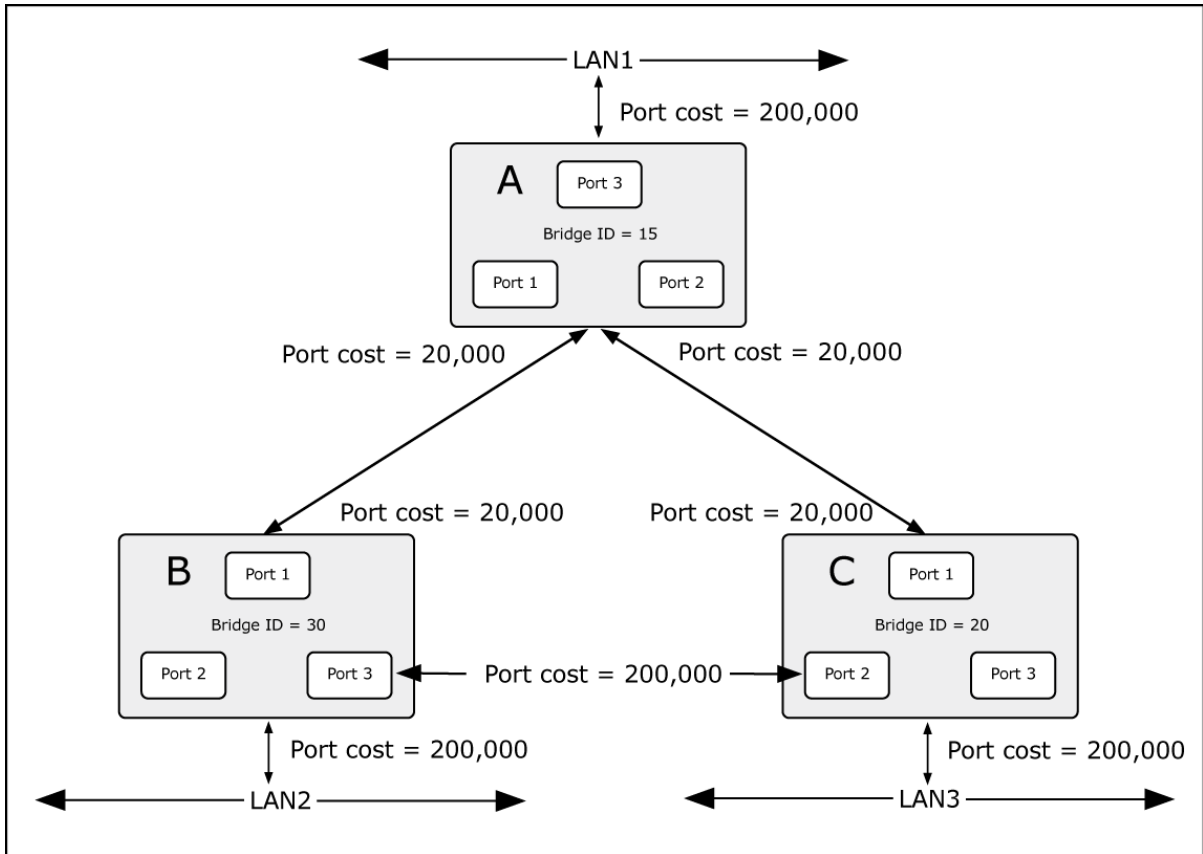

Figure 4-3-10-1-2: Before Applying the STA Rules

In this example, only the default STP values are used.

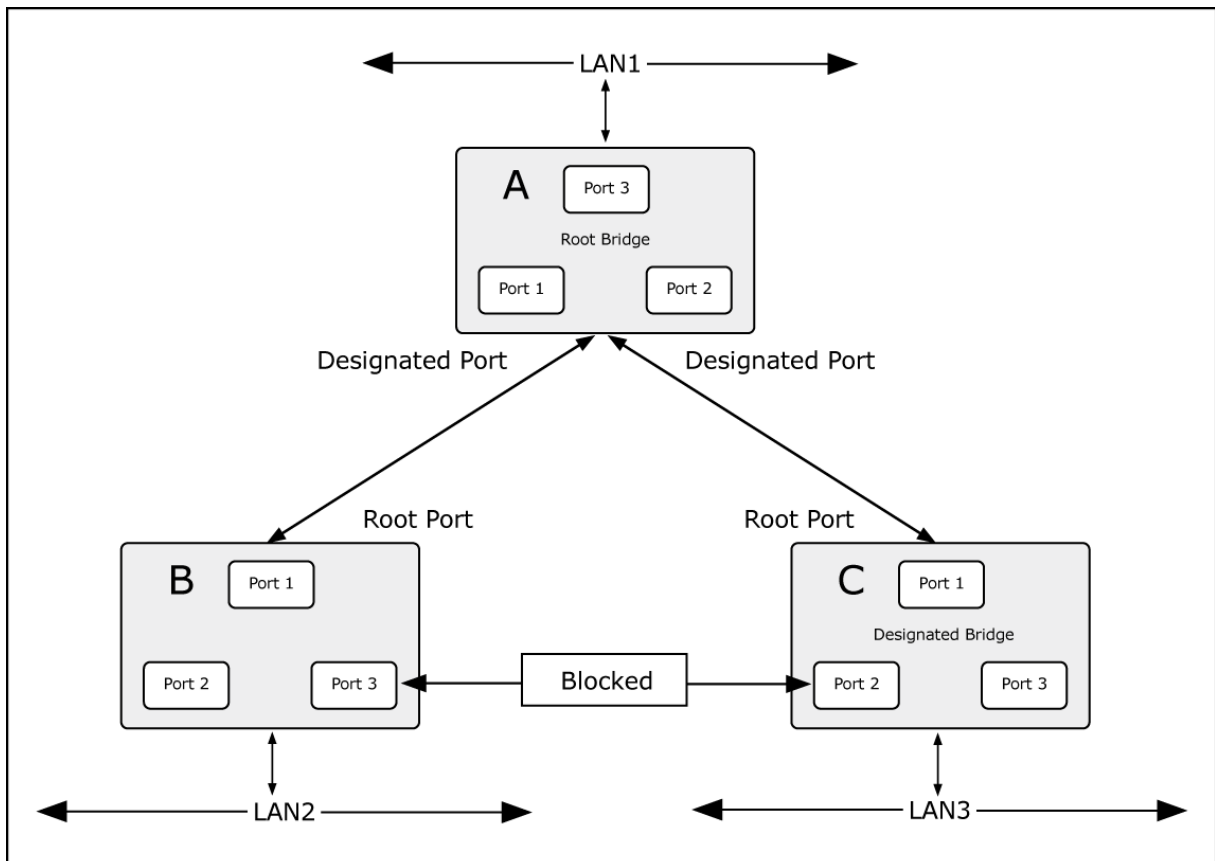

Figure 4-3-10-1-3: After Applying the STA Rules

The switch with the lowest Bridge ID (switch C) was elected the root bridge, and the ports were selected to give a high port cost between switches B and C. The two (optional) Gigabit ports (default port cost = 20,000) on switch A are connected to one (optional) Gigabit port on both switch B and C. The redundant link between switch B and C is deliberately chosen as a 100 Mbps Fast Ethernet link (default port cost = 200,000). Gigabit ports could be used, but the port cost should be increased from the default to ensure that the link between switch B and switch C is the blocked link.

4.3.10.2 System Configuration

This page allows you to configure STP system settings. The settings are used by all STP Bridge instances in the Switch. The Managed Switch support the following Spanning Tree protocols:

- **Compatible -- Spanning Tree Protocol (STP):** Provides a single path between end stations, avoiding and eliminating loops.
- **Normal -- Rapid Spanning Tree Protocol (RSTP) :** Detects and uses of network topologies that provide faster spanning tree convergence, without creating forwarding loops.
- **Extension – Multiple Spanning Tree Protocol (MSTP) :** Defines an extension to RSTP to further develop the usefulness of virtual LANs (VLANs). This "Per-VLAN" Multiple Spanning Tree Protocol configures a separate Spanning Tree for each VLAN group and blocks all but one of the possible alternate paths within each Spanning Tree.

The STP System Configuration screen in [Figure 4-3-10-2](#) appears.

4.3.10.4 CIST Port Configuration

This page allows the user to inspect the current STP CIST port configurations, and possibly change them as well. The CIST Port Configuration screen in [Figure 4-3-10-4-1](#) appears.

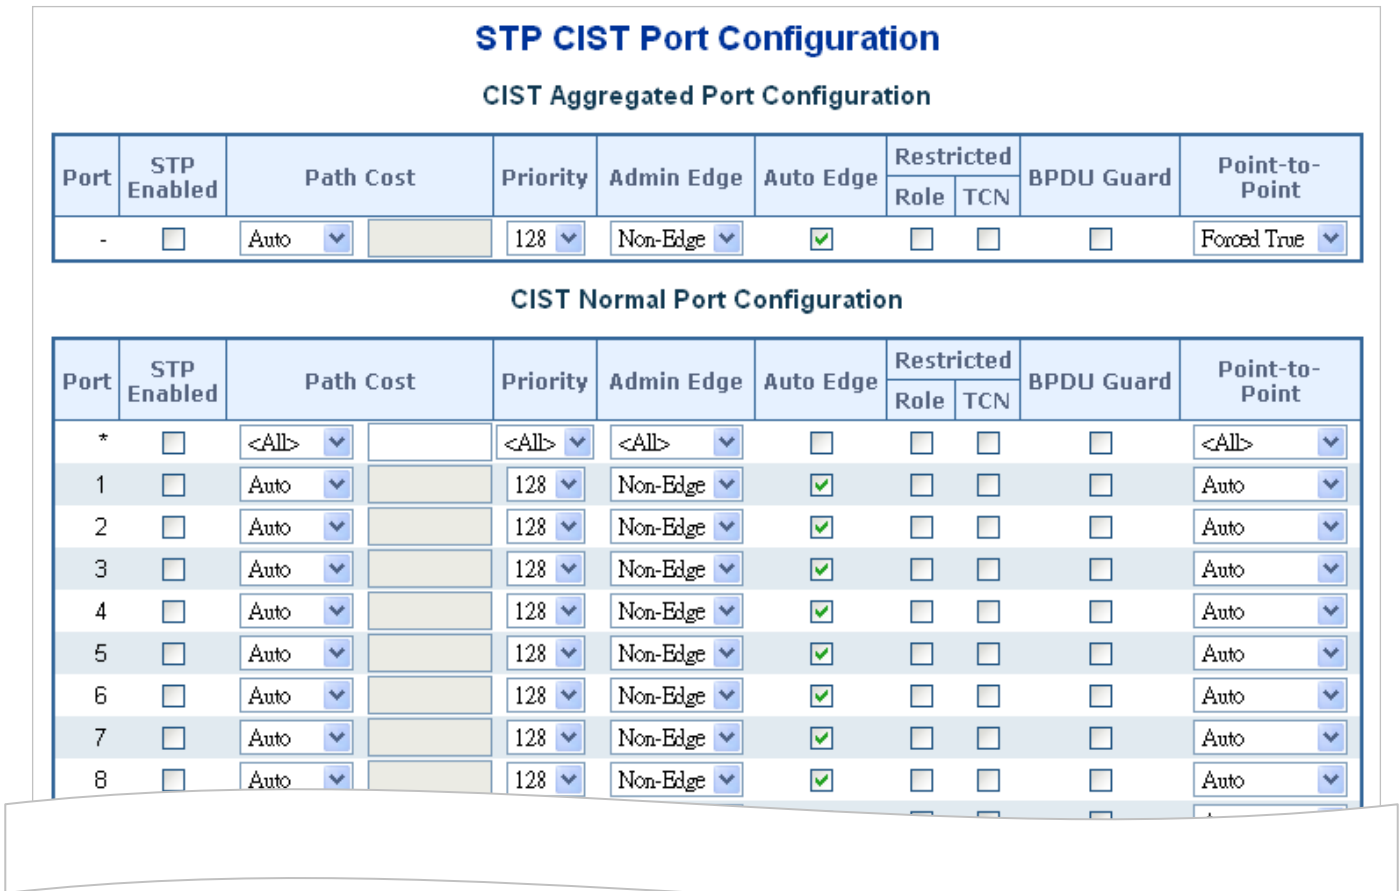

Figure 4-3-10-4-1: STP CIST Port Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number of the logical STP port.
• STP Enabled	Controls whether RSTP is enabled on this switch port.
• Path Cost	Controls the path cost incurred by the port. The Auto setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the Specific setting, a user-defined value can be entered. The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports. Valid values are in the range 1 to 200000000.
• Priority	Controls the port priority. This can be used to control priority of ports having identical port cost. (See above). Default: 128 Range: 0-240, in steps of 16
• AdminEdge	Controls whether the operEdge flag should start as being set or cleared. (The initial operEdge state when a port is initialized).

<ul style="list-style-type: none"> • AutoEdge 	<p>Controls whether the bridge should enable automatic edge detection on the bridge port. This allows operEdge to be derived from whether BPDU's are received on the port or not.</p>
<ul style="list-style-type: none"> • Restricted Role 	<p>If enabled, causes the port not to be selected as Root Port for the CIST or any MSTI, even if it has the best spanning tree priority vector. Such a port will be selected as an Alternate Port after the Root Port has been selected. If set, it can cause lack of spanning tree connectivity. It can be set by a network administrator to prevent bridges external to a core region of the network influence the spanning tree active topology, possibly because those bridges are not under the full control of the administrator. This feature is also known as Root Guard.</p>
<ul style="list-style-type: none"> • Restricted TCN 	<p>If enabled, causes the port not to propagate received topology change notifications and topology changes to other ports. If set it can cause temporary loss of connectivity after changes in a spanning tree's active topology as a result of persistently incorrect learned station location information. It is set by a network administrator to prevent bridges external to a core region of the network, causing address flushing in that region, possibly because those bridges are not under the full control of the administrator or the physical link state of the attached LANs transits frequently.</p>
<ul style="list-style-type: none"> • BPDU Guard 	<p>If enabled, causes the port to disable itself upon receiving valid BPDU's. Contrary to the similar bridge setting, the port Edge status does not effect this setting. A port entering error-disabled state due to this setting is subject to the bridge Port Error Recovery setting as well.</p>
<ul style="list-style-type: none"> • Point-to-point 	<p>Controls whether the port connects to a point-to-point LAN rather than a shared medium. This can be automatically determined, or forced either true or false. Transitions to the forwarding state is faster for point-to-point LANs than for shared media.</p>

By default, the system automatically detects the speed and duplex mode used on each port, and configures the path cost according to the values shown below. Path cost "0" is used to indicate auto-configuration mode. When the short path cost method is selected and the default path cost recommended by the IEEE 8021w standard exceeds 65,535, the default is set to 65,535.

Port Type	IEEE 802.1D-1998	IEEE 802.1w-2001
Ethernet	50-600	200,000-20,000,000
Fast Ethernet	10-60	20,000-2,000,000
Gigabit Ethernet	3-10	2,000-200,000

Table 4-3-10-4-2: Recommended STP Path Cost Range

Port Type	Link Type	IEEE 802.1D-1998	IEEE 802.1w-2001
Ethernet	Half Duplex	100	2,000,000
	Full Duplex	95	1,999,999
	Trunk	90	1,000,000
Fast Ethernet	Half Duplex	19	200,000
	Full Duplex	18	100,000
	Trunk	15	50,000
Gigabit Ethernet	Full Duplex	4	10,000
	Trunk	3	5,000

4.3.11 IGMP Snooping

The **Internet Group Management Protocol (IGMP)** lets host and routers share information about multicast groups memberships. IGMP snooping is a switch feature that monitors the exchange of IGMP messages and copies them to the CPU for feature processing. The overall purpose of IGMP Snooping is to limit the forwarding of multicast frames to only ports that are a member of the multicast group.

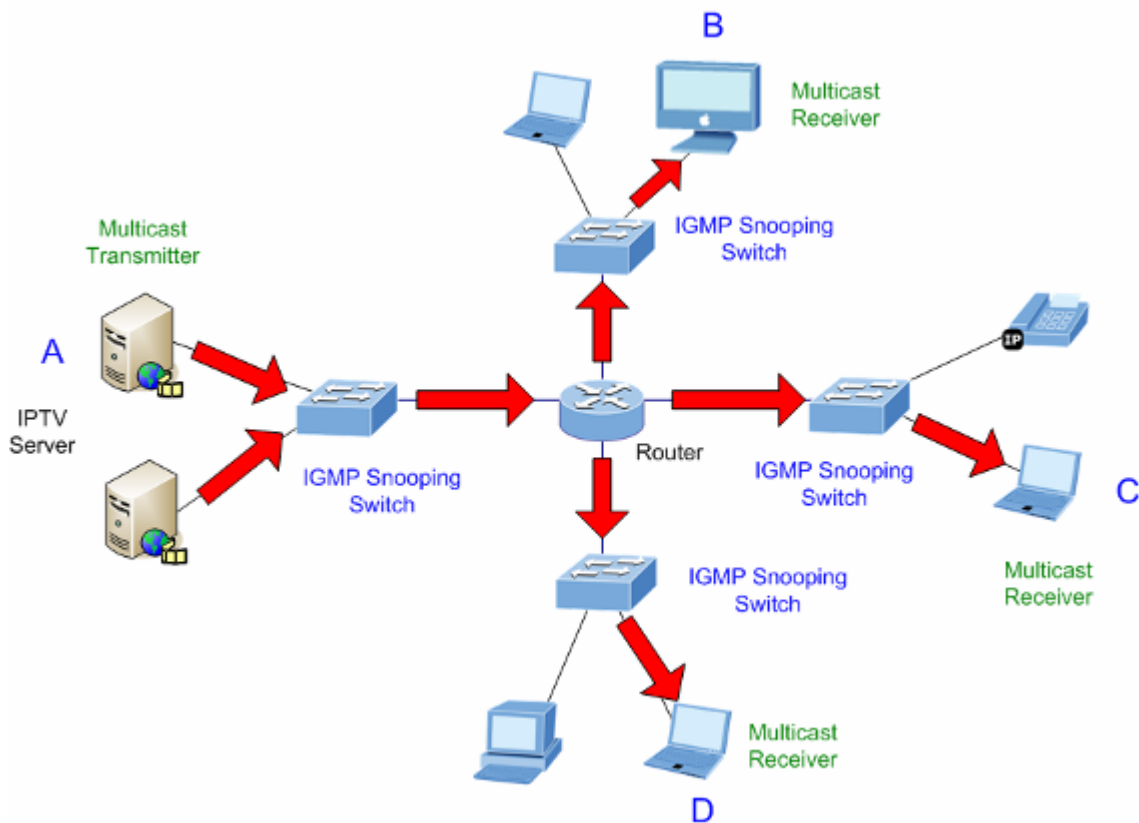

About the Internet Group Management Protocol (IGMP) Snooping

Computers and network devices that want to receive multicast transmissions need to inform nearby routers that they will become members of a multicast group. The **Internet Group Management Protocol (IGMP)** is used to communicate this information. IGMP is also used to periodically check the multicast group for members that are no longer active. In the case where there is more than one multicast router on a sub network, one router is elected as the 'queried'. This router then keeps track of the membership of the multicast groups that have active members. The information received from IGMP is then used to determine if multicast packets should be forwarded to a given sub network or not. The router can check, using IGMP, to see if there is at least one member of a multicast group on a given subnet work. If there are no members on a sub network, packets will not be forwarded to that sub network.

Multicast Flooding

IGMP Snooping Multicast Stream Control

IGMP Versions 1 and 2

Multicast groups allow members to join or leave at any time. IGMP provides the method for members and multicast routers to communicate when joining or leaving a multicast group. IGMP version 1 is defined in RFC 1112. It has a fixed packet size and no optional data. The format of an IGMP packet is shown below:

IGMP Message Format

Octets

The IGMP Type codes are shown below:

Type	Meaning
0x11	Membership Query (if Group Address is 0.0.0.0)
0x11	Specific Group Membership Query (if Group Address is Present)
0x16	Membership Report (version 2)
0x17	Leave a Group (version 2)
0x12	Membership Report (version 1)

IGMP packets enable multicast routers to keep track of the membership of multicast groups, on their respective sub networks.

The following outlines what is communicated between a multicast router and a multicast group member using IGMP.

A host sends an IGMP “**report**” to join a group

A host will never send a report when it wants to leave a group (for version 1).

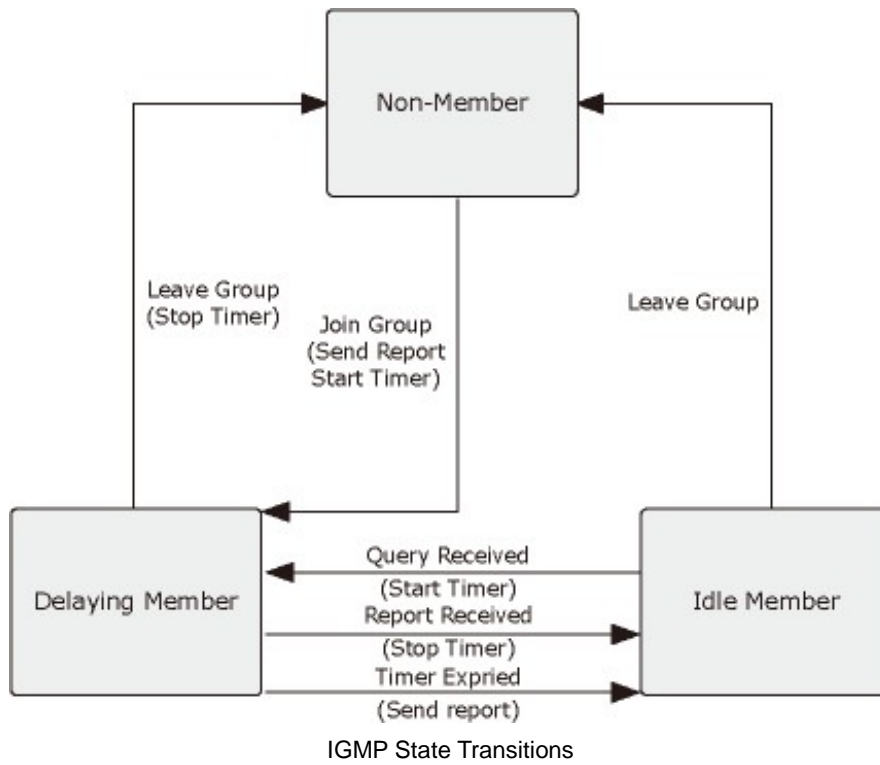

A host will send a “**leave**” report when it wants to leave a group (for version 2).

Multicast routers send IGMP queries (to the all-hosts group address: 224.0.0.1) periodically to see whether any group members exist on their sub networks. If there is no response from a particular group, the router assumes that there are no group members on the network.

The Time-to-Live (TTL) field of query messages is set to 1 so that the queries will not be forwarded to other sub networks.

IGMP version 2 introduces some enhancements such as a method to elect a multicast queried for each LAN, an explicit leave message, and query messages that are specific to a given group.

The states a computer will go through to join or to leave a multicast group are shown below:

■ **IGMP Querier**

A router, or multicast-enabled switch, can periodically ask their hosts if they want to receive multicast traffic. If there is more than one router/switch on the LAN performing IP multicasting, one of these devices is elected “**querier**” and assumes the role of querying the LAN for group members. It then propagates the service requests on to any upstream multicast switch/router to ensure that it will continue to receive the multicast service.

 Note

Multicast routers use this information, along with a multicast routing protocol such as DVMRP or PIM, to support IP multicasting across the Internet.

4.3.11.1 Profile Table

This page provides IPMC Profile related configurations. The IPMC profile is used to deploy the access control on IP multicast streams. It is allowed to create at maximum 64 Profiles with at maximum 128 corresponding rules for each. The Profile Table screen in Figure 4-3-11-1 appears.

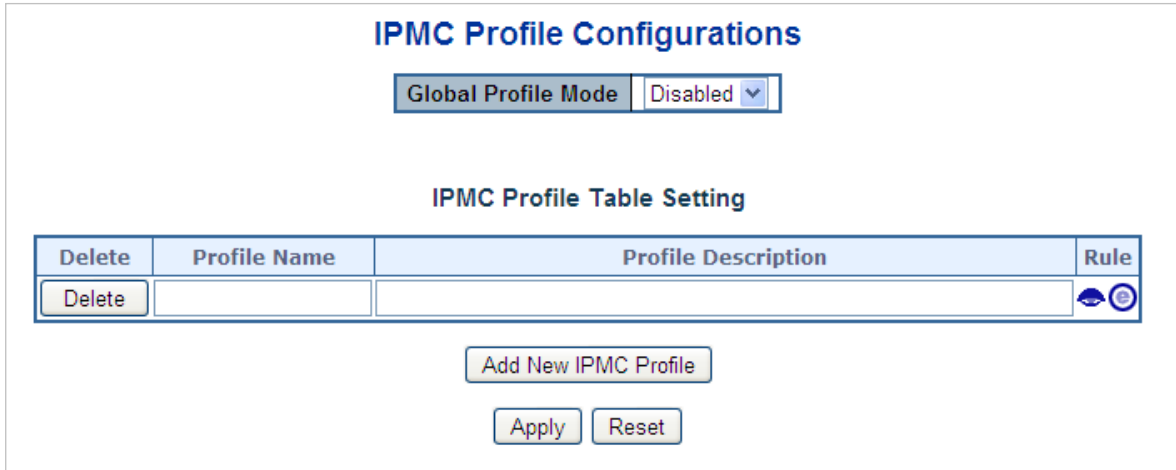

Figure 4-3-11-1: IPMC Profile Configuration Page

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Global Profile Mode 	<p>Enable/Disable the Global IPMC Profile.</p> <p>System starts to do filtering based on profile settings only when the global profile mode is enabled.</p>
<ul style="list-style-type: none"> • Delete 	<p>Check to delete the entry.</p> <p>The designated entry will be deleted during the next save.</p>
<ul style="list-style-type: none"> • Profile Name 	<p>The name used for indexing the profile table.</p> <p>Each entry has the unique name which is composed of at maximum 16 alphabetic and numeric characters. At least one alphabet must be present.</p>
<ul style="list-style-type: none"> • Profile Description 	<p>Additional description, which is composed of at maximum 64 alphabetic and numeric characters, about the profile.</p> <p>No blank or space characters are permitted as part of description. Use "_" or "-" to separate the description sentence.</p>
<ul style="list-style-type: none"> • Rule 	<p>When the profile is created, click the edit button to enter the rule setting page of the designated profile. Summary about the designated profile will be shown by clicking the view button. You can manage or inspect the rules of the designated profile by using the following buttons:</p> <p>: List the rules associated with the designated profile.</p> <p>: Adjust the rules associated with the designated profile.</p>

Buttons

: Click to add new IPMC profile. Specify the name and configure the new entry. Click "Save".

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.11.2 Address Entry

This page provides address range settings used in IPMC profile. The address entry is used to specify the address range that will be associated with IPMC Profile. It is allowed to create at maximum 128 address entries in the system. The Profile Table screen in Figure 4-3-11-2 appears.

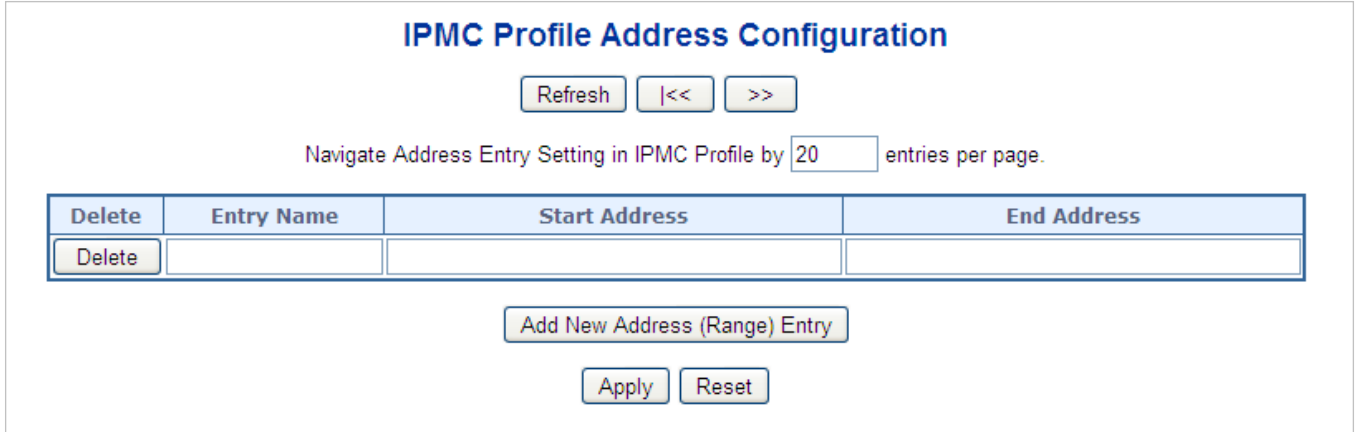

Figure 4-3-11-2: IPMC Profile Address Configuration Page

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	<p>Check to delete the entry.</p> <p>The designated entry will be deleted during the next save.</p>
<ul style="list-style-type: none"> • Entry Name 	<p>The name used for indexing the address entry table.</p> <p>Each entry has the unique name which is composed of at maximum 16 alphabetic and numeric characters. At least one alphabet must be present.</p>
<ul style="list-style-type: none"> • Start Address 	<p>The starting IPv4/IPv6 Multicast Group Address that will be used as an address range.</p>
<ul style="list-style-type: none"> • End Address 	<p>The ending IPv4/IPv6 Multicast Group Address that will be used as an address range.</p>

Buttons

Add New Address (Range) Entry: Click to add new address range. Specify the name and configure the addresses. Click "Save".

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

Refresh: Refreshes the displayed table starting from the input fields.

<<: Updates the table starting from the first entry in the IPMC Profile Address Configuration.

>>: Updates the table, starting with the entry after the last entry currently displayed.

4.3.11.3 IGMP Snooping Configuration

This page provides IGMP Snooping related configuration. The IGMP Snooping Configuration screen in [Figure 4-3-11-3](#) appears.

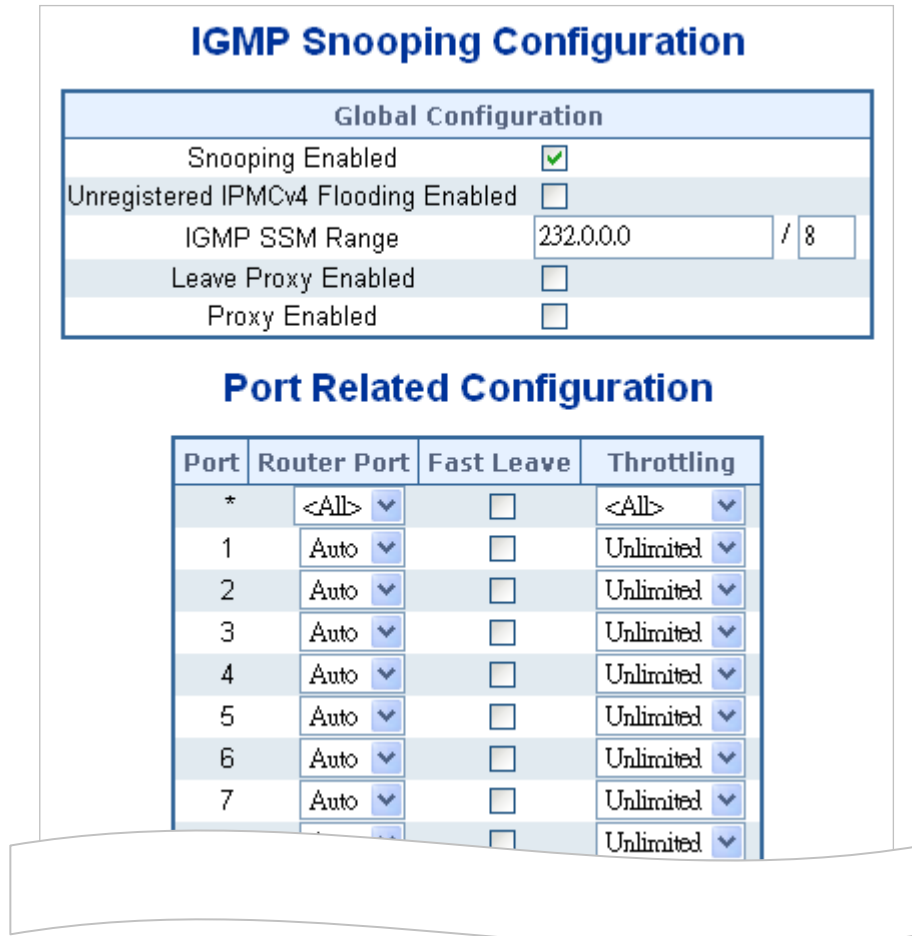

Figure 4-3-11-3: IGMP Snooping Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Snooping Enabled	Enable the Global IGMP Snooping.
• Unregistered IPMCv4 Flooding Enabled	Enable unregistered IPMCv4 traffic flooding. The flooding control takes effect only when IGMP Snooping is enabled. When IGMP Snooping is disabled, unregistered IPMCv4 traffic flooding is always active in spite of this setting.
• IGMP SSM Range	SSM (Source-Specific Multicast) Range allows the SSM-aware hosts and routers run the SSM service model for the groups in the address range.
• Leave Proxy Enable	Enable IGMP Leave Proxy. This feature can be used to avoid forwarding unnecessary leave messages to the router side.
• Proxy Enable	Enable IGMP Proxy. This feature can be used to avoid forwarding unnecessary join and leave messages to the router side.

<ul style="list-style-type: none"> • Router Port 	<p>Specify which ports act as IGMP router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier. The Switch forwards IGMP join or leave packets to an IGMP router port.</p> <ul style="list-style-type: none"> ■ Auto: Select "Auto" to have the Managed Switch automatically uses the port as IGMP Router port if the port receives IGMP query packets. ■ Fix: The Managed Switch always uses the specified port as an IGMP Router port. Use this mode when you connect an IGMP multicast server or IP camera which applied with multicast protocol to the port. ■ None: The Managed Switch will not use the specified port as an IGMP Router port. The Managed Switch will not keep any record of an IGMP router being connected to this port. Use this mode when you connect other IGMP multicast servers directly on the non-querier Managed Switch and don't want the multicast stream to be flooded by uplinking switch through the port that is connected to the IGMP querier.
<ul style="list-style-type: none"> • Fast Leave 	<p>Enable the fast leave on the port.</p>
<ul style="list-style-type: none"> • Throtting 	<p>Enable to limit the number of multicast groups to which a switch port can belong.</p>

Buttons

 : Click to apply changes

 : Click to undo any changes made locally and revert to previously saved values.

4.3.11.4 IGMP Snooping VLAN Configuration

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. The IGMP Snooping VLAN Configuration screen in [Figure 4-3-11-4](#) appears.

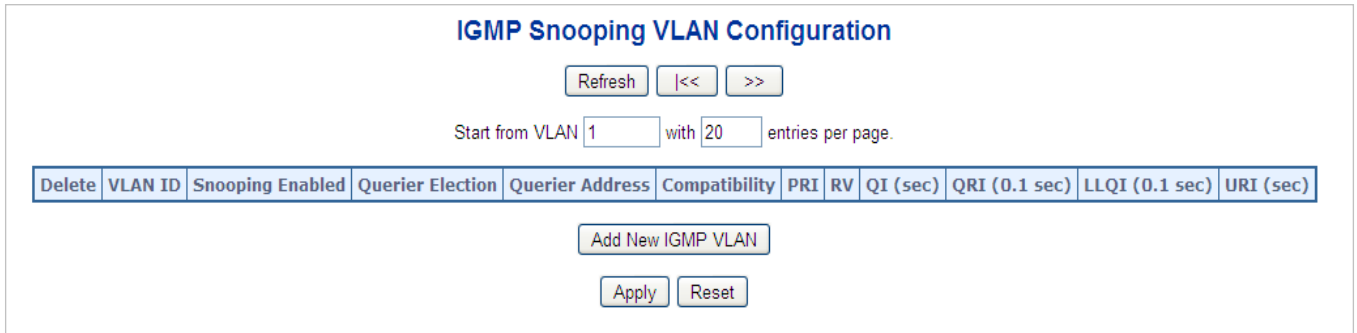

Figure 4-3-11-4: IGMP Snooping VLAN Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. The designated entry will be deleted during the next save.
• VLAN ID	The VLAN ID of the entry.
• IGMP Snooping Enable	Enable the per-VLAN IGMP Snooping. Only up to 32 VLANs can be selected.
• Querier Election	Enable the IGMP Querier election in the VLAN. Disable to act as an IGMP Non-Querier.
• Querier Address	Define the IPv4 address as source address used in IP header for IGMP Querier election. <ul style="list-style-type: none"> ■ When the Querier address is not set, system uses IPv4 management address of the IP interface associated with this VLAN. ■ When the IPv4 management address is not set, system uses the first available IPv4 management address. Otherwise, system uses a pre-defined value. By default, this value will be 192.0.2.1
• Compatibility	Compatibility is maintained by hosts and routers taking appropriate actions depending on the versions of IGMP operating on hosts and routers within a network. The allowed selection is IGMP-Auto , Forced IGMPv1 , Forced IGMPv2 , Forced IGMPv3 . Default compatibility value is IGMP-Auto .

<ul style="list-style-type: none"> • PRI 	<p>(PRI) Priority of Interface. It indicates the IGMP control frame priority level generated by the system. These values can be used to prioritize different classes of traffic.</p> <p>The allowed range is 0 (best effort) to 7 (highest), default interface priority value is 0</p>
<ul style="list-style-type: none"> • RV 	<p>Robustness Variable. The Robustness Variable allows tuning for the expected packet loss on a network.</p> <p>The allowed range is 1 to 255, default robustness variable value is 2.</p>
<ul style="list-style-type: none"> • QI 	<p>Query Interval. The Query Interval is the interval between General Queries sent by the Querier. The allowed range is 1 to 31744 seconds, default query interval is 125 seconds.</p>
<ul style="list-style-type: none"> • QRI 	<p>Query Response Interval. The Max Response Time used to calculate the Max Resp Code inserted into the periodic General Queries.</p> <p>The allowed range is 0 to 31744 in tenths of seconds, default query response interval is 100 in tenths of seconds (10 seconds).</p>
<ul style="list-style-type: none"> • LLQI (LMQI for IGMP) 	<p>Last Member Query Interval. The Last Member Query Time is the time value represented by the Last Member Query Interval, multiplied by the Last Member Query Count.</p> <p>The allowed range is 0 to 31744 in tenths of seconds, default last member query interval is 10 in tenths of seconds (1 second).</p>
<ul style="list-style-type: none"> • URI 	<p>Unsolicited Report Interval. The Unsolicited Report Interval is the time between repetitions of a host's initial report of membership in a group.</p> <p>The allowed range is 0 to 31744 seconds, default unsolicited report interval is 1 second.</p>

Buttons

: Refreshes the displayed table starting from the "VLAN" input fields.

: Updates the table starting from the first entry in the VLAN Table, i.e. the entry with the lowest VLAN ID.

: Updates the table, starting with the entry after the last entry currently displayed.

: Click to add new IGMP VLAN. Specify the VID and configure the new entry.

Click "Save". The specific IGMP VLAN starts working after the corresponding static VLAN is also created.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.11.5 IGMP Snooping Port Group Filtering

In certain switch applications, the administrator may want to control the multicast services that are available to end users. For example, an IP/TV service based on a specific subscription plan. The IGMP filtering feature fulfills this requirement by restricting access to specified multicast services on a switch port, and IGMP throttling limits the number of simultaneous multicast groups a port can join.

IGMP filtering enables you to assign a profile to a switch port that specifies multicast groups that are permitted or denied on the port. An IGMP filter profile can contain one or more, or a range of multicast addresses; but only one profile can be assigned to a port. When enabled, IGMP join reports received on the port are checked against the filter profile. If a requested multicast group is permitted, the IGMP join report is forwarded as normal. If a requested multicast group is denied, the IGMP join report is dropped.

IGMP throttling sets a maximum number of multicast groups that a port can join at the same time. When the maximum number of groups is reached on a port, the switch can take one of two actions; either "deny" or "replace". If the action is set to deny, any new IGMP join reports will be dropped. If the action is set to replace, the switch randomly removes an existing group and replaces it with the new multicast group. The IGMP Snooping Port Group Filtering Configuration screen in [Figure 4-3-11-5](#) appears.

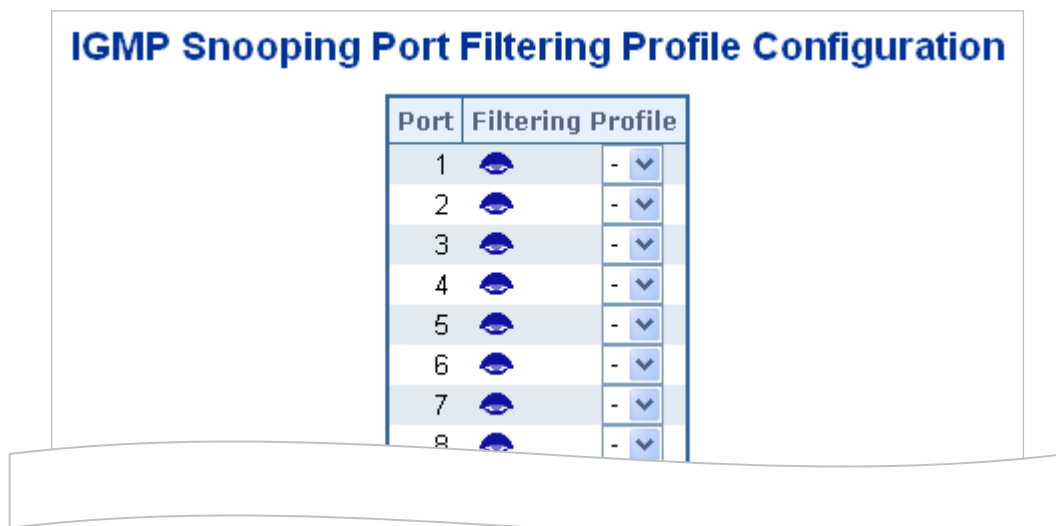

Figure 4-3-11-5: IGMP Snooping Port Filtering Profile Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port 	The logical port for the settings.
<ul style="list-style-type: none"> • Filtering Profile 	Select the IPMC Profile as the filtering condition for the specific port. Summary about the designated profile will be shown by clicking the view button

Buttons

Figure 4-3-12-1: MLD Snooping Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Snooping Enabled	Enable the Global MLD Snooping.
• Unregistered IPMCv6 Flooding enabled	Enable unregistered IPMCv6 traffic flooding. The flooding control takes effect only when MLD Snooping is enabled. When MLD Snooping is disabled, unregistered IPMCv6 traffic flooding is always active in spite of this setting.
• MLD SSM Range	SSM (Source-Specific Multicast) Range allows the SSM-aware hosts and routers run the SSM service model for the groups in the address range.
• Leave Proxy Enable	Enable MLD Leave Proxy. This feature can be used to avoid forwarding unnecessary leave messages to the router side.
• Proxy Enable	Enable MLD Proxy. This feature can be used to avoid forwarding unnecessary join and leave messages to the router side.
• Router Port	Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier. If an aggregation member port is selected as a router port, the whole aggregation will act as a router port. The allowed selection is Auto, Fix, Fone , default compatibility value is Auto.
• Fast Leave	Enable the fast leave on the port.
• Throtting	Enable to limit the number of multicast groups to which a switch port can belong.

4.3.12.2 MLD Snooping VLAN Configuration

Each page shows up to 99 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. The MLD Snooping VLAN Configuration screen in [Figure 4-3-12-2](#) appears.

Figure 4-3-12-2: IGMP Snooping VLAN Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. The designated entry will be deleted during the next save.
• VLAN ID	The VLAN ID of the entry.
• MLD Snooping Enable	Enable the per-VLAN MLD Snooping. Up to 32 VLANs can be selected for MLD Snooping.
• Querier Election	Enable to join MLD Querier election in the VLAN. Disable to act as a MLD Non-Querier.
• Compatibility	Compatibility is maintained by hosts and routers taking appropriate actions depending on the versions of MLD operating on hosts and routers within a network. The allowed selection is MLD-Auto , Forced MLDv1 , Forced MLDv2 , default compatibility value is MLD-Auto.
• PRI	(PRI) Priority of Interface. It indicates the MLD control frame priority level generated by the system. These values can be used to prioritize different classes of traffic. The allowed range is 0 (best effort) to 7 (highest), default interface priority value is 0
• RV	Robustness Variable. The Robustness Variable allows tuning for the expected packet loss on a network. The allowed range is 1 to 255 , default robustness variable value is 2 .

<ul style="list-style-type: none"> • QI 	<p>Query Interval. The Query Interval is the interval between General Queries sent by the Querier. The allowed range is 1 to 31744 seconds, default query interval is 125 seconds.</p>
<ul style="list-style-type: none"> • QRI 	<p>Query Response Interval. The Max Response Time used to calculate the Max Resp Code inserted into the periodic General Queries. The allowed range is 0 to 31744 in tenths of seconds, default query response interval is 100 in tenths of seconds (10 seconds).</p>
<ul style="list-style-type: none"> • LLQI (LMQI for IGMP) 	<p>Last Member Query Interval. The Last Member Query Time is the time value represented by the Last Member Query Interval, multiplied by the Last Member Query Count. The allowed range is 0 to 31744 in tenths of seconds, default last member query interval is 10 in tenths of seconds (1 second).</p>
<ul style="list-style-type: none"> • URI 	<p>Unsolicited Report Interval. The Unsolicited Report Interval is the time between repetitions of a host's initial report of membership in a group. The allowed range is 0 to 31744 seconds, default unsolicited report interval is 1 second.</p>

Buttons

: Refreshes the displayed table starting from the "VLAN" input fields.

: Updates the table starting from the first entry in the VLAN Table, i.e. the entry with the lowest VLAN ID.

: Updates the table, starting with the entry after the last entry currently displayed.

: Click to add new MLD VLAN. Specify the VID and configure the new entry. Click "Save". The specific MLD VLAN starts working after the corresponding static VLAN is also created.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.12.3 MLD Snooping Port Group Filtering

In certain switch applications, the administrator may want to control the multicast services that are available to end users. For example, an IP/TV service based on a specific subscription plan. The MLD filtering feature fulfills this requirement by restricting access to specified multicast services on a switch port, and MLD throttling limits the number of simultaneous multicast groups a port can join.

MLD filtering enables you to assign a profile to a switch port that specifies multicast groups that are permitted or denied on the port. A MLD filter profile can contain one or more, or a range of multicast addresses; but only one profile can be assigned to a port. When enabled, MLD join reports received on the port are checked against the filter profile. If a requested multicast group is permitted, the MLD join report is forwarded as normal. If a requested multicast group is denied, the MLD join report is dropped.

MLD throttling sets a maximum number of multicast groups that a port can join at the same time. When the maximum number of groups is reached on a port, the switch can take one of two actions; either “deny” or “replace”. If the action is set to deny, any new MLD join reports will be dropped. If the action is set to replace, the switch randomly removes an existing group and replaces it with the new multicast group. The MLD Snooping Port Group Filtering Configuration screen in [Figure 4-3-12-3](#) appears.

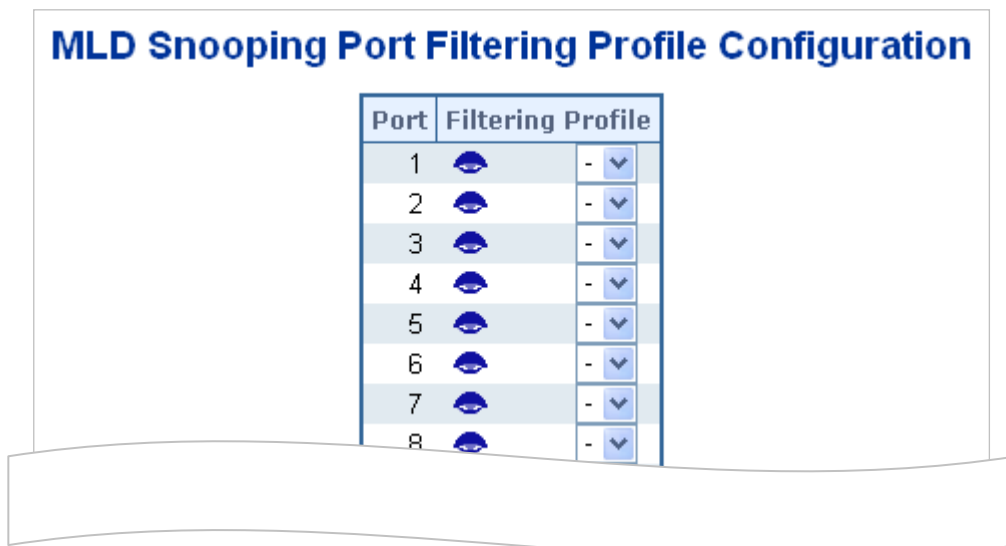

Figure 4-3-12-3: MLD Snooping Port Group Filtering Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings.
• Filtering Group	Select the IPMC Profile as the filtering condition for the specific port. Summary about the designated profile will be shown by clicking the view button.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.12.4 MLD Snooping Status

This page provides MLD Snooping status. The IGMP Snooping Status screen in [Figure 4-3-12-4](#) appears.

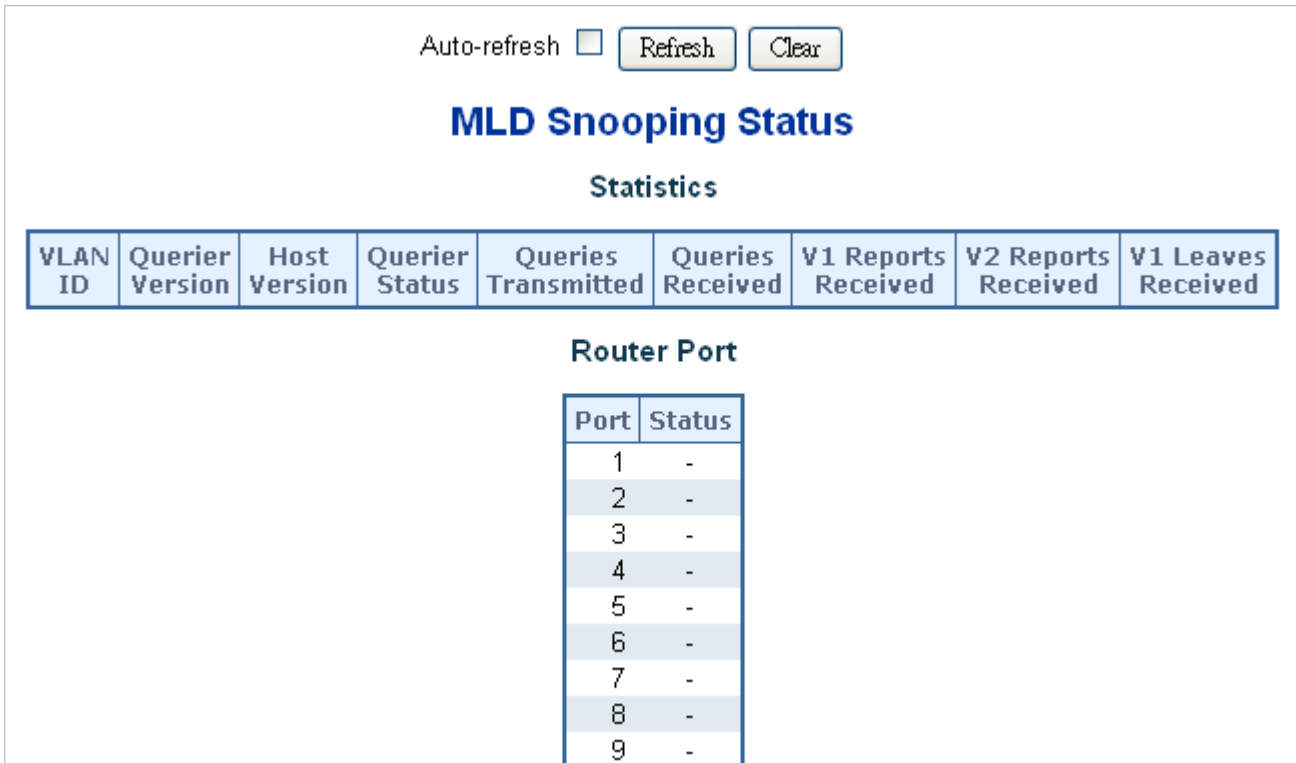

Figure 4-3-12-4: MLD Snooping Status Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	The VLAN ID of the entry.
• Querier Version	Working Querier Version currently.
• Host Version	Working Host Version currently.
• Querier Status	Shows the Querier status is "ACTIVE" or "IDLE". "DISABLE" denotes the specific interface is administratively disabled.
• Querier Transmitted	The number of Transmitted Querier.
• Querier Received	The number of Received Querier.
• V1 Reports Received	The number of Received V1 Reports.
• V2 Reports Received	The number of Received V2 Reports.
• V1 Leave Received	The number of Received V1 Leaves.
• Router Port	Display which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier. Static denotes the specific port is configured to be a router port. Dynamic denotes the specific port is learnt to be a router port. Both denote the specific port is configured or learnt to be a router port.
• Port	Switch port number.
• Status	Indicates whether specific port is a router port or not.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Automatic refresh occurs every 3 seconds.

4.3.12.5 MLD Group Information

Entries in the MLD Group Table are shown on this page. The MLD Group Table is sorted first by VLAN ID, and then by group. Each page shows up to 99 entries from the MLD Group table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MLD Group Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MLD Group Table. The MLD Groups Information screen in [Figure 4-3-12-5](#) appears.

Figure 4-3-12-5: MLD Snooping Groups Information Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	VLAN ID of the group.
• Groups	Group address of the group displayed.
• Port Members	Ports under this group.

Buttons

Auto-refresh : Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

: Updates the table, starting with the first entry in the IGMP Group Table.

: Updates the table, starting with the entry after the last entry currently displayed.

4.3.12.6 MLDv2 Information

Entries in the MLD SFM Information Table are shown on this page. The MLD SFM (Source-Filtered Multicast) Information Table also contains the SSM (Source-Specific Multicast) information. This table is sorted first by VLAN ID, then by group, and then by Port. Different source addresses belong to the same group are treated as single entry. Each page shows up to 99 entries from the MLD SFM Information table, default being 20, selected through the "entries per page" input field. When first visited, the web Page will show the first 20 entries from the beginning of the MLD SFM Information Table.

The "Start from VLAN", and "group" input fields allow the user to select the starting point in the MLD SFM Information Table. The MLDv2 Information screen in [Figure 4-3-12-6](#) appears.

Figure 4-3-12-6: MLD SSM Information Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	VLAN ID of the group.
• Group	Group address of the group displayed.
• Port	Switch port number.
• Mode	Indicates the filtering mode maintained per (VLAN ID, port number, Group Address) basis. It can be either Include or Exclude.
• Source Address	IP Address of the source. Currently, system limits the total number of IP source addresses for filtering to be 128.
• Type	Indicates the Type. It can be either Allow or Deny.
• Hardware Filter/Switch	Indicates whether data plane destined to the specific group address from the source IPv6 address could be handled by chip or not.

Buttons

Auto-refresh : Automatic refresh occurs every 3 seconds.

: Refreshes the displayed table starting from the input fields.

: Updates the table starting from the first entry in the MLD SFM Information Table.

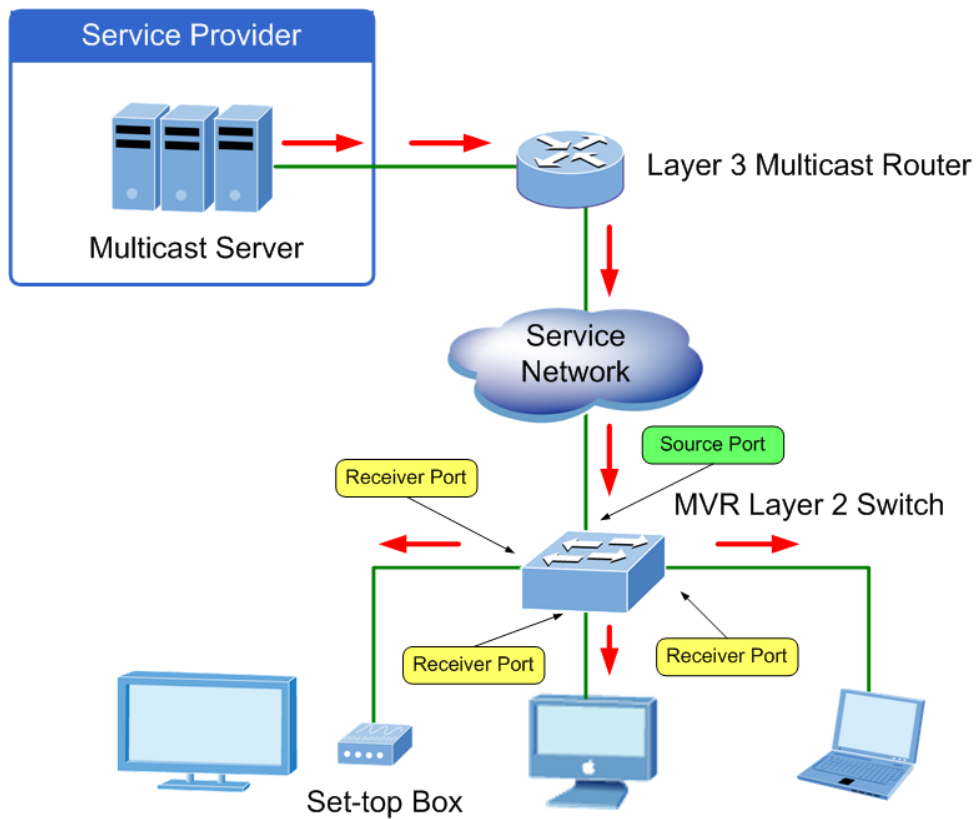

: Updates the table, starting with the entry after the last entry currently displayed.

4.3.13 MVR (Multicast VLAN Registration)

The MVR feature enables multicast traffic forwarding on the Multicast VLANs.

- In a multicast television application, a PC or a network television or a set-top box can receive the multicast stream.
- Multiple set-top boxes or PCs can be connected to one subscriber port, which is a switch port configured as an MVR receiver port. When a subscriber selects a channel, the set-top box or PC sends an IGMP/MLD report message to Switch A to join the appropriate multicast group address.
- Uplink ports that send and receive multicast data to and from the multicast VLAN are called MVR source ports.

It is allowed to create at maximum 8 MVR VLANs with corresponding channel settings for each Multicast VLAN. There will be totally at maximum 256 group addresses for channel settings.

This page provides MVR related configuration.

: Updates the table starting from the first entry in the MVR SFM Information Table.

4.3.14 LLDP

4.3.14.1 Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is used to discover basic information about neighboring devices on the local broadcast domain. LLDP is a Layer 2 protocol that uses periodic broadcasts to advertise information about the sending device. Advertised information is represented in **Type Length Value (TLV)** format according to the IEEE 802.1ab standard, and can include details such as device identification, capabilities and configuration settings. LLDP also defines how to store and maintain information gathered about the neighboring network nodes it discovers.

Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED) is an extension of LLDP intended for managing endpoint devices such as Voice over IP phones and network switches. The LLDP-MED TLVs advertise information such as network policy, power, inventory, and device location details. LLDP and LLDP-MED information can be used by SNMP applications to simplify troubleshooting, enhance network management, and maintain an accurate network topology.

4.3.14.2 LLDP Configuration

This page allows the user to inspect and configure the current LLDP port settings. The LLDP Configuration screen in [Figure 4-3-14-2](#) appears.

Figure 4-3-14-2: LLDP Configuration Page Screenshot

The page includes the following fields:

LLDP Parameters

Object	Description
<ul style="list-style-type: none"> Tx Interval 	<p>The switch is periodically transmitting LLDP frames to its neighbors for having the network discovery information up-to-date. The interval between each LLDP frame is determined by the Tx Interval value. Valid values are restricted to 5 - 32768 seconds.</p> <p>Default: 30 seconds</p> <p>This attribute must comply with the following rule: $(\text{Transmission Interval} * \text{Hold Time Multiplier}) \leq 65536$, and $\text{Transmission Interval} \geq (4 * \text{Delay Interval})$</p>
<ul style="list-style-type: none"> Tx Hold 	<p>Each LLDP frame contains information about how long the information in the LLDP frame shall be considered valid. The LLDP information valid period is set to Tx Hold multiplied by Tx Interval seconds. Valid values are restricted to 2 - 10 times.</p> <p>TTL in seconds is based on the following rule: $(\text{Transmission Interval} * \text{Holdtime Multiplier}) \leq 65536$. Therefore, the default TTL is $4 * 30 = 120$ seconds.</p>
<ul style="list-style-type: none"> Tx Delay 	<p>If some configuration is changed (e.g. the IP address) a new LLDP frame is transmitted, but the time between the LLDP frames will always be at least the value of Tx Delay seconds. Tx Delay cannot be larger than 1/4 of the Tx Interval value.</p> <p>Valid values are restricted to 1 - 8192 seconds.</p> <p>This attribute must comply with the rule: $(4 * \text{Delay Interval}) \leq \text{Transmission Interval}$</p>
<ul style="list-style-type: none"> Tx Reinit 	<p>When a port is disabled, LLDP is disabled or the switch is rebooted a LLDP shutdown frame is transmitted to the neighboring units, signaling that the LLDP information isn't valid anymore. Tx Reinit controls the amount of seconds between the shutdown frame and a new LLDP initialization. Valid values are restricted to 1 - 10 seconds.</p>

LLDP Port Configuration

The LLDP port settings relate to the switch, as reflected by the page header.

Object	Description
<ul style="list-style-type: none"> Port 	<p>The switch port number of the logical LLDP port.</p>
<ul style="list-style-type: none"> Mode 	<p>Select LLDP mode.</p> <ul style="list-style-type: none"> ■ Rx only The switch will not send out LLDP information, but LLDP information from neighbor units is analyzed. ■ Tx only The switch will drop LLDP information received from neighbors, but will send out LLDP information. ■ Disabled The switch will not send out LLDP information, and will drop LLDP information received from neighbors. ■ Enabled The switch will send out LLDP information, and will analyze LLDP information received from neighbors.

<ul style="list-style-type: none"> • CDP Aware 	<p>Select CDP awareness.</p> <p>The CDP operation is restricted to decoding incoming CDP frames (The switch doesn't transmit CDP frames). CDP frames are only decoded if LLDP on the port is enabled.</p> <p>Only CDP TLVs that can be mapped to a corresponding field in the LLDP neighbours' table are decoded. All other TLVs are discarded (Unrecognized CDP TLVs and discarded CDP frames are not shown in the LLDP statistics.). CDP TLVs are mapped onto LLDP neighbours' table as shown below.</p> <p>CDP TLV "Device ID" is mapped to the LLDP "Chassis ID" field.</p> <p>CDP TLV "Address" is mapped to the LLDP "Management Address" field. The CDP address TLV can contain multiple addresses, but only the first address is shown in the LLDP neighbours table.</p> <p>CDP TLV "Port ID" is mapped to the LLDP "Port ID" field.</p> <p>CDP TLV "Version and Platform" is mapped to the LLDP "System Description" field.</p> <p>Both the CDP and LLDP support "system capabilities", but the CDP capabilities cover capabilities that are not part of the LLDP. These capabilities are shown as "others" in the LLDP neighbours' table.</p> <p>If all ports have CDP awareness disabled the switch forwards CDP frames received from neighbour devices. If at least one port has CDP awareness enabled all CDP frames are terminated by the switch.</p> <p>Note: When CDP awareness on a port is disabled the CDP information isn't removed immediately, but gets removed when the hold time is exceeded.</p>
<ul style="list-style-type: none"> • Port Description 	<p>Optional TLV: When checked the "port description" is included in LLDP information transmitted.</p>
<ul style="list-style-type: none"> • System Name 	<p>Optional TLV: When checked the "system name" is included in LLDP information transmitted.</p>
<ul style="list-style-type: none"> • System Description 	<p>Optional TLV: When checked the "system description" is included in LLDP information transmitted.</p>
<ul style="list-style-type: none"> • System Capabilities 	<p>Optional TLV: When checked the "system capability" is included in LLDP information transmitted.</p>
<ul style="list-style-type: none"> • Management Address 	<p>Optional TLV: When checked the "management address" is included in LLDP information transmitted.</p>

4.3.14.3 LLDP Neighbor

This page provides a status overview for all LLDP neighbors. The displayed table contains a row for each port on which an LLDP neighbor is detected. The LLDP Neighbor Information screen in [Figure 4-3-14-3](#) appears.

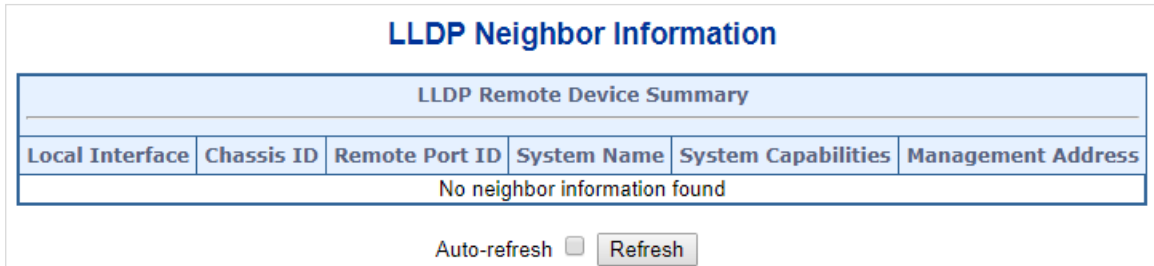

Figure 4-3-14-3: LLDP Neighbor Information Page Screenshot

The page includes the following fields:

Object	Description
• Local Port	The port on which the LLDP frame was received.
• Chassis ID	The Chassis ID is the identification of the neighbor's LLDP frames.
• Remote Port ID	The Remote Port ID is the identification of the neighbor port.
• Port Description	Port Description is the port description advertised by the neighbor unit.
• System Name	System Name is the name advertised by the neighbor unit.
• System Capabilities	<p>System Capabilities describes the neighbor unit's capabilities. The possible capabilities are:</p> <ol style="list-style-type: none"> 1. Other 2. Repeater 3. Bridge 4. WLAN Access Point 5. Router 6. Telephone 7. DOCSIS cable device 8. Station only 9. Reserved <p>When a capability is enabled, the capability is followed by (+). If the capability is disabled, the capability is followed by (-).</p>
• Management Address	Management Address is the neighbor unit's address that is used for higher layer entities to assist the discovery by the network management. This could for instance hold the neighbor's IP address.

Emergency Call Service

Emergency Call Service

Figure 4-3-14-4: LLDPMED Configuration Page Screenshot

The page includes the following fields:

Fast start repeat count

Object	Description
<ul style="list-style-type: none"> • Fast start repeat count 	<p>Rapid startup and Emergency Call Service Location Identification Discovery of endpoints is a critically important aspect of VoIP systems in general. In addition, it is best to advertise only those pieces of information which are specifically relevant to particular endpoint types (for example only advertise the voice network policy to permitted voice-capable devices), both in order to conserve the limited LLDPDU space and to reduce security and system integrity issues that can come with inappropriate knowledge of the network policy.</p> <p>With this in mind LLDP-MED defines an LLDP-MED Fast Start interaction between the protocol and the application layers on top of the protocol, in order to achieve these related properties. Initially, a Network Connectivity Device will only transmit LLDP TLVs in an LLDPDU. Only after an LLDP-MED Endpoint Device is detected, will an LLDP-MED capable Network Connectivity Device start to advertise LLDP-MED TLVs in outgoing LLDPDUs on the associated port. The LLDP-MED application will temporarily speed up the transmission of the LLDPDU to start within a second, when a new LLDP-MED neighbour has been detected in order share LLDP-MED information as fast as possible to new neighbours.</p> <p>Because there is a risk of an LLDP frame being lost during transmission between neighbours, it is recommended to repeat the fast start transmission multiple times to increase the possibility of the neighbours receiving the LLDP frame. With Fast start repeat count it is possible to specify the number of times the fast start transmission would be repeated. The recommended value is 4 times, given that 4 LLDP frames with a 1 second interval will be transmitted, when an LLDP frame with new information is received.</p> <p>It should be noted that LLDP-MED and the LLDP-MED Fast Start mechanism is only intended to run on links between LLDP-MED Network Connectivity Devices and Endpoint Devices, and as such does not apply to links between LAN infrastructure elements, including Network Connectivity Devices, or other types of links.</p>

LLDP-MED Interface Configuration

Object	Description
<ul style="list-style-type: none"> • Interface 	<p>The interface name to which the configuration applies.</p>
<ul style="list-style-type: none"> • Transmit TLVs - Capabilities 	<p>When checked the switch's capabilities is included in LLDP-MED information transmitted</p>
<ul style="list-style-type: none"> • Transmit TLVs - Policies 	<p>When checked the configured policies for the interface is included in LLDP-MED information transmitted.</p>
<ul style="list-style-type: none"> • Transmit TLVs - Location 	<p>When checked the configured location information for the switch is included in LLDP-MED information transmitted.</p>
<ul style="list-style-type: none"> • Transmit TLVs - PoE 	<p>When checked the configured PoE (Power Over Ethernet) information for the interface is included in LLDP-MED information transmitted</p>
<ul style="list-style-type: none"> • Device Type 	<p>Any LLDP-MED Device is operating as a specific type of LLDP-MED Device, which may be either a Network Connectivity Device or a specific Class of Endpoint Device, as defined below.</p> <p>A Network Connectivity Device is a LLDP-MED Device that provides access to the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint Devices</p> <p>An LLDP-MED Network Connectivity Device is a LAN access device based on any of the following technologies :</p> <ol style="list-style-type: none"> 1. LAN Switch/Router 2. IEEE 802.1 Bridge 3. IEEE 802.3 Repeater (included for historical reasons) 4. IEEE 802.11 Wireless Access Point 5. Any device that supports the IEEE 802.1AB and MED extensions that can relay IEEE 802 frames via any method. <p>An Endpoint Device a LLDP-MED Device that sits at the network edge and provides some aspect of IP communications service, based on IEEE 802 LAN technology.</p> <p>The main difference between a Network Connectivity Device and an Endpoint Device is that only an Endpoint Device can start the LLDP-MED information exchange.</p> <p>Even though a switch always should be a Network Connectivity Device, it is possible to configure it to act as an Endpoint Device, and thereby start the LLDP-MED information exchange (In the case where two Network Connectivity Devices are connected together)</p>

Coordinates Location

Object	Description
<ul style="list-style-type: none"> • Latitude 	<p>Latitude SHOULD be normalized to within 0-90 degrees with a maximum of 4 digits.</p> <p>It is possible to specify the direction to either North of the equator or South of the equator.</p>
<ul style="list-style-type: none"> • Longitude 	<p>Longitude SHOULD be normalized to within 0-180 degrees with a maximum of 4 digits.</p> <p>It is possible to specify the direction to either East of the prime meridian or West of the prime meridian.</p>
<ul style="list-style-type: none"> • Altitude 	<p>Altitude SHOULD be normalized to within -32767 to 32767 with a maximum of 4 digits.</p> <p>It is possible to select between two altitude types (floors or meters).</p> <p>Meters: Representing meters of Altitude defined by the vertical datum specified.</p> <p>Floors: Representing altitude in a form more relevant in buildings which have different floor-to-floor dimensions. An altitude = 0.0 is meaningful even outside a building, and represents ground level at the given latitude and longitude. Inside a building, 0.0 represents the floor level associated with ground level at the main entrance.</p>
<ul style="list-style-type: none"> • Map Datum 	<p>The Map Datum used for the coordinates given in this Option</p> <ul style="list-style-type: none"> ■ WGS84: (Geographical 3D) - World Geodesic System 1984, CRS Code 4327, Prime Meridian Name: Greenwich. ■ NAD83/NAVD88: North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich; The associated vertical datum is the North American Vertical Datum of 1988 (NAVD88). This datum pair is to be used when referencing locations on land, not near tidal water (which would use Datum = NAD83/MLLW). ■ NAD83/MLLW: North American Datum 1983, CRS Code 4269, Prime Meridian Name: Greenwich; The associated vertical datum is Mean Lower Low Water (MLLW). This datum pair is to be used when referencing locations on water/sea/ocean.

Civic Address Location

IETF Geopriv Civic Address based Location Configuration Information (Civic Address LCI).

Object	Description
• Country code	The two-letter ISO 3166 country code in capital ASCII letters - Example: DK, DE or US.
• State	National subdivisions (state, canton, region, province, prefecture).
• County	County, parish, gun (Japan), district.
• City	City, township, shi (Japan) - Example: Copenhagen
• City district	City division, borough, city district, ward, chou (Japan)
• Block (Neighborhood)	Neighborhood, block
• Street	Street - Example: Poppelvej
• Leading street direction	Leading street direction - Example: N
• Trailing street suffix	Trailing street suffix - Example: SW
• Street suffix	Street suffix - Example: Ave, Platz
• House no.	House number - Example: 21
• House no. suffix	House number suffix - Example: A, 1/2
• Landmark	Landmark or vanity address - Example: Columbia University
• Additional location info	Additional location info - Example: South Wing
• Name	Name (residence and office occupant) - Example: Flemming Jahn
• Zip code	Postal/zip code - Example: 2791
• Building	Building (structure) - Example: Low Library
• Apartment	Unit (Apartment, suite) - Example: Apt 42
• Floor	Floor - Example: 4
• Room no.	Room number - Example: 450F
• Place type	Place type - Example: Office
• Postal community name	Postal community name - Example: Leonia
• P.O. Box	Post office box (P.O. BOX) - Example: 12345
• Additional code	Additional code - Example: 1320300003

Emergency Call Service

Emergency Call Service (e.g. E911 and others), such as defined by TIA or NENA.

Object	Description
<ul style="list-style-type: none"> Emergency Call Service 	<p>Emergency Call Service ELIN identifier data format is defined to carry the ELIN identifier as used during emergency call setup to a traditional CAMA or ISDN trunk-based PSAP. This format consists of a numerical digit string, corresponding to the ELIN to be used for emergency calling.</p>

Policies

Network Policy Discovery enables the efficient discovery and diagnosis of mismatch issues with the VLAN configuration, along with the associated Layer 2 and Layer 3 attributes, which apply for a set of specific protocol applications on that port. Improper network policy configurations are a very significant issue in VoIP environments that frequently result in voice quality degradation or loss of service.

Policies are only intended for use with applications that have specific 'real-time' network policy requirements, such as interactive voice and/or video services.

The network policy attributes advertised are:

1. Layer 2 VLAN ID (IEEE 802.1Q-2003)
2. Layer 2 priority value (IEEE 802.1D-2004)
3. Layer 3 Diffserv code point (DSCP) value (IETF RFC 2474)

This network policy is potentially advertised and associated with multiple sets of application types supported on a given port.

The application types specifically addressed are:

1. Voice
2. Guest Voice
3. Softphone Voice
4. Video Conferencing
5. Streaming Video
6. Control / Signaling (conditionally support a separate network policy for the media types above)

A large network may support multiple VoIP policies across the entire organization, and different policies per application type. LLDP-MED allows multiple policies to be advertised per port, each corresponding to a different application type. Different ports on the same Network Connectivity Device may advertise different sets of policies, based on the authenticated user identity or port configuration.

It should be noted that LLDP-MED is not intended to run on links other than between Network Connectivity Devices and Endpoints, and therefore does not need to advertise the multitude of network policies that frequently run on an aggregated link interior to the LAN.

Object	Description
<ul style="list-style-type: none"> • Delete 	<p>Check to delete the policy. It will be deleted during the next save.</p>
<ul style="list-style-type: none"> • Policy ID 	<p>ID for the policy. This is auto generated and shall be used when selecting the polices that shall be mapped to the specific ports.</p>
<ul style="list-style-type: none"> • Application Type 	<p>Intended use of the application types:</p> <ul style="list-style-type: none"> ■ Voice - for use by dedicated IP Telephony handsets and other similar appliances supporting interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security by isolation from data applications. ■ Voice Signaling (conditional) - for use in network topologies that require a different policy for the voice signaling than for the voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Voice application policy. ■ Guest Voice - support a separate 'limited feature-set' voice service for guest users and visitors with their own IP Telephony handsets and other similar appliances supporting interactive voice services. ■ Guest Voice Signaling (conditional) - for use in network topologies that require a different policy for the guest voice signaling than for the guest voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Guest Voice application policy.

	<ul style="list-style-type: none"> ■ Softphone Voice - for use by softphone applications on typical data centric devices, such as PCs or laptops. This class of endpoints frequently does not support multiple VLANs, if at all, and are typically configured to use an 'untagged' VLAN or a single 'tagged' data specific VLAN. When a network policy is defined for use with an 'untagged' VLAN (see Tagged flag below), then the L2 priority field is ignored and only the DSCP value has relevance. ■ Video Conferencing - for use by dedicated Video Conferencing equipment and other similar appliances supporting real-time interactive video/audio services. ■ Streaming Video - for use by broadcast or multicast based video content distribution and other similar applications supporting streaming video services that require specific network policy treatment. Video applications relying on TCP with buffering would not be an intended use of this application type. ■ Video Signaling (conditional) - for use in network topologies that require a separate policy for the video signaling than for the video media. This application type should not be advertised if all the same network policies apply as those advertised in the Video Conferencing application policy.
<ul style="list-style-type: none"> • Tag 	<p>Tag indicating whether the specified application type is using a 'tagged' or an 'untagged' VLAN.</p> <ul style="list-style-type: none"> ■ Untagged indicates that the device is using an untagged frame format and as such does not include a tag header as defined by IEEE 802.1Q-2003. In this case, both the VLAN ID and the Layer 2 priority fields are ignored and only the DSCP value has relevance. ■ Tagged indicates that the device is using the IEEE 802.1Q tagged frame format, and that both the VLAN ID and the Layer 2 priority values are being used, as well as the DSCP value. The tagged format includes an additional field, known as the tag header. The tagged frame format also includes priority tagged frames as defined by IEEE 802.1Q-2003.
<ul style="list-style-type: none"> • VLAN ID 	<p>VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003</p>
<ul style="list-style-type: none"> • L2 Priority 	<p>L2 Priority is the Layer 2 priority to be used for the specified application type. L2 Priority may specify one of eight priority levels (0 through 7), as defined by IEEE 802.1D-2004. A value of 0 represents use of the default priority as defined in IEEE 802.1D-2004.</p>

<ul style="list-style-type: none"> • DSCP 	<p>DSCP value to be used to provide Diffserv node behavior for the specified application type as defined in IETF RFC 2474. DSCP may contain one of 64 code point values (0 through 63). A value of 0 represents use of the default DSCP value as defined in RFC 2475.</p>
<ul style="list-style-type: none"> • Adding a new policy 	<p>Click  to add a new policy. Specify the Application type, Tag, VLAN ID, L2 Priority and DSCP for the new policy. Click "Save". The number of policies supported is 32</p>

Port Policies Configuration

Every port may advertise a unique set of network policies or different attributes for the same network policies, based on the authenticated user identity or port configuration.

Object	Description
<ul style="list-style-type: none"> • Port 	<p>The port number for which the configuration applies.</p>
<ul style="list-style-type: none"> • Policy ID 	<p>The set of policies that shall apply for a given port. The set of policies is selected by checkmarking the checkboxes that corresponds to the policies</p>

4.3.14.5 LLDP-MED Neighbor

This page provides a status overview for all LLDP-MED neighbors. The displayed table contains a row for each port on which an LLDP neighbor is detected. The LLDP-MED Neighbor Information screen in [Figure 4-3-14-5](#) appears. The columns hold the following information:

LLDP-MED Neighbour Information					
Port 1					
Device Type	Capabilities				
Endpoint Class III	LLDP-MED Capabilities, Network Policy, Extended Power via MDI - PD, Inventory				
Application Type	Policy	Tag	VLAN ID	Priority	DSCP
Voice	Defined	Untagged	-	-	46
Voice Signaling	Defined	Untagged	-	-	32
Auto-negotiation	Auto-negotiation status	Auto-negotiation Capabilities		MAU Type	
Supported	Enabled	1000BASE-T half duplex mode, 1000BASE-X, -LX, -SX, -CX full duplex mode, Asymmetric and Symmetric PAUSE for full-duplex links, Symmetric PAUSE for full-duplex links		100BaseTXFD - 2 pair category 5 UTP, full duplex mode	

Figure 4-3-14-5: LLDP-MED Neighbor Information Page Screenshot

The page includes the following fields:

Fast start repeat count

Object	Description
<ul style="list-style-type: none"> • Port 	The port on which the LLDP frame was received.
<ul style="list-style-type: none"> • Device Type 	<p>LLDP-MED Devices are comprised of two primary Device Types: Network Connectivity Devices and Endpoint Devices.</p> <p>LLDP-MED Network Connectivity Device Definition</p> <p>LLDP-MED Network Connectivity Devices, as defined in TIA-1057, provide access to the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint Devices. An LLDP-MED Network Connectivity Device is a LAN access device based on any of the following technologies:</p> <ol style="list-style-type: none"> 1. LAN Switch/Router 2. IEEE 802.1 Bridge 3. IEEE 802.3 Repeater (included for historical reasons) 4. IEEE 802.11 Wireless Access Point 5. Any device that supports the IEEE 802.1AB and MED extensions defined by TIA-1057 and can relay IEEE 802 frames via any method.

LLDP-MED Endpoint Device Definition

Within the LLDP-MED Endpoint Device category, the LLDP-MED scheme is broken into further Endpoint Device Classes, as defined in the following. Each LLDP-MED Endpoint Device Class is defined to build upon the capabilities defined for the previous Endpoint Device Class. Fore-example will any LLDP-MED Endpoint Device claiming compliance as a Media Endpoint (Class II) also support all aspects of TIA-1057 applicable to Generic Endpoints (Class I), and any LLDP-MED Endpoint Device claiming compliance as a Communication Device (Class III) will also support all aspects of TIA-1057 applicable to both Media Endpoints (Class II) and Generic Endpoints (Class I).

LLDP-MED Generic Endpoint (Class I)

The LLDP-MED Generic Endpoint (Class I) definition is applicable to all endpoint products that require the base LLDP discovery services defined in TIA-1057, however do not support IP media or act as an end-user communication appliance. Such devices may include (but are not limited to) IP Communication Controllers, other communication related servers, or any device requiring basic services as defined in TIA-1057.

Discovery services defined in this class include LAN configuration, device location, network policy, power management, and inventory management.

LLDP-MED Media Endpoint (Class II)

The LLDP-MED Media Endpoint (Class II) definition is applicable to all endpoint products that have IP media capabilities however may or may not be associated with a particular end user. Capabilities include all of the capabilities defined for the previous Generic Endpoint Class (Class I), and are extended to include aspects related to media streaming. Example product categories expected to adhere to this class include (but are not limited to) Voice / Media Gateways, Conference Bridges, Media Servers, and similar.

Discovery services defined in this class include media-type-specific network layer policy discovery.

LLDP-MED Communication Endpoint (Class III)

The LLDP-MED Communication Endpoint (Class III) definition is applicable to all endpoint products that act as end user communication appliances supporting IP media. Capabilities include all of the capabilities defined for the previous Generic Endpoint (Class I) and Media Endpoint (Class II) classes, and are extended to include aspects related to end user devices. Example product categories expected to adhere to this class include (but are not limited to) end user communication appliances, such as IP Phones, PC-based softphones, or other communication appliances that directly support the end user.

Discovery services defined in this class include provision of location identifier (including ECS / E911 information), embedded L2 switch support, inventory

	management

8	0	0	0	0	0	0	0	0	<input checked="" type="checkbox"/>

Figure 4-3-14-6: LLDP Statistics Page Screenshot

The page includes the following fields:

Global Counters

Object	Description
• Clear global counters	If checked the global counters are cleared when <input type="button" value="Clear"/> is pressed.
• Neighbor entries were last changed	It also shows the time when the last entry was last deleted or added. It also shows the time elapsed since the last change was detected.
• Total Neighbors Entries Added	Shows the number of new entries added since switch reboot.
• Total Neighbors Entries Deleted	Shows the number of new entries deleted since switch reboot.
• Total Neighbors Entries Dropped	Shows the number of LLDP frames dropped due to that the entry table was full.
• Total Neighbors Entries Aged Out	Shows the number of entries deleted due to Time-To-Live expiring.

LLDP Statistics Local Counters

The displayed table contains a row for each port. The columns hold the following information:

Object	Description
• Local Port	The port on which LLDP frames are received or transmitted.
• Tx Frames	The number of LLDP frames transmitted on the port.
• Rx Frames	The number of LLDP frames received on the port.
• Rx Errors	The number of received LLDP frames containing some kind of error.
• Frames Discarded	If an LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port links down, an LLDP shutdown frame is received, or when the entry ages out.
• TLVs Discarded	Each LLDP frame can contain multiple pieces of information, known as TLVs (TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and discarded.
• TLVs Unrecognized	The number of well-formed TLVs, but with an unknown type value.
• Org. Discarded	The number of organizationally TLVs received.
• Age-Outs	Each LLDP frame contains information about how long time the LLDP information is valid (age-out time). If no new LLDP frame is received within the age out time, the LLDP information is removed, and the Age-Out counter is incremented.

Buttons

: Click to refresh the page immediately.

: Clears the local counters. All counters (including global counters) are cleared upon reboot.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.3.15 MAC Address Table

Switching of frames is based upon the DMAC address contained in the frame. The Managed Switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address have been seen after a configurable age time.

4.3.15.1 MAC Table Configuration

The MAC Address Table is configured on this page. Set timeouts for entries in the dynamic MAC Table and configure the static MAC table here. The MAC Address Table Configuration screen in [Figure 4-3-15-1](#) appears.

Static MAC Table Configuration

Delete	VLAN ID	MAC Address	Port Members												
			1	2	3	4	5	6	7	8	9	10			

Figure 4-3-15-1: MAC Address Table Configuration Page Screenshot

The page includes the following fields:

Aging Configuration

By default, dynamic entries are removed from the MAC table after 300 seconds. This removal is also called aging.

Object	Description
<ul style="list-style-type: none"> • Disable Automatic Aging 	Enables/disables the automatic aging of dynamic entries
<ul style="list-style-type: none"> • Aging Time 	The time after which a learned entry is discarded. By default, dynamic entries are removed from the MAC after 300 seconds. This removal is also called aging. (Range: 10-10000000 seconds; Default: 300 seconds)

MAC Table Learning

If the learning mode for a given port is grayed out, another module is in control of the mode, so that it cannot be changed by the user. An example of such a module is the MAC-Based Authentication under 802.1X.

Object	Description
<ul style="list-style-type: none"> • Auto 	Learning is done automatically as soon as a frame with unknown SMAC is received.
<ul style="list-style-type: none"> • Disable 	No learning is done.
<ul style="list-style-type: none"> • Secure 	Only static MAC entries are learned, all other frames are dropped. Note: Make sure that the link used for managing the switch is added to the Static Mac Table before changing to secure learning mode, otherwise the management link is lost and can only be restored by using another non-secure port or by connecting to the switch via the serial interface.

Static MAC Table Configuration

The static entries in the MAC table are shown in this table. The static MAC table can contain 64 entries. The MAC table is sorted first by VLAN ID and then by MAC address.

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • VLAN ID 	The VLAN ID of the entry.
<ul style="list-style-type: none"> • MAC Address 	The MAC address of the entry.
<ul style="list-style-type: none"> • Port Members 	Checkmarks indicate which ports are members of the entry. Check or uncheck as needed to modify the entry.
<ul style="list-style-type: none"> • Adding a New Static Entry 	Click  to add a new entry to the static MAC table. Specify the VLAN ID, MAC address, and port members for the new entry. Click "Save".

Buttons

Figure 4-3-15-2: MAC Address Table Status Page Screenshot

Navigating the MAC Table

Each page shows up to 999 entries from the MAC table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the MAC Table. The first displayed will be the one with the lowest VLAN ID and the lowest MAC address found in the MAC Table.

The "Start from MAC address" and "VLAN" input fields allow the user to select the starting point in the MAC Table. Clicking the "Refresh" button will update the displayed table starting from that or the closest next MAC Table match.

In addition, the two input fields will - upon a "Refresh" button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The ">>" will use the last entry of the currently displayed VLAN/MAC address pairs as a basis for the next lookup. When the end is reached the text "no more entries" is shown in the displayed table. Use the "|<<" button to start over.

The page includes the following fields:

Object	Description
• Type	Indicates whether the entry is a static or dynamic entry.
• VLAN	The VLAN ID of the entry.
• MAC Address	The MAC address of the entry.
• Port Members	The ports that are members of the entry.

Buttons

Auto-refresh Automatic refresh occurs every 3 seconds.

: Refreshes the displayed table starting from the "Start from MAC address" and "VLAN" input fields.

: Flushes all dynamic entries.

: Updates the table starting from the first entry in the MAC Table, i.e. the entry with the lowest VLAN ID and MAC address.

: Updates the table, starting with the entry after the last entry currently displayed.

4.3.16 Loop Protection

This chapter describes enabling loop protection function that provides loop protection to prevent broadcast loops in Managed Switch.

4.3.16.1 Configuration

This page allows the user to inspect the current Loop Protection configurations, and possibly change them as well as screen in [Figure 4-3-16-1](#) appears.

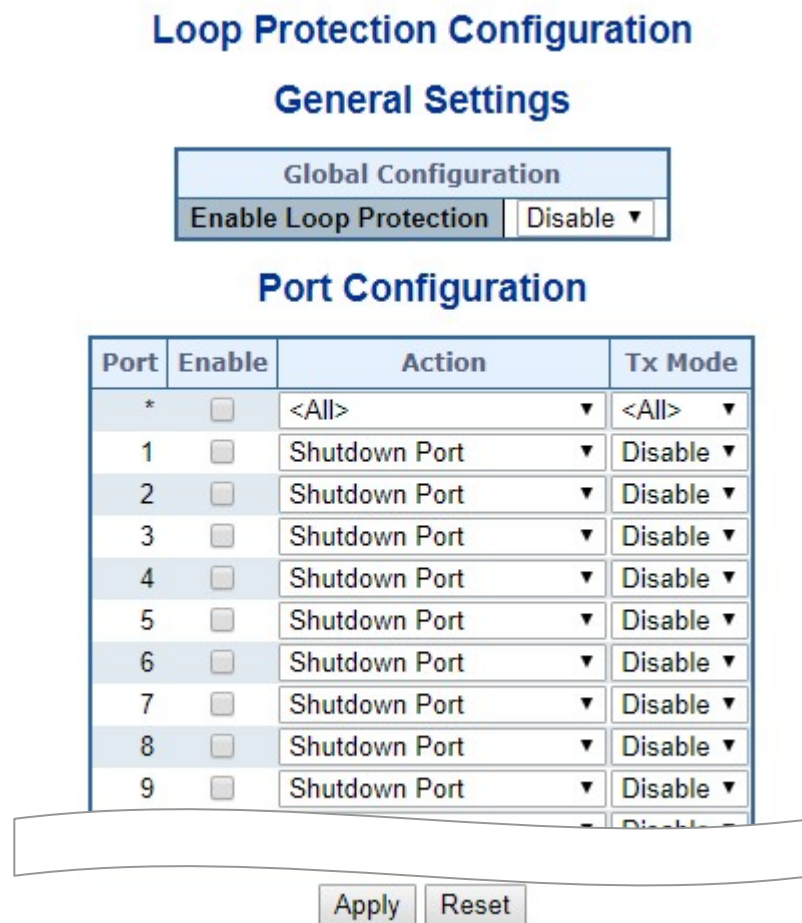

Figure 4-3-16-1: Loop Protection Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description
<ul style="list-style-type: none"> Enable Loop Protection 	Controls whether loop protection is enabled (as a whole).

Port Configuration

Object	Description
• Port	The switch port number of the port.
• Enable	Controls whether loop protection is enabled on this switch port.
• Action	Configures the action performed when a loop is detected on a port. Valid values are Shutdown Port , Shutdown Port and Log or Log Only .
• Tx Mode	Controls whether the port is actively generating loop protection PDU's, or whether it is just passively looking for looped PDU's.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.16.2 Loop Protection Status

This page displays the loop protection port status of the switch; screen in [Figure 4-3-16-2](#) appears.

Figure 4-3-16-2: Loop Protection Status Screenshot

The page includes the following fields:

Object	Description
• Port	The Managed Switch port number of the logical port.
• Action	The currently configured port action.
• Transmit	The currently configured port transmit mode.
• Loops	The number of loops detected on this port.
• Status	The current loop protection status of the port.
• Loop	Whether a loop is currently detected on the port.
• Time of Last Loop	The time of the last loop event detected.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to enable an automatic refresh of the page at regular intervals.

4.3.17 UDLD

Unidirectional Link Detection (UDLD) is a data link layer protocol from Cisco Systems to monitor the physical configuration of the cables and detect unidirectional links. UDLD complements the Spanning Tree Protocol which is used to eliminate switching loops..

4.3.17.1 UDLD Port Configuration

This page allows the user to inspect the current [UDLD](#) configurations, and possibly change them as well. as screen in [Figure 4-3-17-1](#) appears.

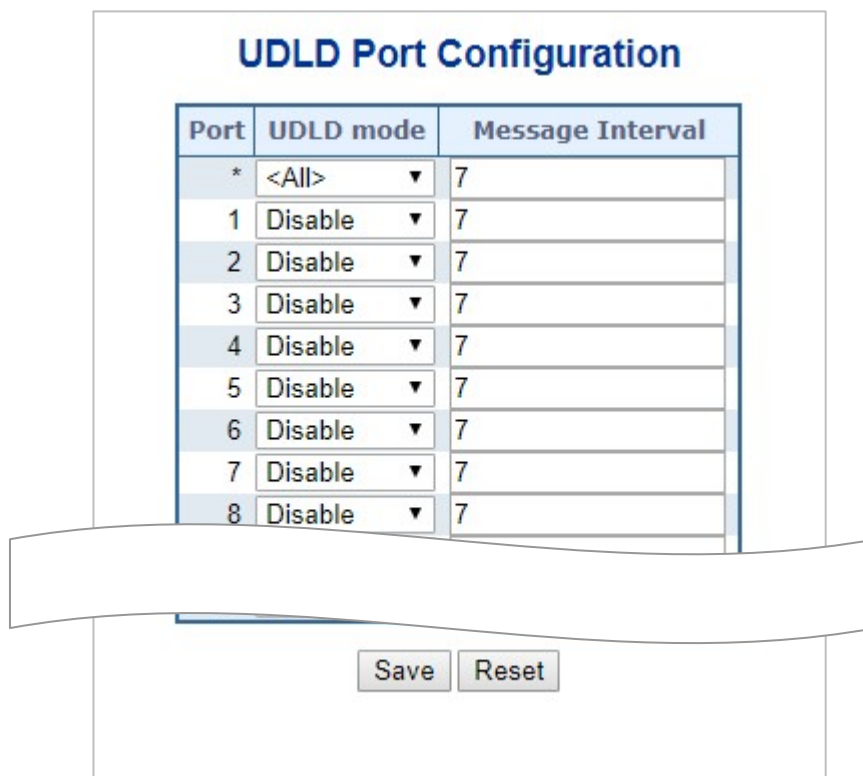

Figure 4-3-17-1: UDLD Configuration Page Screenshot

The page includes the following fields:

General Settings

Object	Description
<ul style="list-style-type: none"> • Port 	Port number of the switch.
<ul style="list-style-type: none"> • UDLD Mode 	<p>Configures the UDLD mode on a port. Valid values are Disable, Normal and Aggressive. Default mode is Disable.</p> <p>Disable: In disabled mode, UDLD functionality doesn't exists on port..</p> <p>Normal: In normal mode, if the link state of the port was determined to be unidirectional, it will not affect the port state.</p> <p>Aggressive: In aggressive mode, unidirectional detected ports will get shutdown. To bring back the ports up, need to disable UDLD on that port</p>
<ul style="list-style-type: none"> • Message Interval 	Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are determined to be bidirectional. The range is from 7 to 90 seconds(Default value is 7 seconds)(Currently default time interval is supported, due to lack of detailed information in RFC 5171).

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.3.17.2 UDLD Status

This page displays the [UDLD](#) status of the ports as well. as screen in [Figure 4-3-17-2](#) appears.

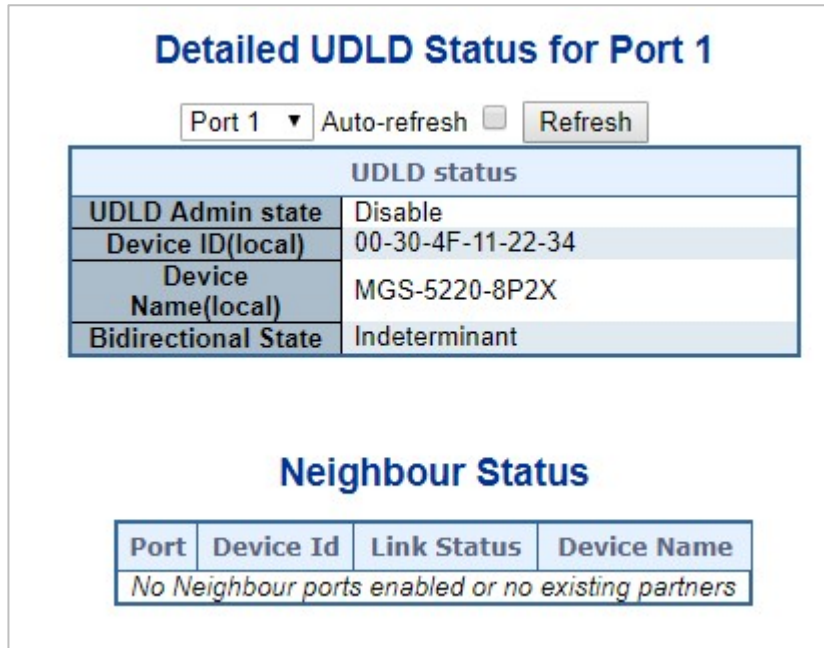

Figure 4-3-17-2: UDLD status Page Screenshot

The page includes the following fields:

UDLD port status

Object	Description
• UDLD Admin State	The current port state of the logical port, Enabled if any of state(Normal,Aggressive) is Enabled.
• Device ID(local)	The ID of Device
• Device Name(local)	Name of the Device.
• Bidirectional State	The current state of the port.

Neighbour Status

Object	Description
• Port	The current port of neighbour device
• Device ID	The current ID of neighbour device.
• Link Status	The current link status of neighbour port.
• Device Name	Name of the Neighbour Device.

Buttons

Figure 4-3-18-4: Port Status Page Screenshot

The page includes the following fields:

General Settings

Object	Description
<ul style="list-style-type: none"> • Port 	The switch port number.
<ul style="list-style-type: none"> • OAM Enabled 	Controls whether Link OAM is enabled on this switch port. Enabling Link OAM provides the network operators the ability to monitor the health of the network and quickly determine the location of failing links or fault conditions.

<ul style="list-style-type: none"> • OAM Mode 	<p>Configures the OAM Mode as Active or Passive. The default mode is Passive.</p> <ul style="list-style-type: none"> ■ Active mode DTE's configured in Active mode initiate the exchange of Information OAMPDUs as defined by the Discovery process. Once the Discovery process completes, Active DTE's are permitted to send any OAMPDU while connected to a remote OAM peer entity in Active mode. Active DTE's operate in a limited respect if the remote OAM entity is operating in Passive mode. Active devices should not respond to OAM remote loopback commands and variable requests from a Passive peer. ■ Passive mode DTE's configured in Passive mode do not initiate the Discovery process. Passive DTE's react to the initiation of the Discovery process by the remote DTE. This eliminates the possibility of passive to passive links. Passive DTE's shall not send Variable Request or Loopback Control OAMPDUs.
<ul style="list-style-type: none"> • Loopback Support 	<p>Controls whether the loopback support is enabled for the switch port. Link OAM remote loopback can be used for fault localization and link performance testing. Enabling the loopback support will allow the DTE to execute the remote loopback command that helps in the fault detection.</p>
<ul style="list-style-type: none"> • Link Monitor Support 	<p>Controls whether the Link Monitor support is enabled for the switch port. On enabling the Link Monitor support, the DTE supports event notification that permits the inclusion of diagnostic information.</p>
<ul style="list-style-type: none"> • MIB Retrieval Support 	<p>Controls whether the MIB Retrieval Support is enabled for the switch port. On enabling the MIB retrieval support, the DTE supports polling of various Link OAM based MIB variables' contents.</p>
<ul style="list-style-type: none"> • Loopback Operation 	<p>If the Loopback support is enabled, enabling this field will start a loopback operation for the port.</p>

Reset

Figure 4-3-18-5: Event Settings Page Screenshot

The page includes the following fields:

General Settings

Object	Description
• Port	The switch port number.
• Event Name	Name of the Link Event which is being configured.
• Error Window	Represents the window period in the order of 1 sec for the observation of various link events.
• Error Threshold	Represents the threshold value for the window period for the appropriate Link event so as to notify the peer of this error.
• Error Frame Event	The Errored Frame Event counts the number of errored frames detected during the specified period. The period is specified by a time interval (Window in order of 1 sec). This event is generated if the errored frame count is equal to or greater than the specified threshold for that period (Period Threshold). Errored frames are frames that had transmission errors as detected at the Media Access Control sublayer. Error Window for 'Error Frame Event' must be an integer value between 1-60 and its default value is '1'. Whereas Error Threshold must be between 0-4294967295 and its default value is '1'.
• Symbol Period Error Event	ved in a time interval on the underlying physical layer. This event is generated if the symbol error count is equal to or greater than the specified threshold for that period. Error Window for 'Symbol Period Error Event' must be an integer value between 1-60 and its default value is '1'. Whereas Error Threshold must be between 0-4294967295 and its default value is '1'.

<ul style="list-style-type: none">• Seconds Summary Event	<p>The Errored Frame Seconds Summary Event TLV counts the number of errored frame seconds that occurred during the specified period. The period is specified by a time interval. This event is generated if the number of errored frame seconds is equal to or greater than the specified threshold for that period. An errored frame second is a one second interval wherein at least one frame error was detected. Errored frames are frames that had transmission errors as detected at the Media Access Control sublayer. Error Window for 'Seconds Summary Event' must be an integer value between 10-900 and its default value is '60'. Whereas Error Threshold must be between 0-65535 and its default value is '1'.</p>

4.3.19.2 Port Status

Configure CFM Domain parameters on this page.

CFM Domain Configuration

Delete	Domain	Format	Name	Level	TLV option select			
					Sender Id	Port Status	Interface Status	Org. Specific
* No entry exists								

The displayed settings are:

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save
<ul style="list-style-type: none"> • Domain 	Name of Domain. Value is a single word which begins with an alphabetic letter A-Z or a-z with length 1-15.
<ul style="list-style-type: none"> • Format 	Select the MD name format. To mimic Y.1731 MEG IDs, use type None. None String

<ul style="list-style-type: none"> • Name 	<p>The contents of this parameter depends on the value of the format member.</p> <p>If format is None: Name is not used, but will be set to all-zeros behind the scenes. This format is typically used by Y.1731-kind-of-PDUs.</p> <p>If format is String: Name must contain a string from 1 to 43 characters long.</p>
<ul style="list-style-type: none"> • Level 	<p>MD/MEG level of this domain. Valid values are restricted to 0 - 7.</p> <p>About leak prevention</p> <p>Leak prevention is about discarding OAM PDUs with MEG levels lower than the MEP they hit when the OAM PDUs are ingressing the port on which the MEP resides, and to discard OAM PDUs with MEG levels at or lower than the MEP's when the OAM PDUs are ingressing other ports.</p> <p>There are two categories of architectures, when it comes to leak-prevention: Those that use Shared MEG level and those that use Independent MEG level:</p> <p>Shared MEG level</p> <p>On Shared MEG level architectures, Port Down MEPs always perform level filtering no matter which VLAN ID (VID) OAM PDUs get classified to, unless the same port has a VLAN MEP on the VID in question. So if you have a Port MEP in VID X and a VLAN MEP in VID Y, an OAM frame arriving on the port and gets classified to VID X or VID Z will be handled/level-filtered by the Port MEP, whereas an OAM frame ingressing the port in VID Y will be handled by the VLAN MEP. Likewise, if the switch has a Port MEP on VID X on Port X and an OAM frame ingresses on VID Y on Port Y, it is subject to level filtering before egressing Port X, unless Port X also has a VLAN MEP on VID Y, in which case the VLAN MEP will take care of level-filtering the OAM PDU.</p> <p>On Shared MEG level architectures, all Port MEPs must have the same MEG level and any VLAN MEP must have a MEG level higher than the Port MEPs' MEG level.</p> <p>Independent MEG level</p> <p>On Independent MEG level architectures, Port Down MEPs never perform level filtering on frames not classified to the MEP's VID. So if you have a Port MEP on VID X and a VLAN MEP on VID Y and an OAM frame ingresses any port on VID Z, it is not subject to handling/level-filtering by any of the two MEPs.</p> <p>This switch exhibits Independent MEG level.</p>

<ul style="list-style-type: none"> • TLV option select 	<p>Sender Id: Default Sender ID TLV format to be used in CCMs generated by this Domain (may be overridden in service)</p> <p>None Do not include Sender ID TLVs.</p> <p>Chassis Enable Sender ID TLV and send Chassis ID (MAC Address).</p> <p>Manage Enable Sender ID TLV and send Management address (IPv4 Address).</p> <p>ChassisManage Enable Sender ID TLV and send both Chassis ID (MAC Address) and Management Address (IPv4 Address).</p> <p>Defer Let the global configuration decide if Sender ID TLVs shall be included (may be overridden in service).</p> <p>Port Status: Include or exclude Port Status TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).</p> <p>Disable Do not include Port Status TLVs.</p> <p>Enable Include Port Status TLVs.</p> <p>Defer Let the global configuration decide if Port Status TLVs shall be included (may be overridden in Service).</p> <p>Interface Status: Include or exclude Interface Status TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).</p> <p>Disable Do not include Interface Status TLVs.</p> <p>Enable Include Interface Status TLVs.</p> <p>Defer Let the global configuration decide if Interface Status TLVs shall be included (may be overridden in Service).</p> <p>Org. Specific: Exclude Organization-Specific TLV in CCMs generated by this Domain or let higher level determine (may be overridden in Service).</p> <p>Disable Do not include Organization-Specific TLVs.</p> <p>Defer Let the global configuration decide if Organization-Specific TLVs shall be included (may be overridden in Service).</p>

4.3.19.3 Service

Configure CFM Service parameters on this page.

CFM Service Configuration

Delete	Domain	Service	Format	Name	VLAN	CCM Interval	TLV option select			
							Sender Id	Port Status	Interface Status	Org. Specific
* No entry exists										

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save
• Domain	Name of Domain. Value is a single word which begins with an alphabetic letter A-Z or a-z with length 1-15.
• Service	Name of Service. Value is a single word which begins with an alphabetic letter A-Z or a-z with length 1-15.
• Format	Select the short Service name format. This decides how the value of the Name parameter will be interpreted. To mimic Y.1731 MEG IDs, create an MD instance with an empty name and use Y1731 ICC or Y1731 ICC CC. Possible values are: String Two Octets Y1731 ICC Y1731 ICC CC Look under Name for explanation.

<ul style="list-style-type: none"> • Name 	<p>The contents of this parameter depends on the value of the format member. Besides the limitations explained for each of them, the following applies in general:</p> <p>If the Domain Format is None, the size of this cannot exceed 45 bytes. If the Domain Format is not None, the size of this cannot exceed 44 bytes.</p> <p>If Format is String, the following applies: length must be in range [1; 44] Contents must be in range [32; 126]</p> <p>If Format is Two Octets, the following applies: Name[0] and Name[1] will both be interpreted as unsigned 8-bit integers (allowing a range of [0; 255]). Name[0] will be placed in the PDU before Name[1]. The remaining available bytes in name will not be used.</p> <p>If Format is Y1731 ICC, the following applies: length must be 13. Contents must be in range [a-z,A-Z,0-9] Y.1731 specifies that it is a concatenation of ICC (ITU Carrier Code) and UMC (Unique MEG ID Code): ICC: 1-6 bytes UMC: 7-12 bytes In principle UMC can be any value in range [1; 127], but this API does not allow for specifying length of ICC, so the underlying code doesn't know where ICC ends and UMC starts. The Domain Format must be None.</p> <p>If Format is Y1731 ICC CC, the following applies: length must be 15. First 2 chars (CC): Must be amongst [A-Z] Next 1-6 chars (ICC): Must be amongst [a-z,A-Z,0-9] Next 7-12 chars (UMC): Must be amongst [a-z,A-Z,0-9] There may be ONE (slash) present in name[3-7]. The Domain format must be None.</p>
<ul style="list-style-type: none"> • VLAN 	<p>The MA's primary VID. A primary VID of 0 means that all MEPs created within this MA will be created as port MEPs (interface MEPs). There can only be one port MEP per interface. A given port MEP may still be created with tags, if that MEP's VLAN is non-zero."</p> <p>A non-zero primary VID means that all MEPs created within this MA will be created as VLAN MEPs. A given MEP may be configured with another VLAN than the MA's primary VID, but it is impossible to have untagged VLAN MEPs.</p>
<ul style="list-style-type: none"> • CCM Interval 	<p>The CCM rate of all MEPs bound to this Service.</p>

<ul style="list-style-type: none"> • TLV option select 	<p>Sender Id: Default Sender ID TLV format to be used in CCMs generated by this Service.</p> <p>None Do not include Sender ID TLVs.</p> <p>Chassis Enable Sender ID TLV and send Chassis ID (MAC Address).</p> <p>Manage Enable Sender ID TLV and send Management address (IPv4 Address).</p> <p>ChassisManage Enable Sender ID TLV and send both Chassis ID (MAC Address) and Management Address (IPv4 Address).</p> <p>Defer Let the Domain configuration decide if Sender ID TLVs shall be included.</p> <p>Port Status: Include or exclude Port Status TLV in CCMs generated by this Service or let higher level determine.</p> <p>Disable Do not include Port Status TLVs.</p> <p>Enable Include Port Status TLVs.</p> <p>Defer Let the Domain configuration decide if Port Status TLVs shall be included.</p> <p>Interface Status: Include or exclude Interface Status TLV in CCMs generated by this Service or let higher level determine.</p> <p>Disable Do not include Interface Status TLVs.</p> <p>Enable Include Interface Status TLVs.</p> <p>Defer Let the Domain configuration decide if Interface Status TLVs shall be included.</p> <p>Org. Specific: Exclude Organization-Specific TLV in CCMs generated by this Service or let higher level determine.</p> <p>Disable Do not include Organization-Specific TLVs.</p> <p>Defer Let the Domain configuration decide if Organization-Specific TLVs shall be included.</p>

4.3.19.4 MEP

Configure CFM MEP parameters on this page.

This switch supports two types of MEP: Port Down-MEPs and VLAN Down-MEPs.

Port Down-MEPs

In 802.1Q terminology, Port MEPs are located below the EISS entity, that is, closest to the physical port. Port MEPs are used by e.g. [APS](#) for protection purposes.

Port MEPs are created when the encompassing service has type "Port".

Port MEPs may send OAM PDUs tagged or untagged. An OAM PDU will be sent untagged only if the MEP's VLAN is set to "Inherit" (0). Any other value will cause it to be sent tagged with the port's TPID, whether or not the VLAN matches the port's PVID and that PVID is meant to be sent untagged.

VLAN Down-MEPs

in 802.1Q terminology, VLAN MEPs are located above the EISS entity.

This means that tagging of OAM PDUs will follow the port's VLAN configuration.

Thus, if a VLAN MEP is created on the Port's PVID and PVID is configured to be untagged, OAM PDUs will be transmitted untagged.

VLAN MEPs are created when the encompassing service has type "VLAN".

Down-MEP creation rules

There are a few rules to obey when creating Down-MEPs:

1. There can only be one Port MEP on the same port.
2. There can only be one VLAN MEP on the same port and VLAN.
3. A VLAN MEP must have a higher MD/MEG level than a Port MEP on the same port and VLAN.

These checks are performed automatically on administratively enabled MEPs when you change a particular MEP, change the Service Type from Port to VLAN or vice versa, or change the domain's MD/MEG level.

CFM Mep Configuration

Delete	Domain	Service	MEPID	Direction	Port	VLAN	PCP	SMAC	Alarm Control			State Control		Remote MEPID
									Level	Present	Absent	CCM	Admin	
* No entry exists														

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save
• Domain	Name of Domain under which this MEP resides.

• Service	Name of Service under which this MEP resides.																		
• MEPID	The identification of this MEP. Must be an integer [1..8091]																		
• Direction	Set whether this MEP is an Up- or a Down-MEP.																		
• Port	Port on which this MEP resides.																		
• VLAN	VLAN ID. Use the value 0 to indicate untagged traffic (implies a port MEP)..																		
• PCP	Choose PCP value in PDUs' VLAN tag. Not used if untagged.																		
• SMAC	Set a Source MAC address to be used in CCM PDUs originating at this MEP. Must be a unicast address. Format is XX:XX:XX:XX:XX:XX. If all-zeros, the switch port's MAC address will be used instead.																		
• Alarm Control	<p>Level: If a defect is detected with a priority higher than this level, a fault alarm notification will be generated.</p> <p>Valid range is [1; 6] with 1 indicating that any defect will cause a fault alarm and 6 indicating that no defect can cause a fault alarm. See 802.1Q-2018, clause 20.9.5, LowestAlarmPri</p> <p>The possible defects and their priorities are:</p> <table border="1"> <thead> <tr> <th>Short name</th> <th>Description</th> <th>Priority</th> </tr> </thead> <tbody> <tr> <td>DefRDICCM</td> <td>Remote Defect Indication</td> <td>1</td> </tr> <tr> <td>DefMACstatus</td> <td>MAC Status</td> <td>2</td> </tr> <tr> <td>DefRemoteCCM</td> <td>Remote CCM</td> <td>3</td> </tr> <tr> <td>DefErrorCCM</td> <td>Error CCM Received</td> <td>4</td> </tr> <tr> <td>DefXconCCM</td> <td>Cross Connect CCM Received</td> <td>5</td> </tr> </tbody> </table> <p>Present: The time in milliseconds that defects must be present before a fault alarm notification is issued. Default is 2500 ms.</p> <p>Absent: The time in milliseconds that defects must be absent before a fault alarm notification is reset. Default is 10000 ms.</p>	Short name	Description	Priority	DefRDICCM	Remote Defect Indication	1	DefMACstatus	MAC Status	2	DefRemoteCCM	Remote CCM	3	DefErrorCCM	Error CCM Received	4	DefXconCCM	Cross Connect CCM Received	5

4.3.20 sFlow

4.3.20.1 sFlow Configuration

This page allows for configuring [sFlow](#). The configuration is divided into two parts: Configuration of the sFlow receiver (a.k.a. sFlow collector) and configuration of per-port flow and counter samplers.

sFlow configuration is not persisted to non-volatile memory, which means that a reboot will disable sFlow sampling.

sFlow Configuration

Agent Configuration

IP Address	<input type="text" value="127.0.0.1"/>
------------	----------------------------------------

Receiver Configuration

Owner	<input type="text" value="<none>"/>	<input type="button" value="Release"/>
IP Address/Hostname	<input type="text" value="0.0.0.0"/>	
UDP Port	<input type="text" value="6343"/>	
Timeout	<input type="text" value="0"/>	seconds
Max. Datagram Size	<input type="text" value="1400"/>	bytes

The displayed settings are:

Object	Description
<ul style="list-style-type: none"> • IP Address 	<p>The IP address used as Agent IP address in sFlow datagrams. It serves as a unique key that will identify this agent over extended periods of time.</p> <p>Both IPv4 and IPv6 addresses are supported.</p>
<ul style="list-style-type: none"> • Owner 	<p>Basically, sFlow can be configured in two ways: Through local management using the Web or CLI interface or through SNMP. This read-only field shows the owner of the current sFlow configuration and assumes values as follows:</p> <ul style="list-style-type: none"> • If sFlow is currently unconfigured/unclaimed, Owner contains <none>. • If sFlow is currently configured through Web or CLI, Owner contains <Configured through local management>. • If sFlow is currently configured through SNMP, Owner contains a string identifying the sFlow receiver. <p>If sFlow is configured through SNMP, all controls - except for the Release-button - are disabled to avoid inadvertent reconfiguration.</p> <p>The button allows for releasing the current owner and disable sFlow sampling. The button is disabled if sFlow is currently unclaimed. If configured through SNMP, the release must be confirmed (a confirmation request will appear).</p>
<ul style="list-style-type: none"> • IP Address/Hostname 	<p>The IP address or hostname of the sFlow receiver. Both IPv4 and IPv6 addresses are supported.</p>
<ul style="list-style-type: none"> • UDP Port 	<p>The UDP port on which the sFlow receiver listens to sFlow datagrams. If set to 0 (zero), the default port (6343) is used.</p>

<ul style="list-style-type: none"> • Timeout 	<p>The number of seconds remaining before sampling stops and the current sFlow owner is released. While active, the current time left can be updated with a click on the Refresh-button. If locally managed, the timeout can be changed on the fly without affecting any other settings. Valid range is 0 to 2147483647 seconds.</p>
<ul style="list-style-type: none"> • Max. Datagram Size 	<p>The maximum number of data bytes that can be sent in a single sample datagram. This should be set to a value that avoids fragmentation of the sFlow datagrams. Valid range is 200 to 1468 bytes with default being 1400 bytes.</p>

Port Configuration

Port	Flow Sampler			Counter Poller	
	Enabled	Sampling Rate	Max. Header	Enabled	Interval
*	<input type="checkbox"/>	0	128	<input type="checkbox"/>	0
1	<input type="checkbox"/>	0	128	<input type="checkbox"/>	0
2	<input type="checkbox"/>	0	128	<input type="checkbox"/>	0
3	<input type="checkbox"/>	0	128	<input type="checkbox"/>	0

-----------------------	-------------------------	-----------------------------	-----------------------------------------

Figure: 802.1AS Statistics Page Screenshot

Object	Description
• Delete SyncCount	A counter that increments every time when synchronization information is received.
• Clock Instance FollowUpCount	A counter that increments every time when a Follow Up message is received.
• HW Domain PdelayRequestCount	A counter that increments every time when a Pdelay_Req message is received.
• PdelayResponseCount	A counter that increments every time when a Pdelay_Resp message is received
• PdelayResponseFollowUpCount	A counter that increments every time when a Pdelay_Resp_Follow_Up message is received.
• AnnounceCount	A counter that increments every time when an Announce message is received
• PTPPacketDiscardCount	A counter that increments every time when a PTP message is discarded.
• syncReceiptTimeoutCount	A counter that increments every time when sync receipt timeout occurs
• announceReceiptTimeoutCount	A counter that increments every time when announce receipt timeout occurs
• Pdelay Allowed Lost Responses ExceededCount	A counter that increments everytime the value of the variable lostResponses exceeds the value of the variable allowedLostResponses
• AnnounceCount	A counter that increments every time an Announce message is transmitted.

Buttons

: Click to Display the configured values.

: Clears the statistics.

4.4 Routing

4.4.1 IP Configuration

The IP Configuration includes the IP Configuration, IP Interface and IP Routes. The configured column is used to view or change the IP configuration. The maximum number of interfaces supported is 128 and the maximum number of routes is 128. The screen in [Figure 4-4-1](#) appears.

IP Configuration

Domain Name	No Domain Name
Mode	Host
DNS Server	No DNS server
DNS Proxy	<input type="checkbox"/>

IP Interfaces

Delete	VLAN	DHCPv4			IPv4		DHCPv6			IPv6	
		Enable	Fallback	Current Lease	Address	Mask Length	Enable	Rapid Commit	Current Lease	Address	Mask Length
<input type="checkbox"/>	1	<input type="checkbox"/>	0		192.168.0.100	24	<input type="checkbox"/>	<input type="checkbox"/>			

IP Routes

Delete	Network	Mask Length	Gateway	Next Hop VLAN
<input type="button" value="Add Route"/>				

Figure 4-4-1: IP Configuration Page Screenshot

The current column is used to show the active IP configuration.

Object	Description
<ul style="list-style-type: none"> • IP Configurations 	<p>Domain Name</p> <p>Configure the Switch Domain Name</p>
	<p>Mode</p> <p>Configure whether the IP stack should act as a Host or a Router. In Host mode, IP traffic between interfaces will not be routed. In Router mode traffic is routed between all interfaces.</p>
	<p>DNS Server</p> <p>This setting controls the DNS name resolution done by the switch. The following modes are supported:</p> <ul style="list-style-type: none"> ■ No DNS server No DNS server will be used.. ■ Configure IPv4 or IPv6 Explicitly specify the name of local domain. Make sure the configured domain name meets your organization's given domain. ■ From any DHCPv6 interfaces The first domain name offered from a DHCPv6 lease to a DHCPv6-enabled interface will be used. ■ From this DHCPv6 interface Specify from which DHCPv6-enabled interface a provided domain name should be preferred.

	DNS Proxy	When DNS proxy is enabled, system will relay DNS requests to the currently configured DNS server, and reply as a DNS resolver to the client devices on the network.	
• IP Interface	Delete	Select this option to delete an existing IP interface.	
	VLAN	The VLAN associated with the IP interface. Only ports in this VLAN will be able to access the IP interface. This field is only available for input when creating a new interface.	
	IPv4 DHCP	Enabled	Enable the DHCP client by checking this box.
		Fallback	The number of seconds for trying to obtain a DHCP lease.
		Current Lease	For DHCP interfaces with an active lease, this column shows the current interface address, as provided by the DHCP server.
	IPv4	Address	Provide the IP address of this Managed Switch in dotted decimal notation.
		Mask Length	The IPv4 network mask, in number of bits (<i>prefix length</i>). Valid values are between 0 and 30 bits for an IPv4 address.
	DHCPv6	Enable	Enable the DHCPv6 client by checking this box. If this option is enabled, the system will configure the IPv6 address of the interface using the DHCPv6 protocol
		Rapid Commit	Enable the DHCPv6 Rapid-Commit option by checking this box. If this option is enabled, the DHCPv6 client terminates the waiting process as soon as a Reply message with a Rapid Commit option is received. This option is only manageable when DHCPv6 client is enabled.
		Current Lease	For DHCPv6 interface with an active lease, this column shows the interface address provided by the DHCPv6 server
	IPv6	Address	Provide the IP address of this Managed Switch. An IPv6 address is in 128-bit records represented as eight fields of up to four hexadecimal digits with a colon separating each field (:).
		Mask Length	The IPv6 network mask, in number of bits (<i>prefix length</i>). Valid values are between 1 and 128 bits for an IPv6 address.
• IP Routes	Delete	Select this option to delete an existing IP route.	
	Network	The destination IP network or host address of this route. Valid format is dotted decimal notation or a valid IPv6 notation. A default route can use the value 0.0.0.0 or IPv6 :: notation.	
	Mask Length	The destination IP network or host mask, in number of bits (<i>prefix length</i>).	
	Gateway	The IP address of the IP gateway. Valid format is dotted decimal notation or a valid IPv6 notation. Gateway and Network must be of the same type.	
	Next Hop VLAN	The VLAN ID (VID) of the specific IPv6 interface associated with the gateway.	

Buttons

: Click to add a new IP interface. A maximum of 128 interfaces are supported.

: Click to add a new IP route. A maximum of 32 routes are supported.

: Click to apply changes.

: Click to undo any changes made locally and revert to previously saved values.

4.4.2 IP Status

IP Status displays the status of the IP protocol layer. The status is defined by the IP interfaces, the IP routes and the neighbor cache (ARP cache) status. The screen in [Figure 4-4-2](#) appears.

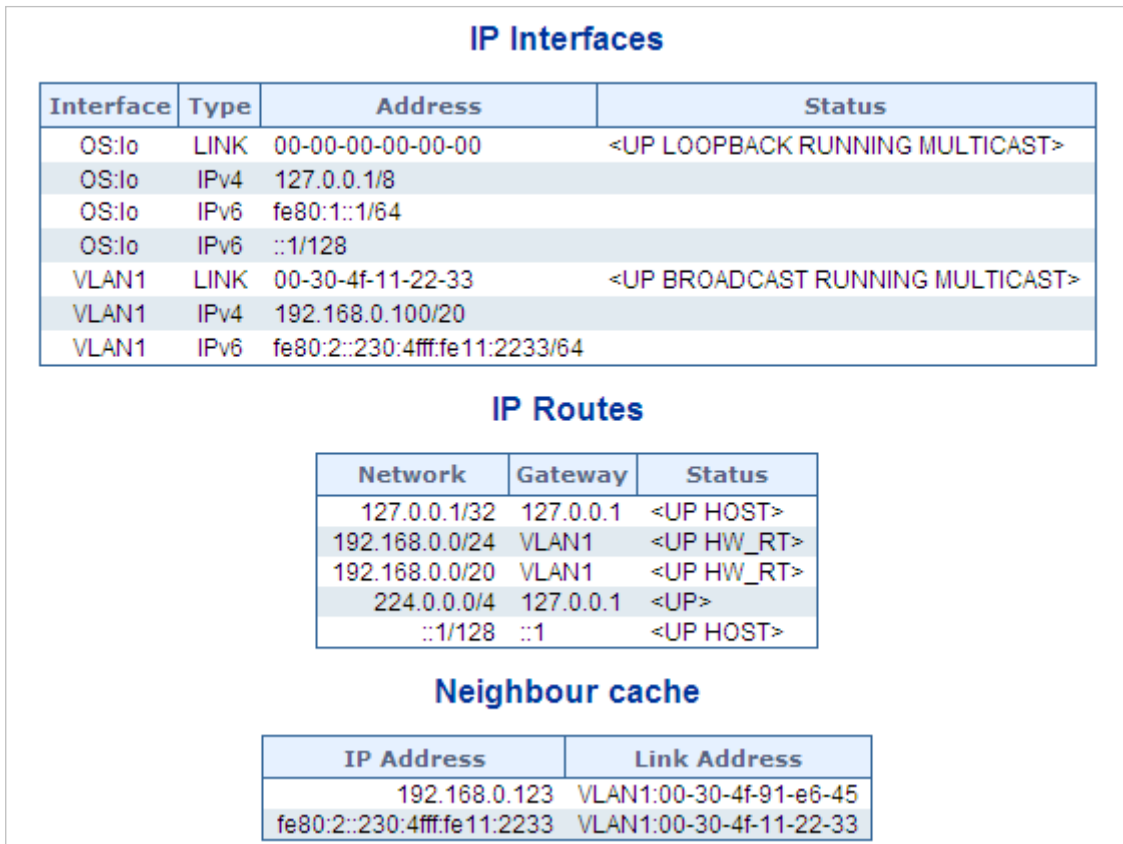

Figure 4-4-2: IP Status Page Screenshot

The page includes the following fields:

Object	Description	
• IP Interfaces	Interface	The name of the interface.
	Type	The address type of the entry. This may be LINK or IPv4 .
	Address	The current address of the interface (of the given type).
	Status	The status flags of the interface (and/or address).
• IP Routes	Network	The destination IP network or host address of this route.
	Gateway	The gateway address of this route.
	Status	The status flags of the route.
• Neighbor Cache	IP Address	The IP address of the entry.
	Link Address	The Link (MAC) address for which a binding to the IP address given exists.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page.

4.4.3 IPv4 Routing Info. Base

This is IPv4 route entry table. It is used to provide the route entries status information. The screen in [Figure 4-4-3](#) appears.

Routing Information Base

Start from Network / Protocol NextHop with entries per page.

Codes: C - connected, S - static, O - OSPF, * - selected route, D - DHCP installed route

1 - 1 of 1 entry Auto-refresh

Protocol	Network/Prefix	NextHop	Distance	Metric	Interface	Uptime (hh:mm:ss)	State
C *	192.168.0.0/24	-	-	-	VLAN 1	-	Active

Figure 4-4-3: IP Status Page Screenshot

The page includes the following fields:

Object	Description
Protocol	The protocol of the route. DHCP : The route is created by DHCP. Connected : The destination network is connected directly. Static : The route is created by user. OSPF : The route is created by OSPF.
Network/Prefix	Network and prefix (example 10.0.0.0/16) of the given route entry.
NextHop	The IP address of nexthop. Value '0.0.0.0' indicates the link is directly connected.
Distance	The distance of the route.
Metric	The metric of the route.
Interface	The interface where the ip packet is outgoing.
Uptime (hh:ss:mm)	The time till the route is created. The unit is second.
State	Indicate if the destination network is reachable or not.

Buttons

: Click to refresh the page

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table entries, starting from the first available entry. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the entry prior to the first entry currently displayed. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, starting from the entry next to the last entry currently displayed. If the last entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the last available entry. If the last entry of the table is displayed, the button is disabled..

4.4.4 IPv6 Routing Info. Base

This is IPv6 route entry table. It is used to provide the route entries status information. The screen in [Figure 4-4-4](#) appears.

Routing Information Base

Start from Network / Protocol NextHop
 with entries per page.

Codes: C - connected, S - static, O - OSPF, R - RIP, * - selected route, D - DHCP installed route

1 - 1 of 1 entry Auto-refresh Refresh

Protocol	Network/Prefix	NextHop	Distance	Metric	Interface	Uptime (hh:mm:ss)	State
C *	fe80::/64	::	-	-	VLAN 1	00:10:30	Active

Figure 4-4-4: IP Status Page Screenshot

The page includes the following fields:

Object	Description
Protocol	The protocol of the route. DHCP: The route is created by DHCP. Connected: The destination network is connected directly. Static: The route is created by user. OSPF: The route is created by OSPF.
Network/Prefix	Network and prefix (example 10.0.0.0/16) of the given route entry.
NextHop	The IP address of nexthop. Value '0.0.0.0' indicates the link is directly connected.
Distance	The distance of the route.
Metric	The metric of the route.
Interface	The interface where the ip packet is outgoing.
Uptime (hh:ss:mm)	The time till the route is created. The unit is second.
State	Indicate if the destination network is reachable or not.

Buttons

: Click to refresh the page

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

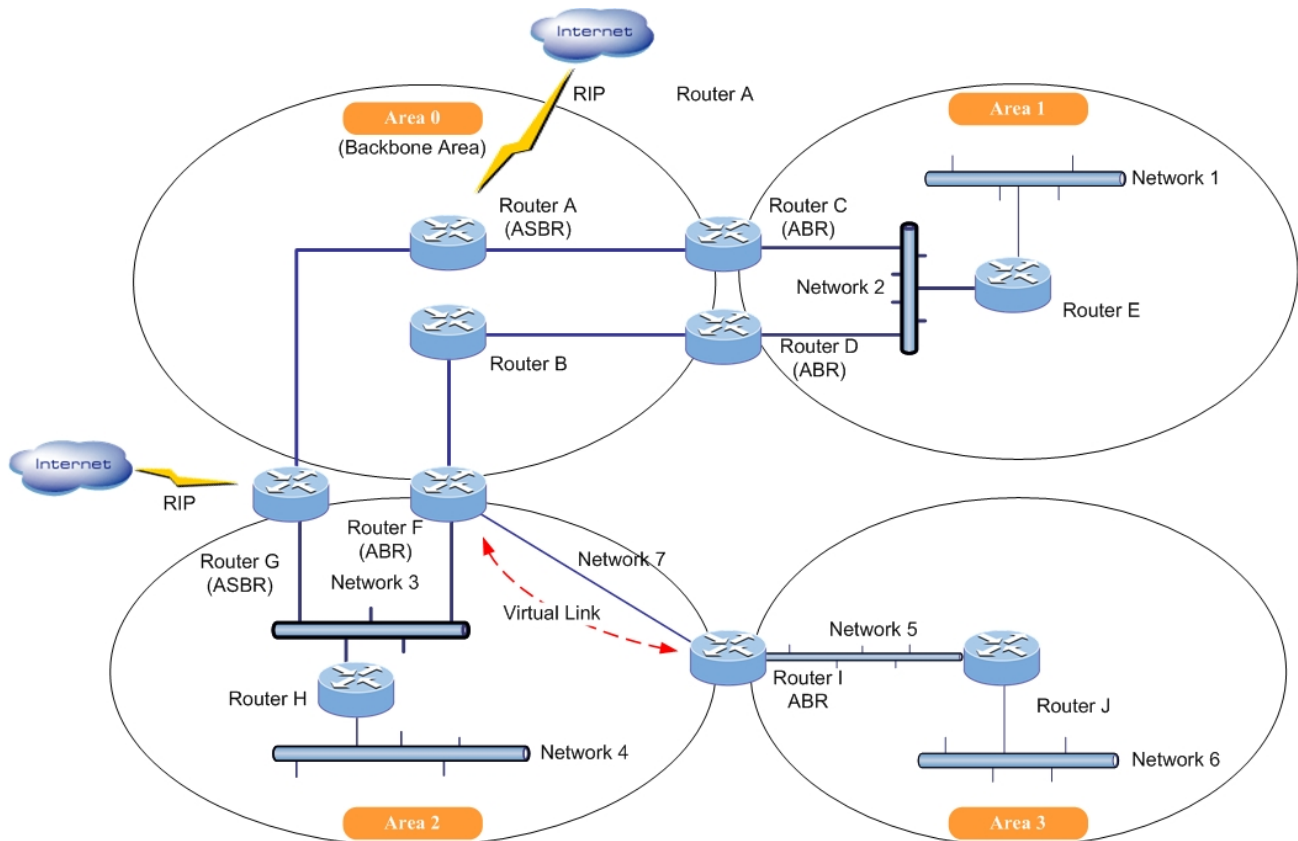

: Updates the table entries, starting from the first available entry. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the last available entry. If the last entry of the table is displayed, the button is disabled..

4.4.5 OSPF

Open Shortest Path First (OSPF) is a routing protocol for Internet Protocol (IP) networks. It uses a link state routing (LSR) algorithm and falls into the group of interior gateway protocols (IGPs), operating within a single autonomous system (AS).

To implement OSPF for a large network, you must first organize the network into logical areas to limit the number of OSPF routers that actively exchange **Link State Advertisements (LSAs)**. You can then define an OSPF interface by assigning an IP interface configured on this switch to one of these groups. This OSPF interface will send and receive OSPF traffic to neighboring OSPF routers. You can further optimize the exchange of OSPF traffic by specifying an area range that covers a large number of subnetwork addresses. This is an important technique for limiting the amount of traffic exchanged between **Area Border Routers (ABRs)**. And finally, you must specify a virtual link to any OSPF area that is not physically attached to the OSPF backbone. Virtual links can also be used to provide a redundant link between contiguous areas to prevent areas from being partitioned, or to merge backbone areas.

Neighbor	Metric
B	8
C	32
D	20

LSA of Router A

4.4.5.1 Global Configuration

This is OSPF router configuration table. It is a general group to configure the OSPF common router parameters. The screen in Figure 4-4-5-1 appears.

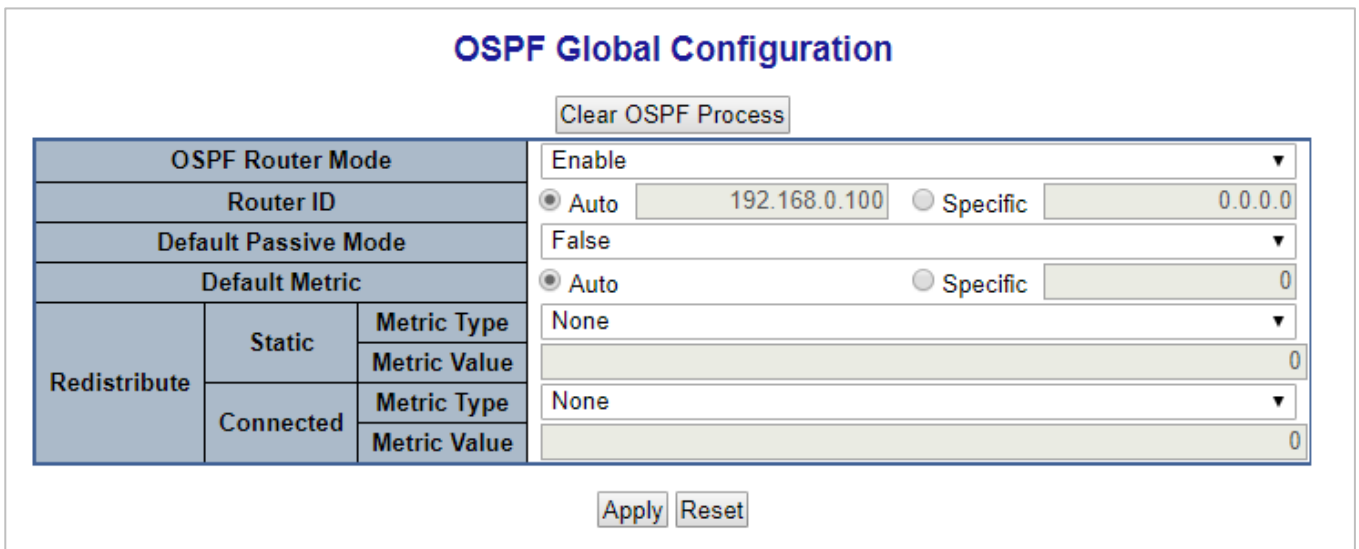

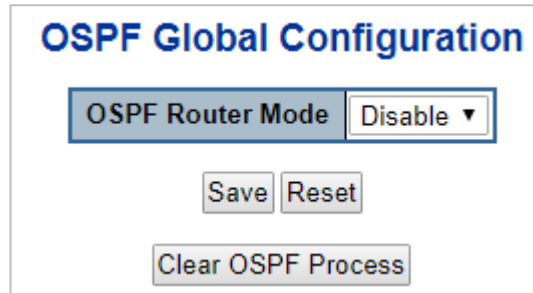

Figure 4-4-5-1: OSPF Global Configuration Page Screenshot

The page includes the following fields:

Object	Description
OSPF Router Mode	Enable/Disable the OSPF router mode.
Router ID	<p>The OSPF Router ID in IPv4 address format(A.B.C.D).</p> <p>When the router's OSPF Router ID is changed, if there is one or more fully adjacent neighbors in current OSPF area, the new router ID will take effect after restart OSPF process. Notice that the router ID should be unique in the Autonomous System and value '0.0.0.0' is invalid since it is reserved for the default algorithm.</p> <ul style="list-style-type: none"> ■ Auto: The default algorithm will choose the largest IP address assigned to the router. ■ Specific: User specified router ID.
Default Passive Mode	Configure all interfaces as passive-interface by default.When an interface is configured as a passive-interface, the OSFP routing updates sending is suppressed, therefore the interface does not establish adjacencies (No OSPF Hellos). The subnet of all interfaces (both passive and active) is advertised by the OSPF router.

<p>Default Metric</p>	<p>User specified default metric value for the OSPF routing protocol. The field is significant only when the argument 'IsSpecificDefMetric' is TRUE</p> <ul style="list-style-type: none"> ■ Auto: The default metric is calculated automatically based on the routing protocols. ■ Specific: User specified default metric.
<p>Static Redistribute Metric Type</p>	<ul style="list-style-type: none"> ■ The OSPF redistributed metric type for the connected interfaces. ■ None: The static routes are not redistributed. ■ Specified Metric Value: User specified metric for the static routes. ■ External Type 1: External Type 1 of the static routes. ■ External Type 2: External Type 2 of the static routes.
<p>Static Redistribute Metric Value</p>	<p>User specified metric value for the connected interfaces. The field is significant only when the argument 'ConnectedRedistMetricType' is configured as 'metricTypeSpecified'.</p> <p>The allowed range is 0 to 1677214.</p>
<p>Connected Redistribute Metric Type</p>	<p>The OSPF redistributed metric type for the static routes.</p> <ul style="list-style-type: none"> ■ None: The connected interfaces are not redistributed. ■ Specified Metric Value: User specified metric for the connected interfaces routes. ■ External Type 1: External Type 1 of the connected interfaces routes. ■ External Type 2: External Type 2 of the connected interfaces routes.
<p>Connected Redistribute Metric Value</p>	<p>User specified metric value for the static routes. The field is significant only when the argument 'StaticRedistMetricType' is configured as 'metricTypeSpecified'.</p> <p>The allowed range is 0 to 1677214.</p>

Buttons

 : Click to reset the current OSPF process.

 : Click to save changes.

 : Click to undo any changes made locally and revert to previously saved values.

4.4.5.2 Network Area

OSPF protocol broadcast messages (i.e., Link State Advertisements) are restricted by area to limit their impact on network performance. Before assigning an Area ID to a specific OSPF interface, you must first specify the Area ID in this table. Each entry in this table identifies a logical group of OSPF routers that actively exchange **Link State Advertisements (LSAs)** to ensure that they share an identical view of the network topology. You can configure the area as a normal one which can send and receive external **Link State Advertisements (LSAs)**, a stubby area that cannot send or receive external LSAs, or a **not-so-stubby area (NSSA)** that can import external route information into its area.

Following is OSPF area configuration table. It is used to specify the OSPF enabled interface(s). When OSPF is enabled on the specific interface(s), the router can provide the network information to the other OSPF routers via those interfaces. The screen in [Figure 4-4-5-2](#) appears.

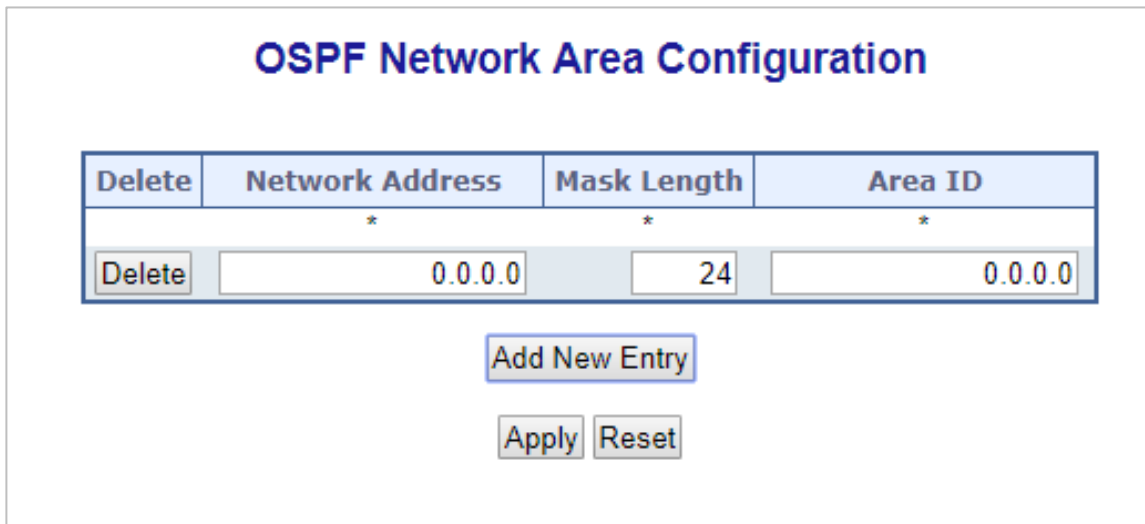

Figure 4-4-5-2: OSPF Network Area Page Screenshot

The page includes the following fields:

Object	Description
Network Address	IPv4 network address.
Mask Length	IPv4 network mask length.
Area ID	The OSPF area ID.

Buttons

Add New Entry : Click to add new entry.

Save : Click to save changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.5.3 Passive Interface

This is OSPF router interface configuration table. The screen in [Figure 4-4-5-3](#) appears.

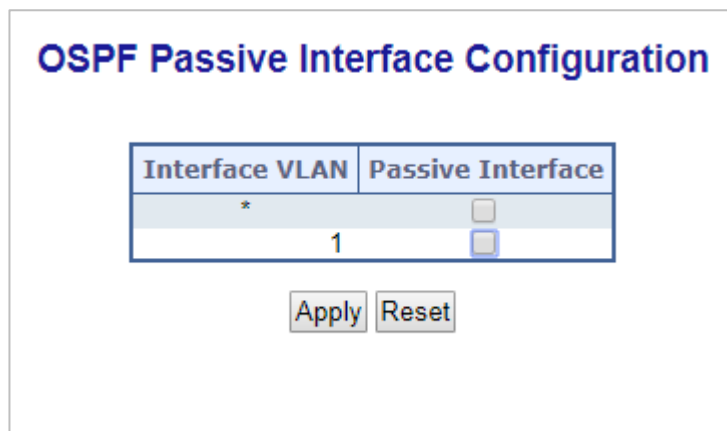

Figure 4-4-5-3: Passive Interface Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Passive Interface	Enable the interface as OSPF passive-interface.

Buttons

Save : Click to save changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.5.4 Stub Area

This is OSPF stub area configuration table. The configuration is used to reduce the link-state database size and therefore the memory and CPU requirement by forbidding some LSAs. The screen in [Figure 4-4-5-4](#) appears.

OSPF Area Stub Configuration

Delete	Area ID	Stub Type	No Summary	Translator Role
*				
No entry exists				

Figure 4-4-5-4: Stub Area Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
No Summary	<p>The value is true means the area is a totally stub area, which summary-LSAs(Type-3) except for the default route and AS-external-LSAs(Type-5) are blocked.</p> <p>The value is false means the area is a stub area, which summary-LSAs(Type-3) except for the default route are blocked.</p>

Buttons

: Click to add new entry.

: Click to save changes.

: Click to undo any changes made locally and revert to previously saved values.

4.4.5.5 Area Authentication

This is OSPF area authentication configuration table. It is used to applied the authentication to all the interfaces belong to the area. The screen in [Figure 4-4-5-5](#) appears.

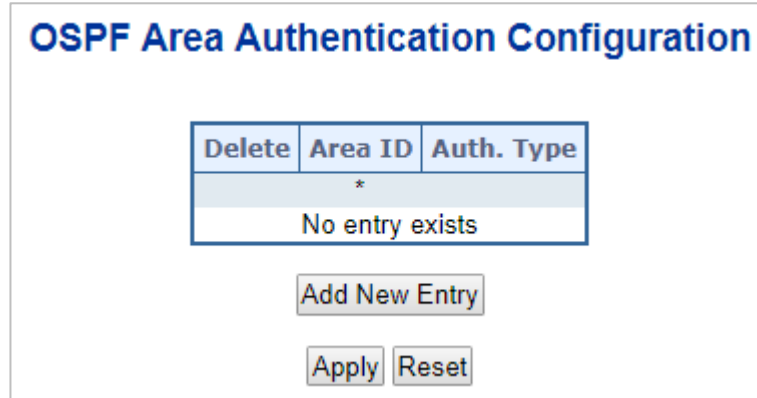

Figure 4-4-5-5: Area Authentication Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
Auth. Type	<p>The authentication type on an area is applied to all the interfaces belong to that area.</p> <p>The authentication type on an IP interface or a virtual link overrides the authentication type on an area and is useful if different interfaces in the same area use different authentication types.</p> <p>Specify the authenticaton type.</p> <p>Simple Password: Simple password authentication.</p> <p>Message Digest: MD5 digest authentication.</p>

Buttons

Add New Entry : Click to add new entry.

Save : Click to save changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.5.6 Area Range

This is OSPF area range configuration table. It is used to summarize the intra area paths from a specific address range in one summary-LSA(Type-3) and advertised to other areas or configure the address range status as 'DoNotAdvertise' which the summary-LSA(Type-3) is suppressed. The area range configuration is used for Area Border Routers (ABRs) and only router-LSAs(Type-1) and network-LSAs (Type-2) can be summarized. The AS-external-LSAs(Type-5) cannot be summarized because the scope is OSPF autonomous system (AS). The AS-external-LSAs(Type-7) cannot be summarized because the feature is not supported yet.. The screen in [Figure 4-4-5-6](#) appears.

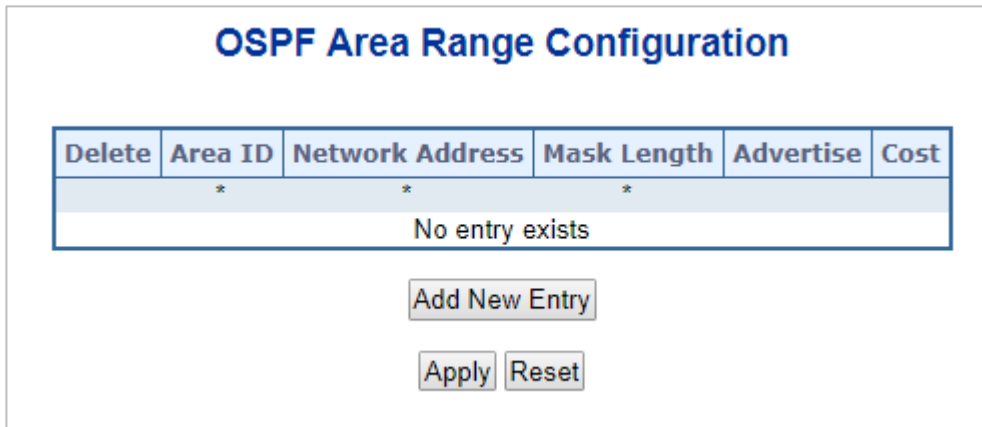

Figure 4-4-5-6: Area Range Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The OSPF area ID.
Network Address	IPv4 network address.
Mask Length	IPv4 network mask length.
Advertised	When the value is true, it summarizes intra area paths from the address range in one summary-LSA(Type-3) and advertised to other areas. Otherwise, the intra area paths from the address range are not advertised to other areas.
Auto/Specific	When 'Auto' is selected, the cost value is set to 0 automatically and isn't allowed to be configured.
Cost	User specified cost (or metric) for this summary route. It is allowed to be configured only when 'Specific' is selected and the allowed range is 0 to 65535.. The allowed range is 1 to 16777215 and the default setting is 'auto cost' mode.

Buttons

Add New Entry : Click to add new entry.

Save : Click to save changes.

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.5.7 Interface Configuration

This is interface configuration parameter table. The screen in [Figure 4-4-5-7](#) appears.

OSPF Interface Configuration

Interface	Priority	Cost	FastHelloPackets	Interval			Auth. Type	Change Simple Password	MD Key			
				Hello	Dead	Retransmit						
*	1	<All>	0	<input type="checkbox"/>	2	10	40	5	<All>	*	*	*
VLAN 1	1	Auto	0	<input type="checkbox"/>	2	10	40	5	Area Configuration	<input type="checkbox"/>		

Figure 4-4-5-7: Interface Configuration Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Priority	User specified router priority for the interface. The allowed range is 0 to 255 and the default value is 1.
Cost	User specified cost for this interface. It's link state metric for the interface. The field is significant only when 'IsSpecificCost' is TRUE. The allowed range is 1 to 65535 and the default setting is 'auto cost' mode.
FastHelloPackets	How many Hello packets will be sent per second. The allowed range is 1 to 10 and the default setting is disabled.

<p>Hello Interval</p>	<p>How many Hello packets will be sent per second.</p> <p>The allowed range is 1 to 65535 and the default value is 10 (seconds).</p> 
<p>Dead Interval</p>	<p>The time interval (in seconds) between hello packets.</p> <p>The allowed range is 1 to 65535 and the default value is 40 (seconds).</p>
<p>Retransmit Interval</p>	<p>The time interval (in seconds) between link-state advertisement(LSA) retransmissions for adjacencies.</p> <p>The allowed range is 1 to 65535 and the default value is 5 (seconds).</p>
<p>Auth. Type</p>	<p>The authentication type.</p> <ul style="list-style-type: none"> ■ Simple Password: It's using a plain text authentication. A password must be configured, but the password can be read by sniffer the packets. ■ Message Digest: It's message-digest algorithm 5 (MD5) authentication. Keying material must also be configured. This is the most secure method. ■ Null Authentication: No authentication. ■ Area Configuration: Refer to Area authentication setting.
<p>Change Simple Password</p>	<p>It is used to change the simple password (fill with plain text). The allowed input length is 1 to 8.</p>
<p>MD Key</p>	<p>Click the icon to edit the message digest key for the entry.</p>

Buttons

 : Click to save changes.

 : Click to undo any changes made locally and revert to previously saved values.

4.4.5.8 Virtual Link

All OSPF areas must connect to the backbone. If an area does not have a direct physical connection to the backbone, you can configure a virtual link that provides a logical path to the backbone. To connect an isolated area to the backbone, the logical path can cross a single nonbackbone area to reach the backbone. To define the path, you must specify one endpoint on the ABR that connects the isolated area to the common nonbackbone area, and the other endpoint on the ABR that connects this common nonbackbone area and the backbone itself. (However, note that you cannot configure a virtual link that runs through a stub or NSSA area.)

Virtual links can also be used to create a redundant link between any area and the backbone to help prevent partitioning, or to connect two existing backbone areas into a common backbone.

To configure a virtual link, specify the transit area through which the endpoint routers connect, and the address of the router on this side of the link.

Following is OSPF virtual link configuration table. The virtual link is established between 2 ABRs to overcome that all the areas have to be connected directly to the backbone area. The screen in [Figure 4-4-5-8](#) appears.

OSPF Virtual Link Configuration

Delete	Area ID	Router ID	Interval			Auth. Type	Change Simple Password	MD Key	
			Hello	Dead	Retransmit				
	*	*					*	*	*
No entry exists									

Figure 4-4-5-8: Virtual Link Page Screenshot

The page includes the following fields:

Object	Description
Area ID	OSPF Area ID.
Router ID	OSPF router ID.

Hello Interval	The time interval (in seconds) between hello packets. The allowed range is 1 to 65535 and the default value is 10 (seconds).
Dead Interval	The number of seconds to wait until the neighbour is declared to be dead. The allowed range is 1 to 65535 and the default value is 40 (seconds).
Retransmit Interval	The time interval (in seconds) between link-state advertisement(LSA) retransmissions for adjacencies. The allowed range is 1 to 65535 and the default value is 5 (seconds).
Auth. Type	<p>The authentication type on an area.</p> <p>Simple Password: It's using a plain text authentication. A password must be configured, but the password can be read by sniffer the packets.</p> <p>Message Digest: It's message-digest algorithm 5 (MD5) authentication. Keying material must also be configured. This is the most secure method.</p> <p>Null Authentication: No authentication.</p> <p>Area Configuration: Refer to Area authentication setting.</p>
Change Simple Password	It is used to change the simple password (fill with plain text). The allowed input length is 1 to 8.
MD Key	Click the icon to edit the message digest key for the entry.

Buttons

 : Click to add new entry.

 : Click to save changes.

 : Click to undo any changes made locally and revert to previously saved values.

4.4.5.9 Global Status

This is OSPF router status table. It is used to provide the OSPF router status information. The screen in [Figure 4-4-5-9](#) appears.

Figure 4-4-5-9: Virtual Link Page Screenshot

The page includes the following fields:

Object	Description
Router ID	OSPF router ID.
SPF Delay	Delay time (in seconds)of SPF calculations.
SPF Hold Time	Minimum hold time (in milliseconds) between consecutive SPF calculations.
SPF Max. Wait Time	Maximum wait time (in milliseconds) between consecutive SPF calculations.
Last Executed SPF Time Stamp	Time (in milliseconds) that has passed between the start of the SPF algorithm execution and the current time.
Min. LSA Interval	Minimum interval (in seconds) between link-state advertisements.
Min. LSA Arrival	Maximum arrival time (in milliseconds) of link-state advertisements.
External LSA Count	Number of external link-state advertisements.
External LSA Checksum	Number of external link-state checksum.
Attached Area Count	Number of areas attached for the router.

Buttons

Clear OSPF Process : Click to reset the current OSPF process.

Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page immediately.

4.4.5.10 Area Status

This is OSPF network area status table. It is used to provide the OSPF network area status information. The screen in Figure 4-4-5-10 appears.

OSPF Area Status														
Auto-refresh <input type="checkbox"/> <input type="button" value="Refresh"/>														
Area ID	Backbone	Area Type	Active Interfaces	Auth. Type	SPF Executed Times	LSA Count	Router LSA		Network LSA		Summary LSA		ASBR Summary LSA	
							Count	Checksum	Count	Checksum	Count	Checksum	Count	Checksum
No entry exists														

Figure 4-4-5-10: Area Status Page Screenshot

The page includes the following fields:

Object	Description
Area ID	The Area ID.
Backbone	Indicate if it's backbone area or not.
Area Type	The area type.
Active Interfaces	Number of active interfaces attached in the area.
Auth. Type	The authentication type in the area.
SPF Executed Times	Number of times SPF algorithm has been executed for the particular area.
LSA Count	Number of the total LSAs for the particular area.
Router LSA Count	Number of the router-LSAs(Type-1) of a given type for the particular area.
Router LSA Checksum	The the router-LSAs(Type-1) checksum.
Network LSA Count	Number of the network-LSAs(Type-2) of a given type for the particular area.
Network LSA Checksum	The the network-LSAs(Type-2) checksum.
Summary LSA Count	Number of the summary-LSAs(Type-3) of a given type for the particular area.
Summary LSA Checksum	The the summary-LSAs(Type-3) checksum.
ASBR Summary LSA Count	Number of the ASBR-summary-LSAs(Type-4) of a given type for the particular area.
ASBR Summary LSA Checksum	The the ASBR-summary-LSAs(Type-4) checksum.

Buttons

Click to refresh the page immediately.

4.4.5.11 Neighbor Status

This is OSPF IPv4 neighbor status table. It is used to provide the OSPF neighbor status information. The screen in Figure 4-4-5-11 appears.

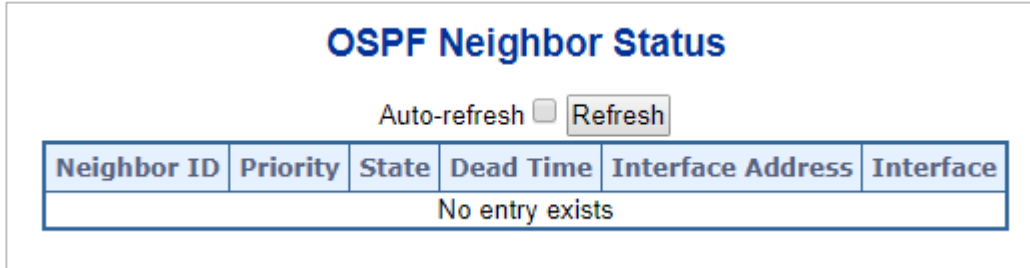

Figure 4-4-5-11: Neighbor Status Page Screenshot

The page includes the following fields:

Object	Description
Neighbor ID	The Neighbor ID.
Priority	The priority of OSPF neighbor. It indicates the priority of the neighbor router. This item is used when selecting the DR for the network. The router with the highest priority becomes the DR.
State	The state of OSPF neighbor. It indicates the functional state of the neighbor router.
Dead Time	Dead timer. It indicates the amount of time remaining that the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down.
Interface Address	The IP address.
Interface	The network interface.

Buttons

Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page immediately.

4.4.5.12 Interface Status

This is OSPF interface status table. It is used to provide the OSPF interface status information. The screen in Figure 4-4-5-12 appears.

OSPF Interface Status																			
Auto-refresh <input type="checkbox"/> Refresh																			
Interface	Interface Address	Area ID	Router ID	State	DR		BDR		Pri	Cost	Interval Configuration(sec)				Hello Timer	Nbr Count	Adjacent Nbr Count	Passive	Transmit Delay
					ID	Address	ID	Address			Hello	Dead	Wait	Retransmit					
No entry exists																			

Figure 4-4-5-12: Interface Status Page Screenshot

The page includes the following fields:

Object	Description
Interface	Interface identification.
Interface Address	IPv4 network address.
Area ID	The OSPF area ID.
Router ID	The OSPF router ID.
State	The state of the link.
DR ID	The router ID of DR.
DR Address	The IP address of DR.
BDR ID	The router ID of BDR.
BDR Address	The IP address of BDR.
Priority	The OSPF priority. It helps determine the DR and BDR on the network to which this interface is connected.
Cost	The cost of the interface.
Hello	Hello timer. A time interval that a router sends an OSPF hello packet.
Dead	Dead timer. Dead timer is a time interval to wait before declaring a neighbor dead. The unit of time is the second.
Wait	This interval is used in Wait Timer. Wait timer is a single shot timer that causes the interface to exit waiting and select a DR on the network. Wait Time interval is the same as Dead time interval.
Retransmit	Retransmit timer. A time interval to wait before retransmitting a database description packet when it has not been acknowledged.
Hello Timer	Hello due timer. An OSPF hello packet will be sent on this interface after this due time.

Nbr Count	Neighbor count. This is the number of OSPF neighbors discovered on this interface.
Adjacent Nbr Count	Adjacent neighbor count. This is the number of routers running OSPF that are fully adjacent with this router.
Passive	Indicate if the interface is passive interface.
Transmit Delay	The estimated time to transmit a link-state update packet on the interface.

Buttons

4.4.8 OSPFv3

4.4.8.1 Global Configuration

This is OSPF6 router configuration table. It is a general group to configure the OSPF6 common router parameters.

OSPF6 Global Configuration

OSPF6 Router Mode

The displayed settings are:

Object	Description
<ul style="list-style-type: none"> • OSPF6 Router Mode 	Enable/Disable the OSPF6 router mode.
<ul style="list-style-type: none"> • Default Router ID 	<p>The OSPF6 Router ID in IPv4 address format(A.B.C.D).</p> <p>When the router's OSPF6 Router ID is changed, if there is one or more fully adjacent neighbors in current OSPF6 area, the new router ID will take effect after restart OSPF6 process. Notice that the router ID should be unique in the Autonomous System and value '0.0.0.0' is invalid since it is reserved for the default algorithm.</p> <p>Auto: The default algorithm will choose the largest IP address assigned to the router.</p> <p>Specific: User specified router ID.</p> <p>The allowed range is from 0.0.0.1 to 255.255.255.254.</p>
<ul style="list-style-type: none"> • Static Redistribute 	<p>Static Redistribute</p> <p>The OSPF redistribute enabled for the static routes or not.</p> <p>Enable: The static routes are redistributed.</p> <p>Disable: The static routes are not redistributed</p>
<ul style="list-style-type: none"> • Connected Redistribute 	<p>The OSPF redistribute enabled for connected route or not.</p> <p>Enable: The connected interfaces are redistributed.</p> <p>Disbale: The connected interfaces are not redistributed.</p>
<ul style="list-style-type: none"> • Administrative instance 	The OSPF6 administrative distance.

Buttons

: Click to reset the current OSPF6 process.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.8.2 Passive Interface

This is OSPF6 router interface configuration table.

OSPF6 Passive Interface Configuration

Interface	Area ID
No entry exists	

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Interface Area ID	The OSPF6 interface Area ID. Only valid if 'is_specific_id' is true

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.8.3 Stub Area

This is OSPF6 stub area configuration table. The configuration is used to reduce the link-state database size and therefore the memory and CPU requirement by forbidding some LSAs.

OSPF6 Area Stub Configuration

Delete	Area ID	No Summary
*		
No entry exists		

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Area ID	The OSPF6 area ID.
• No Summary	The value is true to configure the inter-area routes do not inject into this stub area.

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.8.4 Area Range

This is OSPF6 area range configuration table. It is used to summarize the intra area paths from a specific address range in one summary-LSA(Type-0x2003) and advertised to other areas or configure the address range status as 'DoNotAdvertise' which the summary-LSA(Type-0x2003) is suppressed. The area range configuration is used for Area Border Routers (ABRs) and only router-LSAs(Type-0x2001) and network-LSAs (Type-0x2002) can be summarized. The AS-external-LSAs(Type-0x4005) cannot be summarized because the scope is OSPF6 autonomous system (AS). The AS-external-LSAs(Type-0x4007) cannot be summarized because the feature is not supported yet

OSPF6 Area Range Configuration

Delete	Area ID	Network Address	Mask Length	Advertise	Cost
	*	*	*		
No entry exists					

Add New Entry

Save Reset

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Area ID	The OSPF6 area ID.
• Network Address	IPv6 network address.
• Mask Length	IPv6 network mask length.
• Advertised	When the value is true, it summarizes intra area paths from the address range in one Inter-Area Prefix LSA(Type-0x2003) and advertised to other areas. Otherwise, the intra area paths from the address range are not advertised to other areas.
• Auto/Specific	When 'Auto' is selected, the cost value is set to 0 automatically and isn't allowed to be configured.
• Cost	User specified cost (or metric) for this summary route. It is allowed to be configured only when 'Specific' is selected. The allowed range is 0 to 16777215 and the default setting is 'auto cost' mode.

Buttons

Add New Entry : Click to add new entry.

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.8.5 Interfaces Configuration

This is interface configuration parameter table.

OSPF6 Interface Configuration

Interface	Priority	Passive Interface	Cost		Interval		
					Hello	Dead	Retransmit
*	<input type="text" value="1"/>	<input type="checkbox"/>	<input type="text" value="<>"/>	<input type="text" value="1"/>	<input type="text" value="10"/>	<input type="text" value="40"/>	<input type="text" value="5"/>
VLAN 1	<input type="text" value="1"/>	<input type="checkbox"/>	Auto	<input type="text" value="1"/>	<input type="text" value="10"/>	<input type="text" value="40"/>	<input type="text" value="5"/>

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Priority	User specified router priority for the interface. The allowed range is 0 to 255 and the default value is 1.
• Passive Interface	Indicates whether the interface is passive or not
• Cost	User specified cost for this interface. It's link state metric for the interface. The field is significant only when 'IsSpecificCost' is TRUE. The allowed range is 1 to 65535 and the default setting is 'auto cost' mode.
• Hello Interval	How many Hello packets will be sent per second. The allowed range is 1 to 65535 and the default value is 10 (seconds).
• Dead Interval	The time interval (in seconds) between hello packets. The allowed range is 1 to 65535 and the default value is 40 (seconds).
• Retransmit Interval	The time interval (in seconds) between link-state advertisement(LSA) retransmissions for adjacencies. The allowed range is 3 to 65535 and the default value is 5 (seconds).

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.8.6 Global Status

This is OSPF6 router status table. It is used to provide the OSPF6 router status information.

OSPF6 Global Status

Auto-refresh

OSPF6 is disabled

The displayed settings are:

Object	Description
• Router ID	OSPF6 router ID.
• SPF Delay	Delay time (in seconds)of SPF calculations.
• SPF Hold Time	Minimum hold time (in milliseconds) between consecutive SPF calculations.
• SPF Max. Wait Time	Maximum wait time (in milliseconds) between consecutive SPF calculations
• Last Executed SPF Time Stamp	Time (in milliseconds) that has passed between the start of the SPF algorithm execution and the current time.
• Attached Area Count	Number of areas attached for the router.

Buttons

: Click to reset the current OSPF6 process.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

4.4.8.7 Area Status

This is OSPF6 network area status table. It is used to provide the OSPF6 network area status information.

OSPF6 Area Status

Auto-refresh

Area ID	Backbone	Area Type	Active Interfaces	SPF Executed Times	LSA Count
No entry exists					

The displayed settings are:

Object	Description
• Area ID	The Area ID.
• Backbone	Indicate if it's backbone area or not.
• Area Type	The area type.
• Active Interfaces	Number of active interfaces attached in the area.
• SPF Executed Times	Number of times SPF algorithm has been executed for the particular area.
• LSA Count	Number of the total LSAs for the particular area.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

4.4.8.8 Neighbor Status

This is OSPF6 IPv6 neighbor status table. It is used to provide the OSPF6 neighbor status information.

OSPF6 Neighbor Status

Auto-refresh Refresh

Neighbor ID	Priority	State	Dead Time	Interface Address	Interface
No entry exists					

The displayed settings are:

Object	Description
• Neighbor ID	The Neighbor ID.
• Priority	The priority of OSPF6 neighbor. It indicates the priority of the neighbor router. This item is used when selecting the DR for the network. The router with the highest priority becomes the DR.
• State	The state of OSPF6 neighbor. It indicates the functional state of the neighbor router.
• Dead Time	Dead timer. It indicates the amount of time remaining that the router waits to receive an OSPF6 hello packet from the neighbor before declaring the neighbor down.
• Interface Address	The IP address.
• Interface	The network interface.
• efault	To set the switch port to use the default VL

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

4.4.8.9 Interface Status

This is OSPF6 interface status table. It is used to provide the OSPF6 interface status information.

OSPF6 Interface Status

Auto-refresh Refresh

Interface	Interface Address	Area ID	Router ID	State	DR	BDR	Pri	Cost	Interval Configuration(sec)			Passive	Transmit Delay
					ID	ID			Hello	Dead	Retransmit		
No entry exists													

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Interface Address	IPv6 network address.
• Area ID	The OSPF6 area ID.
• Router ID	The OSPF6 router ID.
• State	The state of the link.
• DR ID	The router ID of DR.
• BDR ID	The router ID of BDR.
• Priority	The OSPF6 priority. It helps determine the DR and BDR on the network to which this interface is connected.
• Cost	The cost of the interface.
• Hello	Hello timer. A time interval that a router sends an OSPF6 hello packet.
• Dead	Dead timer. Dead timer is a time interval to wait before declaring a neighbor dead. The unit of time is the second.
• Retransmit	Retransmit timer. A time interval to wait before retransmitting a database description packet when it has not been acknowledged.
Passive	Indicate if the interface is passive interface.
Transmit Delay	The estimated time to transmit a link-state update packet on the interface.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

4.4.8.10 Routing Status

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from ID" input field allow the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

OSPF6 Routing Status

Start from Route Type Destination / Area NextHop with entries per page.

Codes: i - Intra-area Router Path, I - Inter-area Router Path

0 - 0 of 0 entry Auto-refresh Refresh << << >> >>

Route Type	Destination	Area	NextHop	Cost	AS Cost	Border Router Type	Interface	IsConnected
No entry exists								

The displayed settings are:

Object	Description
<ul style="list-style-type: none"> • Route Type 	<p>The OSPF6 route type.</p> <p>Intra Area: The destination is an OSPF6 route which is located on intra-area.</p> <p>Inter Area: The destination is an OSPF6 route which is located on inter-area.</p> <p>Border Router: The destination is a border router.</p> <p>External Type-1: The destination is an external Type-1 route.</p> <p>External Type-2: The destination is an external Type-2 route.</p>
<ul style="list-style-type: none"> • Destination 	Network and prefix (example 10.0.0.0/16) of the given route entry.
<ul style="list-style-type: none"> • Area 	It indicates which area the route or router can be reached via/to.
<ul style="list-style-type: none"> • NextHop 	An Ipv6 address represented as human readable text as specified in RFC5952
<ul style="list-style-type: none"> • Cost 	The cost of the route.
<ul style="list-style-type: none"> • AS Cost 	The cost of the route within the OSPF6 network. It is valid for external Type-2 route and always '0' for other route type.
<ul style="list-style-type: none"> • Border Router Type 	<p>The border router type of the OSPF6 route entry.</p> <p>i-ABR: The border router is an ABR.</p> <p>i-ASBR: The border router is an ASBR located on Intra-area.</p> <p>I-ASBR: The border router is an ASBR located on Inter-area.</p> <p>i-ABR/ASBR: The border router is an ASBR attached to at least 2 areas.</p>

• Interface	The interface where the ip packet is outgoing.
• IsConnected	The destination is connected directly or not.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table entries, starting from the first available entry. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the entry prior to the first entry currently displayed. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, starting from the entry next to the last entry currently displayed. If the last entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the last available entry. If the last entry of the table is displayed, the button is disabled.

4.4.9 OSPFv3 Database

4.4.9.1 General Database

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

OSPF6 Link State Database

Start from Area ID , Link State Type , Link State ID , Advertising Router with entries per page.

0 - 0 of 0 entry Auto-refresh Refresh << << >> >>

Area ID	Link State Type	Link State ID	Advertising Router	Age (in seconds)	Sequence
No entry exists					

The displayed settings are:

Object	Description
• Area ID	The OSPF6 area ID of the link state advertisement. It is not required for external LSA.
• Link State Type	The type of the link state advertisement.
• Link State ID	The OSPF6 link state ID. It identifies the piece of the routing domain that is being described by the LSA.
• Advertising Router	The advertising router ID which originated the LSA.
• Age	The time in seconds since the LSA was originated.
• Sequence	The LS sequence number of the LSA.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • Neighbor Address 	Ipv4 address encoded as "a.b.c.d", where a-d is a base-10 human readable integer in the range [0-255]The neighbor address can be an unicast(excluding loopback), broadcast, or network IP address.

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.11.4 Passive Interface Configuration

This is RIP router interface configuration table.

RIP Passive Interface Configuration

Interface	Passive Interface
*	
No entry exists	

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Passive Interface	Enable the interface as RIP passive-interface.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.11.5 Offset-list Configuration

This is RIP offset-list configuration table. The maximum number of the RIP offset-list entries is 130.

RIP Offset-List Configuration

Delete	VLAN ID	Direction	Access List Name	Offset Metric
*	*	*	*	*
No entry exists				

Add New Entry

Save Reset

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• VLAN ID	The VLAN interface which the offset list applies to. The range of VLAN ID is from 0 to 4095. 0 means that the offset list applies to all interfaces.
• Direction	The direction to add the offset to routing metric update. In: Apply to the inbound direction. Out: Apply to the outbound direction.
• Access List Name	Access-list name. The valid name string length is from 1 to 31 and allows all printable characters excluding space character.
• Offset Metric	The offset to incoming or outgoing routing metric. The allowed range is 0 to 16.

Buttons

Add New Entry : Click to add new entry.

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

4.4.11.6 Global Status

This indicates the global rip version. By default, the router sends RIPv2 and accepts both RIPv1 and RIPv2. When the router receive either version of REQUESTS or triggered updates packets, it replies with the appropriate version. Be aware that the RIP network class configuration when RIPv1 is involved in the topology. RIPv1 uses classful routing, the subnet information is not included in the routing updates. The limitation makes it impossible to have different-sized subnets inside of the same network class. In other words, all subnets in a network class must have the same size..

RIP Global Status

Clear RIP Process Auto-refresh Refresh

Status Information
RIP Router Mode Disabled

The displayed settings are:

Object	Description
• Update Timer	The timer interval (in seconds) between the router sends the complete routing table to all neighboring RIP routers
• Invalid Timer	The invalid timer is the number of seconds after which a route will be marked invalid.
• Garbage-Collection Timer	The garbage collection timer is the number of seconds after which a route will be deleted.
• Next Update Time	Specifies when the next round of updates will be sent out from this router in seconds.
• Redistribute Default Metric	This indicates the default metric value of redistributed routes.
• Redistribute Connected	This indicates the connected route is redistributed or not.
• Redistribute Static	This indicates the static route is redistributed or not.
• Redistribute OSPF	This indicates the OSPF route is redistributed or not.
• Administrative Distance	This indicates administrative distance value

Buttons

Clear RIP Process : Click to reset the current RIP process.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Click to refresh the page immediately.

4.4.11.7 Interface Status

The RIP interface status information table.

RIP Interface Status

Auto-refresh

Interface	Send Version	Receive Version	Triggered Update	Passive	Auth. Type	Key-Chain Name
No entry exists						

The displayed settings are:

Object	Description
• Interface	Interface identification.
• Send Version	The RIP version for the advertisement transmission on the interface.
• Receive Version	The RIP version for the advertisement reception on the interface.
• Triggered Update	This indicates the interface enable triggered update or not.
• Passive	This indicates if the passive-interface is active on the interface or not.
• Key-Chain Name	This indicates the interface is associate with a specific key-chain name.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

4.4.11.8 Peer Information

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

RIP Peer Information

Start from Address with entries per page.

0 - 0 of 0 entry Auto-refresh

Gateway	Last Update Time	Version	Received Bad Packets	Received Bad Routes
No entry exists				

The displayed settings are:

Object	Description
• Gateway	Peer IPv4 address.
• Version	The RIP version number in the header of the last RIP packet received from the neighbor.
• Last Update Time	The time duration in seconds from the time the last RIP packet received from the neighbor to now.
• Received Bad Packets	The number of RIP response packets from the neighbor discarded as invalid.
• Received Bad Routes	The number of routes from the neighbor that were ignored because they were invalid.

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table entries, starting from the first available entry. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the entry prior to the first entry currently displayed. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, starting from the entry next to the last entry currently displayed. If the last entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the last available entry.

4.4.11.9 Database

Each page shows up to 999 table entries, selected through the "entries per page" input field. When first visited, the web page will show the beginning entries of this table.

The "Start from entry keys" input field allows the user to change the starting point in this table. Clicking the button will update the displayed table starting from that or the closest next entry match.

In addition, these input fields will upon a button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start input field.

RIP Database Information

Start from Network / , Next Hop with entries per page.

0 - 0 of 0 entry Auto-refresh Refresh <<< << >> >>>

Type	Sub-Type	Network	Next Hop	Metric	From	External Metric	Tag	Uptime
No entry exists								

The displayed settings are:

Object	Description
• Type	The protocol type of the route.
• Sub-Type	The protocol sub-type of the route.
• Network	The destination IP address and mask of the route.
• Next Hop	The first gateway along the route to the destination.
• Metric	The metric of the route
• From	This indicates the route is learned an IP address or generated from one of the local interfaces
• External Metric	The field is significant only when the route is redistributed from other protocol type, for example, OSPF. This indicates the metric value from the original redistributed source.
• Tag	The tag of the route. It is used to provide a method of separating 'internal' RIP routes, which may have been imported from an EGP (Exterior gateway protocol) or another IGP (Interior gateway protocol). For example, routes imported from OSPF can have a route tag value which the other routing protocols can use to prevent advertising the same route back to the original protocol routing domain.

<ul style="list-style-type: none"> • Uptime 	<p>The time field is significant only when the route is learned from the neighbors.</p> <p>When the route destination is reachable (its metric value less than 16), the time field means the invalid time of the route. When the route destination is unreachable (its metric value great than 16), the time field means the garbage-collection time of the route.</p>
-------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Buttons

: Click to refresh the page immediately.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Updates the table entries, starting from the first available entry. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the entry prior to the first entry currently displayed. If the first entry of the table is displayed, the button is disabled.

: Updates the table entries, starting from the entry next to the last entry currently displayed. If the last entry of the table is displayed, the button is disabled.

: Updates the table entries, ending at the last available entry.

4.4.12 Router

4.4.12.1 Key-Chain

This is router key chain name table. The maximum number of the router key-chain name entries is 64.

Router Key-Chain Configuration

Delete	Key Chain Name	Key ID
	*	*
No entry exists		

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Key Chain Name	The name of the key-chain entry. The valid name string length is from 1 to 31 and allows all printable characters excluding space character.
• Key ID	Click the icon to edit the key

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.12.2 Key-Chain Key ID

This is router key chain key ID configuration table.

Router Key-Chain Key IDs Configuration

VLAN ID

Delete	Key Chain Name	Key ID	Change Key String
*	*	*	*
No entry exists			

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Key Chain Name	The name of the key-chain entry. The valid name string length is from 1 to 31 and allows all printable characters excluding space character.
• Key ID	The key chain key ID. The valid range is from 1 to 255.
• Change Key String	The key string. It is used to change the key string (fill with plain text). The valid string length is from 1 to 63.

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.4.12.3 Access-list

This is router access-list configuration table. The maximum number of the router access-list entries is 130.

Router Access-List Configuration

Delete	Name	Mode	Network Address	Mask Length
	*	*	*	*
No entry exists				

The displayed settings are:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Name	The name of the key-chain entry. The valid name string length is from 1 to 31 and allows all printable characters excluding space character.
• Mode	The access right mode of the access-list entry. Permit: Permit the access right. Deny: Deny the access right.
• Network Address	The IPv4 address of the access-list entry.
• Mask Length	The network prefix size of the access-list entry.

Buttons

: Click to add new entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.5 QoS

4.5.1 General

Quality of Service (QoS) is an advanced traffic prioritization feature that allows you to establish control over network traffic. QoS enables you to assign various grades of network service to different types of traffic, such as multi-media, video, protocol-specific, time critical, and file-backup traffic.

QoS reduces bandwidth limitations, delay, loss, and jitter. It also provides increased reliability for delivery of your data and allows you to prioritize certain applications across your network. You can define exactly how you want the switch to treat selected applications and types of traffic. You can use QoS on your system to:

- Control a wide variety of network traffic by:
- Classifying traffic based on packet attributes.
- Assigning priorities to traffic (for example, to set higher priorities to time-critical or business-critical applications).
- Applying security policy through traffic filtering.
- Provide predictable throughput for multimedia applications such as video conferencing or voice over IP by minimizing delay and jitter.
- Improve performance for specific types of traffic and preserve performance as the amount of traffic grows.
- Reduce the need to constantly add bandwidth to the network.
- Manage network congestion.

QoS Terminology

- **Classifier** – classifies the traffic on the network. Traffic classifications are determined by protocol, application, source, destination, and so on. You can create and modify classifications. The Switch then groups classified traffic in order to schedule them with the appropriate service level.
- **DiffServ Code Point (DSCP)** – is the traffic prioritization bits within an IP header that are encoded by certain applications and/or devices to indicate the level of service required by the packet across a network.
- **Service Level** – defines the priority that will be given to a set of classified traffic. You can create and modify service levels.
- **Policy** – comprises a set of “rules” that are applied to a network so that a network meets the needs of the business. That is, traffic can be prioritized across a network according to its importance to that particular business type.
- **QoS Profile** – consists of multiple sets of rules (classifier plus service level combinations). The QoS profile is assigned to a port(s).
- **Rules** – comprises a service level and a classifier to define how the Switch will treat certain types of traffic. Rules are associated with a QoS Profile (see above).

To implement QoS on your network, you need to carry out the following actions:

1. Define a service level to determine the priority that will be applied to traffic.
2. Apply a classifier to determine how the incoming traffic will be classified and thus treated by the Switch.
3. Create a QoS profile which associates a service level and a classifier.
4. Apply a QoS profile to a port(s).

4.5.1.1 Port Classification

This page allows you to configure the basic QoS Classification settings for all switch ports. The Port classification screen in [Figure 4-5-1-1](#) appears.

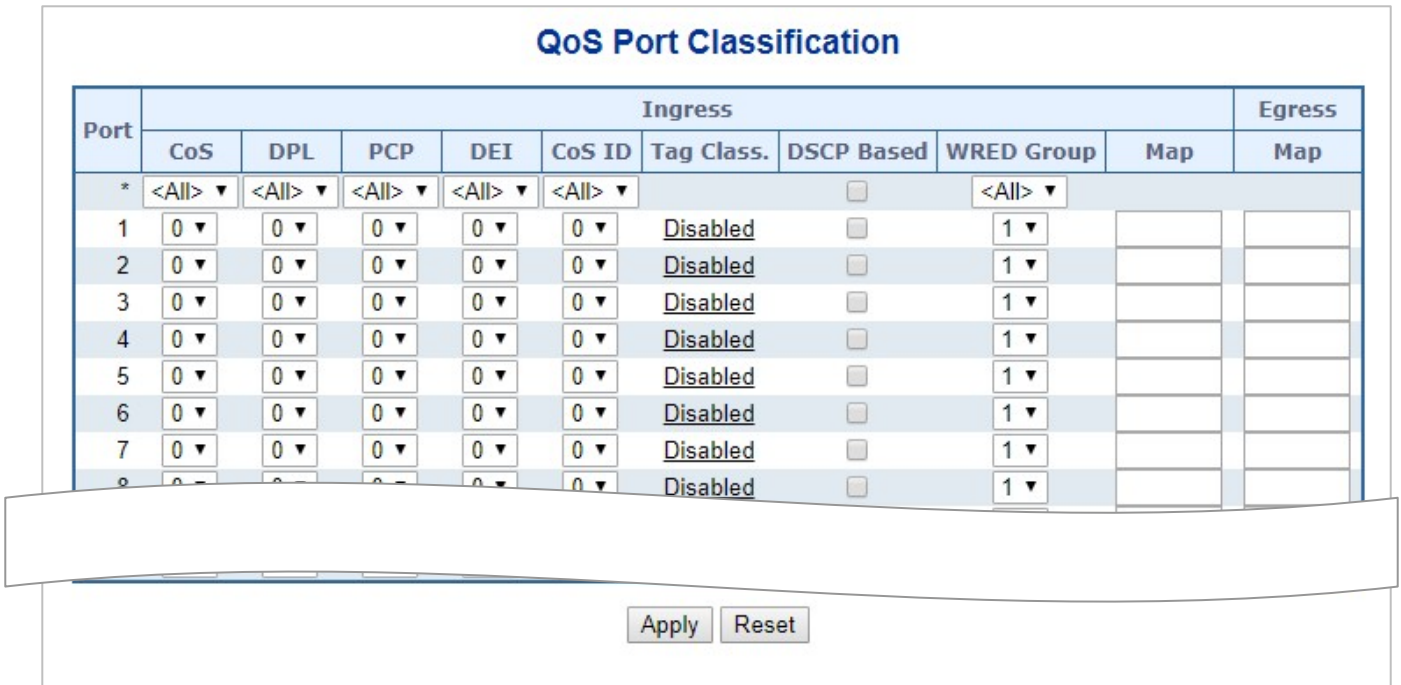

Figure 4-5-1-1: QoS Ingress Port Policers Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port 	The port number for which the configuration below applies.
<ul style="list-style-type: none"> • CoS 	<p>Controls the default CoS value.</p> <p>All frames are classified to a CoS. There is a one to one mapping between CoS, queue and priority. A CoS of 0 (zero) has the lowest priority.</p> <p>The classified CoS can be overruled by a QCL entry.</p> <p>Note: If the default CoS has been dynamically changed, then the actual default CoS is shown in parentheses after the configured default CoS.</p>
<ul style="list-style-type: none"> • DPL 	<p>Controls the default DPL value.</p> <p>All frames are classified to a Drop Precedence Level.</p> <p>The classified DPL can be overruled by a QCL entry.</p>

<ul style="list-style-type: none"> • PCP 	<p>Controls the default PCP value.</p> <p>All frames are classified to a PCP value.</p> <p>If the port is VLAN aware and the frame is tagged, then the frame is classified to the PCP value in the tag. Otherwise the frame is classified to the default PCP value.</p>
<ul style="list-style-type: none"> • DEI 	<p>Controls the default DEI value.</p> <p>All frames are classified to a DEI value.</p> <p>If the port is VLAN aware and the frame is tagged, then the frame is classified to the DEI value in the tag. Otherwise the frame is classified to the default DEI value.</p>
<ul style="list-style-type: none"> • CoS ID 	<p>Controls the default CoS ID value.</p> <p>Every incoming frame is classified to a CoS ID, which later can be used as basis for rewriting of different parts of the frame.</p>
<ul style="list-style-type: none"> • Tag Class. 	<p>Shows the classification mode for tagged frames on this port.</p> <p>Disabled: Use default CoS and DPL for tagged frames.</p> <p>Enabled: Use mapped versions of PCP and DEI for tagged frames.</p> <p>Click on the mode in order to configure the mode and/or mapping.</p> <p>Note: This setting has no effect if the port is VLAN unaware. Tagged frames received on VLAN unaware ports are always classified to the default CoS and DPL.</p>
<ul style="list-style-type: none"> • DSCP Based 	<p>Click to Enable DSCP Based QoS Ingress Port Classification.</p>
<ul style="list-style-type: none"> • WRED Group 	<p>Controls the WRED group membership.</p>
<ul style="list-style-type: none"> • Ingress Map 	<p>Controls the Ingress Map selection through the Map ID. The Ingress Map ID ranges from 0 to 255. An empty field indicates no map selection.</p>
<ul style="list-style-type: none"> • Egress Map 	<p>Controls the Egress Map selection through the Map ID. The Egress Map ID ranges from 0 to 511. An empty field indicates no map selection</p>

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.5.1.2 Queue Policing

This page allows you to configure the Queue Policer settings for all switch ports.. The Queue Policing screen in [Figure 4-5-1-2](#) appears.

QoS Ingress Queue Policers

Port	Queue 0	Queue 1	Queue 2	Queue 3	Queue 4	Queue 5	Queue 6	Queue 7
	Enable	Enable	Enable	Enable	Enable	Enable	Enable	Enable
*	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Figure 4-5-1-2 : QoS Ingress Port Classification Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port number for which the configuration below applies.
• Enable (E)	Enable or disable the queue policer for this switch port.
• Rate	Controls the rate for the queue policer. This value is restricted to 25-13128147 when "Unit" is kbps, and 1-13128 when "Unit" is Mbps. The rate is internally rounded up to the nearest value supported by the queue policer. This field is only shown if at least one of the queue policers are enabled.
• Unit	Controls the unit of measure for the queue policer rate as kbps or Mbps. This field is only shown if at least one of the queue policers are enabled.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.5.1.3 Port Tag Remarking

This page provides an overview of [QoS](#) Egress Port Tag Remarking for all switch ports. The Port tag remarking screen in [Figure 4-5-1-3](#) appears.

Port	Mode
1	Classified
2	Classified
3	Classified
4	Classified
5	Classified
6	Classified
7	Classified
8	Classified

Figure 4-5-1-3: Port Tag Remarking Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port 	<p>he logical port for the settings contained in the same row.</p> <p>Click on the port number in order to configure tag remarking</p>
<ul style="list-style-type: none"> • Mode 	<p>Shows the tag remarking mode for this port.</p> <p>Classified: Use classified PCP/DEI values.</p> <p>Default: Use default PCP/DEI values.</p> <p>Mapped: Use mapped versions of CoS and DPL.</p>

4.5.1.4 Statistics

This page provides statistics for the different queues for all switch ports. The statistic screen in [Figure 4-5-1-5](#) appears.

Port	Q0		Q1		Q2		Q3		Q4		Q5		Q6		Q7		
	Rx	Tx	Rx	Tx	Rx	Tx	Rx	Tx	Rx	Tx	Rx	Tx	Rx	Tx	Rx	Tx	
1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
2	26828	6284130	0	0	0	0	0	0	0	0	0	0	0	0	0	0	2244
3	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
4	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
5	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
6	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
7	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Figure 4-5-1-5: QoS statistics Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings contained in the same row.
• Qn	There are 8 QoS queues per port. Q0 is the lowest priority queue.
• Rx/Tx	The number of received and transmitted packets per queue.

Buttons

Refresh : Click to refresh the page immediately.

 : Click to undo any changes made locally and revert to previously saved values.

4.5.2.2 Port Scheduler

The Port Scheduler and Shapers for a specific port are configured on this page. The QoS Egress Port Schedule and Shaper screen in [Figure 4-5-2-2](#) appears.

QoS Egress Port Schedulers

Port	Mode	Weight							
		Q0	Q1	Q2	Q3	Q4	Q5	Q6	Q7
<u>1</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>2</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>3</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>4</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>5</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>6</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>7</u>	Strict Priority	-	-	-	-	-	-	-	-
<u>8</u>	Strict Priority	-	-	-	-	-	-	-	-

Port 1

QoS Egress Port Scheduler and Shapers Port 1

Scheduler Mode: Strict Priority

Queue Shaper				Port Shaper		
Enable	Rate	Unit	Excess	Enable	Rate	Unit
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>	500	kbps
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		
<input type="checkbox"/>	500	kbps	<input type="checkbox"/>	<input type="checkbox"/>		

The diagram illustrates the data flow from eight queues (Q0 through Q7) into a central vertical oval labeled "STRICT". Each queue is represented by a small circle with an 'S' and an arrow pointing towards the "STRICT" oval. From the right side of the "STRICT" oval, an arrow points to a "Port Shaper" block. This block contains a rate setting of "500" and a unit of "kbps".

Figure 4-5-2-2: QoS Egress Port Schedule and Shapers Page Screenshot

The page includes the following fields:

Object	Description
• Schedule Mode	Controls whether the scheduler mode is " Strict Priority " or " Weighted " on this switch port.
• Queue Shaper Enable	Controls whether the queue shaper is enabled for this queue on this switch port.
• Queue Shaper Rate	Controls the rate for the queue shaper. This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is restricted to 1-13200 when the "Unit" is "Mbps". The default value is 500 .
• Queue Shaper Unit	Controls the unit of measure for the queue shaper rate as " kbps " or " Mbps ". The default value is "kbps".
• Queue Shaper Excess	Controls whether the queue is allowed to use excess bandwidth.
• Queue Scheduler Weight	Controls the weight for this queue. This value is restricted to 1-100. This parameter is only shown if "Scheduler Mode" is set to " Weighted ". The default value is " 17 ".
• Queue Scheduler Percent	Shows the weight in percent for this queue. This parameter is only shown if "Scheduler Mode" is set to "Weighted".
• Port Shaper Enable	Controls whether the port shaper is enabled for this switch port.
• Port Shaper Rate	Controls the rate for the port shaper. This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is restricted to 1-13200 when the "Unit" is "Mbps". The default value is 500.
• Port Shaper Unit	Controls the unit of measure for the port shaper rate as "kbps" or "Mbps". The default value is "kbps".

Figure 4-5-2-3: QoS Egress Port Schedule and Shapers Page Screenshot

The page includes the following fields:

Object	Description
• Schedule Mode	Controls whether the scheduler mode is " Strict Priority " or " Weighted " on this switch port.
• Queue Shaper Enable	Controls whether the queue shaper is enabled for this queue on this switch port.
• Queue Shaper Rate	Controls the rate for the queue shaper. This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is restricted to 1-13200 when the "Unit" is "Mbps". The default value is 500 .
• Queue Shaper Unit	Controls the unit of measure for the queue shaper rate as " kbps " or " Mbps ". The default value is "kbps".
• Queue Shaper Excess	Controls whether the queue is allowed to use excess bandwidth.
• Queue Scheduler Weight	Controls the weight for this queue. This value is restricted to 1-100. This parameter is only shown if "Scheduler Mode" is set to " Weighted ". The default value is " 17 ".
• Queue Scheduler Percent	Shows the weight in percent for this queue. This parameter is only shown if "Scheduler Mode" is set to "Weighted".
• Port Shaper Enable	Controls whether the port shaper is enabled for this switch port.
• Port Shaper Rate	Controls the rate for the port shaper. This value is restricted to 100-1000000 when the "Unit" is "kbps", and it is restricted to 1-13200 when the "Unit" is "Mbps". The default value is 500.
• Port Shaper Unit	Controls the unit of measure for the port shaper rate as "kbps" or "Mbps". The default value is "kbps".

4.5.3 Storm Control

4.5.3.1 Storm Policing

Global storm policers for the switch are configured on this page.

There is a unicast storm policer, multicast storm policer, and a broadcast storm policer. These only affect flooded frames, i.e. frames with a (VLAN ID, DMAC) pair not present in the MAC Address table.

The displayed settings are:

Global Storm Policer Configuration

Frame Type	Enable	Rate	Unit
Unicast	<input type="checkbox"/>	10	fps ▼
Multicast	<input type="checkbox"/>	10	fps ▼
Broadcast	<input type="checkbox"/>	10	fps ▼

Apply Reset

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Frame Type 	The frame type for which the configuration below applies.
<ul style="list-style-type: none"> • Unit 	Controls the unit of measure for the global storm policer rate as fps, kfps, kbps or Mbps.

Buttons

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.5.4 Differentiated Service

4.5.4.1 Port DSCP

This page allows you to configure the basic QoS Port DSCP Configuration settings for all switch ports. The Port DSCP screen in [Figure 4-5-4-1](#) appears.

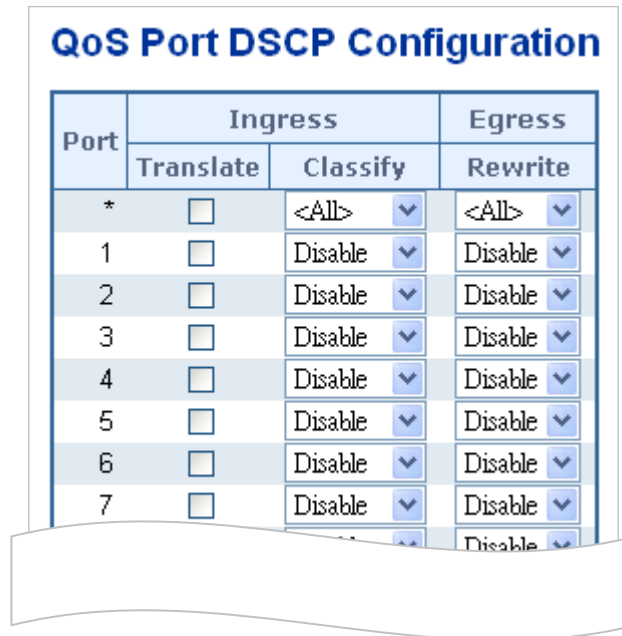

Figure 4-5-4-1: QoS Port DSCP Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port 	The Port column shows the list of ports for which you can configure dscp ingress and egress settings.
<ul style="list-style-type: none"> • Ingress 	<p>In Ingress settings you can change ingress translation and classification settings for individual ports.</p> <p>There are two configuration parameters available in Ingress:</p> <ul style="list-style-type: none"> ■ Translate ■ Classify
<ul style="list-style-type: none"> • Translate 	To Enable the Ingress Translation click the checkbox.
<ul style="list-style-type: none"> • Classify 	<p>Classification for a port have 4 different values.</p> <ul style="list-style-type: none"> ■ Disable: No Ingress DSCP Classification. ■ DSCP=0: Classify if incoming (or translated if enabled) DSCP is 0. ■ Selected: Classify only selected DSCP for which classification is enabled as specified in DSCP Translation window for the specific DSCP. ■ All: Classify all DSCP.

- Egress

Port Egress Rewriting can be one of -

- **Disable**: No Egress rewrite.
- **Enable**: Rewrite enable without remapped.
- **Remap DP Unaware**: DSCP from analyzer is remapped and frame is remarked with remapped DSCP value. The remapped DSCP value is always taken from the 'DSCP Translation->Egress Remap DP0' table.
- **Remap DP Aware**: DSCP from analyzer is remapped and frame is remarked with remapped DSCP value. Depending on the DP level of the frame, the remapped DSCP value is either taken from the 'DSCP Translation->Egress Remap DP0' table or from the 'DSCP Translation->Egress Remap DP1' table.

Buttons

: Click to undo any changes made locally and revert to previously saved values.

4.5.4.2 DSCP-based QoS

This page allows you to configure the basic QoS DSCP-based QoS Ingress Classification settings for all switches. The DSCP-based QoS screen in [Figure 4-5-4-2](#) appears.

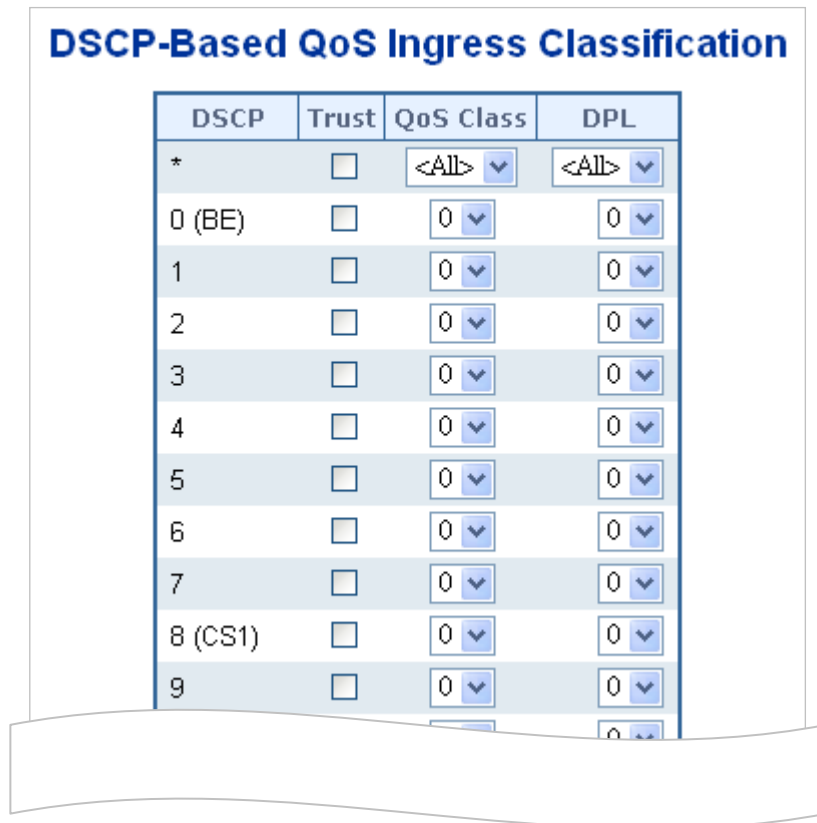

Figure 4-5-4-2: DSCP-based QoS Ingress Classification Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • DSCP 	Maximum number of supported DSCP values are 64.
<ul style="list-style-type: none"> • Trust 	Controls whether a specific DSCP value is trusted. Only frames with trusted DSCP values are mapped to a specific QoS class and Drop Precedence Level. Frames with untrusted DSCP values are treated as a non-IP frame.
<ul style="list-style-type: none"> • QoS Class 	QoS Class value can be any of (0-7)
<ul style="list-style-type: none"> • DPL 	Drop Precedence Level (0-1)

4.5.4.3 DSCP Translation

This page allows you to configure the basic QoS DSCP Translation settings for all switches. DSCP translation can be done in Ingress or Egress. The DSCP Translation screen in [Figure 4-4-4-3](#) appears.

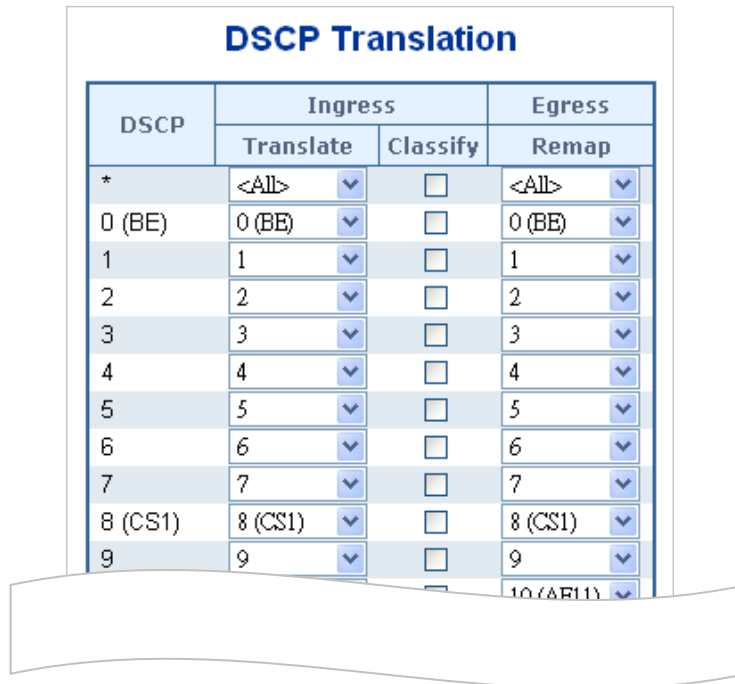

Figure 4-5-4-3: DSCP Translation Page Screenshot

The page includes the following fields:

Object	Description
• DSCP	Maximum number of supported DSCP values are 64 and valid DSCP value ranges from 0 to 63.
• Ingress	Ingress side DSCP can be first translated to new DSCP before using the DSCP for QoS class and DPL map. There are two configuration parameters for DSCP Translation – <ul style="list-style-type: none"> ■ Translate ■ Classify
• Translate	DSCP at Ingress side can be translated to any of (0-63) DSCP values.
• Classify	Click to enable Classification at Ingress side.
• Egress	There is following configurable parameter for Egress side - <ul style="list-style-type: none"> ■ Remap
• Remap DP	Select the DSCP value from select menu to which you want to remap. DSCP value ranges form 0 to 63.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.5.4.4 DSCP Classification

This page allows you to map DSCP value to a QoS Class and DPL value. The DSCP Classification screen in [Figure 4-5-4-4](#) appears.

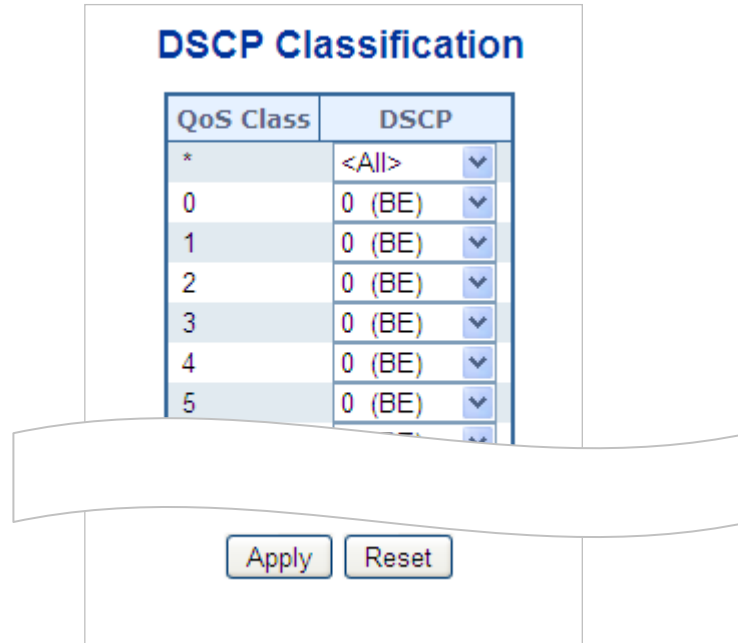

Figure 4-5-4-4: DSCP Classification Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • QoS Class 	Available QoS Class value ranges from 0 to 7. QoS Class (0-7) can be mapped to followed parameters.
<ul style="list-style-type: none"> • DPL 	Actual Drop Precedence Level.
<ul style="list-style-type: none"> • DSCP 	Select DSCP value (0-63) from DSCP menu to map DSCP to corresponding QoS Class and DPL value

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.5.5 QCL

4.5.5.1 QoS Control List

This page shows the QoS Control List(QCL), which is made up of the QCEs. Each row describes a QCE that is defined. The maximum number of QCEs is 256 on each switch.

Click on the lowest plus sign to add a new QCE to the list.

QoS Control List Configuration

QCE	Port	DMAC	SMAC	Tag Type	VID	PCP	DEI	Frame Type	Action							
									CoS	DPL	DSCP	PCP	DEI	Policy	Ingress Map	
+																

Figure 4-5-5-1: QoS Control List Configuration Page Screenshot

The page includes the following fields:

Object	Description
• QCE	Indicates the index of QCE.
• Port	Indicates the list of ports configured with the QCE.
• DMAC	Specify the type of Destination MAC addresses for incoming frame. Possible values are: <ul style="list-style-type: none"> ■ Any: All types of Destination MAC addresses are allowed. ■ Unicast: Only Unicast MAC addresses are allowed. ■ Multicast: Only Multicast MAC addresses are allowed. ■ Broadcast: Only Broadcast MAC addresses are allowed. The default value is 'Any'.
• SMAC	Displays the OUI field of Source MAC address, i.e. first three octet (byte) of MAC address.
• Tag Type	Indicates tag type. Possible values are: <ul style="list-style-type: none"> ■ Any: Match tagged and untagged frames. ■ Untagged: Match untagged frames. ■ Tagged: Match tagged frames. The default value is 'Any'
• VID	Indicates (VLAN ID), either a specific VID or range of VIDs. VID can be in the range 1-4095 or 'Any'
• PCP	Priority Code Point: Valid value PCP are specific(0, 1, 2, 3, 4, 5, 6, 7) or range(0-1, 2-3, 4-5, 6-7, 0-3, 4-7) or 'Any'.
• DEI	Drop Eligible Indicator: Valid value of DEI can be any of values between 0, 1 or 'Any'.

<ul style="list-style-type: none"> • Frame Type 	<p>Indicates the type of frame to look for incoming frames. Possible frame types are:</p> <ul style="list-style-type: none"> ■ Any: The QCE will match all frame type. ■ Ethernet: Only Ethernet frames (with Ether Type 0x600-0xFFFF) are allowed. ■ LLC: Only (LLC) frames are allowed. ■ SNAP: Only (SNAP) frames are allowed. ■ IPv4: The QCE will match only IPV4 frames. ■ IPv6: The QCE will match only IPV6 frames.
<ul style="list-style-type: none"> • Action 	<p>Indicates the classification action taken on ingress frame if parameters configured are matched with the frame's content.</p> <p>There are three action fields: Class, DPL and DSCP.</p> <ul style="list-style-type: none"> ■ Class: Classified QoS class. ■ DPL: Classified Drop Precedence Level. ■ DSCP: Classified DSCP value.
<ul style="list-style-type: none"> • Modification Buttons 	<p>You can modify each QCE in the table using the following buttons:</p> <ul style="list-style-type: none"> ⊕: Inserts a new QCE before the current row. ⓔ: Edits the QCE. ⬆: Moves the QCE up the list. ⬇: Moves the QCE down the list. ⓧ: Deletes the QCE. ⊕: The lowest plus sign adds a new entry at the bottom of the list of QCL.

4.5.5.2 QCL Status

This page shows the QCL status by different QCL users. Each row describes the QCE that is defined. It is a conflict if a specific QCE is not applied to the hardware due to hardware limitations. The maximum number of QCEs is **256** on each switch. The QoS Control List Status screen in [Figure 4-5-5-2](#) appears.

QoS Control List Status

User	QCE	Port	Frame Type	Action						Conflict
				CoS	DPL	DSCP	PCP	DEI	Policy	
No entries										

Figure 4-5-5-2: QoS Control List Status Page Screenshot

The page includes the following fields:

Object	Description
• User	Indicates the QCL user.
• QCE#	Indicates the index of QCE.
• Port	Indicates the list of ports configured with the QCE.
• Frame Type	<p>Indicates the type of frame to look for incoming frames. Possible frame types are:</p> <ul style="list-style-type: none"> ■ Any: The QCE will match all frame types. ■ Ethernet: Only Ethernet frames (with Ether Type 0x600-0xFFFF) are allowed. ■ LLC: Only (LLC) frames are allowed. ■ SNAP: Only (SNAP) frames are allowed. ■ IPv4: The QCE will match only IPV4 frames. ■ IPv6: The QCE will match only IPV6 frames.
• Action	<p>Indicates the classification action taken on ingress frame if parameters configured are matched with the frame's content.</p> <p>There are three action fields: Class, DPL and DSCP.</p> <ul style="list-style-type: none"> ■ Class: Classified QoS class; if a frame matches the QCE it will be put in the queue. ■ DPL: Drop Precedence Level; if a frame matches the QCE then DP level will set to value displayed under DPL column. ■ DSCP: If a frame matches the QCE then DSCP will be classified with the value displayed under DSCP column.
• Conflict	<p>Displays Conflict status of QCL entries. As H/W resources are shared by multiple applications. It may happen that resources required to add a QCE may not be available, in that case it shows conflict status as 'Yes', otherwise it is always 'No'.</p> <p>Please note that conflict can be resolved by releasing the H/W resources required to add QCL entry on pressing 'Resolve Conflict' button.</p>

Buttons

: Select the QCL status from this drop down list.

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to release the resources required to add QCL entry, in case the conflict status for any QCL entry

is 'yes'.

: Click to refresh the page.

4.5.6 Voice VLAN

4.5.6.1 Voice VLAN Configuration

The Voice VLAN feature enables voice traffic forwarding on the Voice VLAN, then the switch can classify and schedule network traffic. It is recommended that there be two VLANs on a port - one for voice, one for data.

Before connecting the IP device to the switch, the IP phone should configure the voice VLAN ID correctly. It should be configured through its own GUI. The Voice VLAN Configuration screen in [Figure 4-5-6-1](#) appears.

Voice VLAN Configuration

Mode	Disabled
VLAN ID	1000
Aging Time	86400 seconds
Traffic Class	7 (High)

Port Configuration

Port	Mode	Security	Discovery Protocol
*	<All>	<All>	<All>
1	Disabled	Disabled	OUI
2	Disabled	Disabled	OUI
3	Disabled	Disabled	OUI
4	Disabled	Disabled	OUI
5	Disabled	Disabled	OUI
6	Disabled	Disabled	OUI
7	Disabled	Disabled	OUI

Figure 4-5-6-1: Voice VLAN Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Mode 	<p>Indicates the Voice VLAN mode operation. We must disable MSTP feature before we enable Voice VLAN. It can avoid the conflict of ingress filter. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable Voice VLAN mode operation. ■ Disabled: Disable Voice VLAN mode operation.

<ul style="list-style-type: none"> • VLAN ID 	<p>Indicates the Voice VLAN ID. It should be a unique VLAN ID in the system and cannot equal each port PVID. It is conflict configuration if the value equal management VID, MVR VID, PVID etc.</p> <p>The allowed range is 1 to 4095.</p>
<ul style="list-style-type: none"> • Aging Time 	<p>Indicates the Voice VLAN secure learning age time. The allowed range is 10 to 10000000 seconds. It used when security mode or auto detect mode is enabled. In other cases, it will based hardware age time.</p> <p>The actual age time will be situated in the [age_time; 2 * age_time] interval.</p>
<ul style="list-style-type: none"> • Traffic Class 	<p>Indicates the Voice VLAN traffic class. All traffic on Voice VLAN will apply this class.</p>
<ul style="list-style-type: none"> • Mode 	<p>Indicates the Voice VLAN port mode.</p> <p>Possible port modes are:</p> <ul style="list-style-type: none"> ■ Disabled: Disjoin from Voice VLAN. ■ Auto: Enable auto detect mode. It detects whether there is VoIP phone attached to the specific port and configures the Voice VLAN members automatically. ■ Forced: Force join to Voice VLAN.
<ul style="list-style-type: none"> • Port Security 	<p>Indicates the Voice VLAN port security mode. When the function is enabled, all non-telephone MAC address in Voice VLAN will be blocked 10 seconds. Possible port modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable Voice VLAN security mode operation. ■ Disabled: Disable Voice VLAN security mode operation.
<ul style="list-style-type: none"> • Port Discovery Protocol 	<p>Indicates the Voice VLAN port discovery protocol. It will only work when auto detect mode is enabled. We should enable LLDP feature before configuring discovery protocol to "LLDP" or "Both". Changing the discovery protocol to "OUI" or "LLDP" will restart auto detect process. Possible discovery protocols are:</p> <ul style="list-style-type: none"> ■ OUI: Detect telephony device by OUI address. ■ LLDP: Detect telephony device by LLDP. ■ Both: Both OUI and LLDP.

4.5.6.2 Voice VLAN OUI

Configure VOICE VLAN OUI table on this page. The maximum entry number is 16. Modifying the OUI table will restart auto detection of OUI process. The Voice VLAN OUI Table screen in [Figure 4-5-6-2](#) appears.

Figure 4-5-6-2: Voice VLAN OUI Table Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Delete 	Check to delete the entry. It will be deleted during the next save.
<ul style="list-style-type: none"> • Telephony OUI 	An telephony OUI address is a globally unique identifier assigned to a vendor by IEEE. It must be 6 characters long and the input format is "xx-xx-xx" (x is a hexadecimal digit).
<ul style="list-style-type: none"> • Description 	The description of OUI address. Normally, it describes which vendor telephony device it belongs to. The allowed string length is 0 to 32.

Buttons

: Click to add a new access management entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6 Security

4.6.1 Access Security

4.6.1.1 Authentication Method

This page allows you to configure how a user is authenticated when he logs into the switch via one of the management client interfaces. The Authentication Method Configuration screen in [Figure 4-6-2-1](#) appears.

Authentication Method Configuration

Client	Methods		
console	local ▼	no ▼	no ▼
telnet	local ▼	no ▼	no ▼
ssh	local ▼	no ▼	no ▼
http	local ▼	no ▼	no ▼

Command Authorization Method Configuration

Client	Method	Cmd Lvl	Cfg Cmd
console	no ▼	0	<input type="checkbox"/>
telnet	no ▼	0	<input type="checkbox"/>
ssh	no ▼	0	<input type="checkbox"/>

Accounting Method Configuration

Client	Method	Cmd Lvl	Exec
console	no ▼		<input type="checkbox"/>
telnet	no ▼		<input type="checkbox"/>
ssh	no ▼		<input type="checkbox"/>

Figure 4-6-2-1: Authentication Method Configuration Page Screenshot

The page includes the following fields:

Authentication Method Configuration

The authentication section allows you to configure how a user is authenticated when he logs into the switch via one of the management client interfaces.

The table has one row for each client type and a number of columns, which are:

Object	Description
• Client	The management client for which the configuration below applies.
• Methods	<p>Method can be set to one of the following values:</p> <ul style="list-style-type: none"> • no: Authentication is disabled and login is not possible. • local: Use the local user database on the switch for authentication. • radius: Use remote RADIUS server(s) for authentication. • tacacs: Use remote TACACS+ server(s) for authentication..

Command Authorization Method Configuration

The command authorization section allows you to limit the CLI commands available to a user.

The table has one row for each client type and a number of columns, which are:

Object	Description
• Client	The management client for which the configuration below applies.
• Methods	<p>Method can be set to one of the following values:</p> <ul style="list-style-type: none"> • no: Command authorization is disabled. User is granted access to CLI commands according to his privilege level. • tacacs: Use remote TACACS+ server(s) for command authorization. If all remote servers are offline, the user is granted access to CLI commands according to his privilege level
• Cmd Lvl	<p>Authorize all commands with a privilege level higher than or equal to this level.</p> <p>Valid values are in the range 0 to 15.</p>
• Cfg Cmd	Also authorize configuration commands

Accounting Method Configuration

The accounting section allows you to configure command and exec (login) accounting.

The table has one row for each client type and a number of columns, which are:

Object	Description
• Client	The management client for which the configuration below applies.
• Methods	Method can be set to one of the following values: <ul style="list-style-type: none"> • no: Accounting is disabled. • tacacs: Use remote TACACS+ server(s) for accounting.
• Cmd Lvl	Enable accounting of all commands with a privilege level higher than or equal to this level. Valid values are in the range 0 to 15. Leave the field empty to disable command accounting.
• Exec	Enable exec (login) accounting.

Buttons

 : Click to apply changes

 : Click to undo any changes made locally and revert to previously saved values.

4.6.1.2 Access Management

Configure access management table on this page. The maximum entry number is 16. If the application's type match any one of the access management entries, it will allow access to the switch. The Access Management Configuration screen in [Figure 4-6-1-1](#) appears.

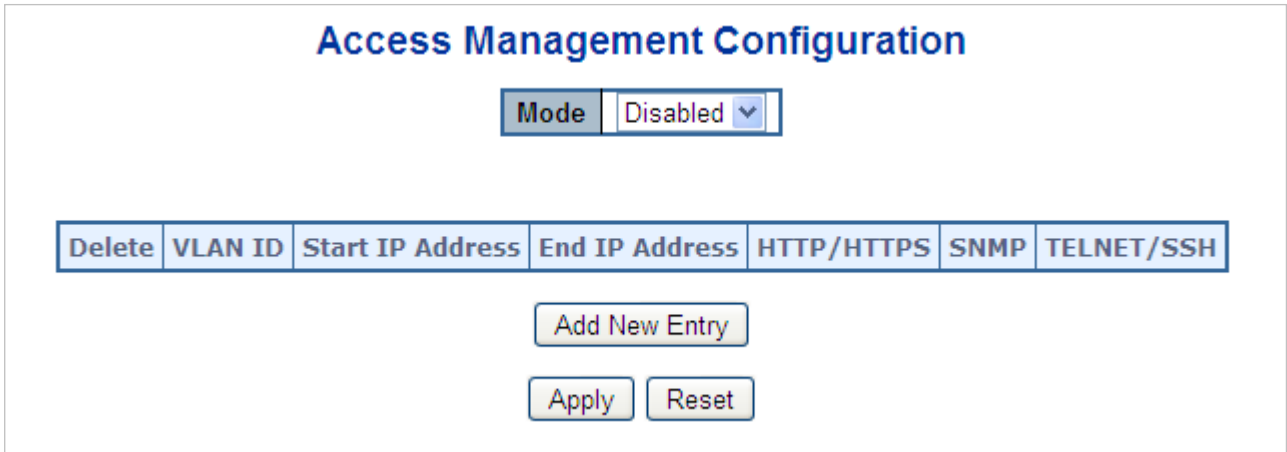

Figure 4-6-1-1: Access Management Configuration Overview Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Mode 	Indicates the access management mode operation. Possible modes are: Enabled: Enable access management mode operation. Disabled: Disable access management mode operation.
<ul style="list-style-type: none"> Delete 	Check to delete the entry. It will be deleted during the next apply .
<ul style="list-style-type: none"> VLAN ID 	Indicates the VLAN ID for the access management entry.
<ul style="list-style-type: none"> Start IP address 	Indicates the start IP address for the access management entry.
<ul style="list-style-type: none"> End IP address 	Indicates the end IP address for the access management entry.
<ul style="list-style-type: none"> HTTP/HTTPS 	Indicates the host can access the switch from HTTP/HTTPS interface that the host IP address matched the entry.
<ul style="list-style-type: none"> SNMP 	Indicates the host can access the switch from SNMP interface that the host IP address matched the entry.
<ul style="list-style-type: none"> Telnet/SSH 	Indicates the host can access the switch from TELNET/SSH interface that the host IP address matched the entry.

Buttons

: Click to add a new access management entry.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.1.3 Access Management Statistics

This page provides statistics for access management. The Access Management Statistics screen in [Figure 4-6-1-2](#) appears.

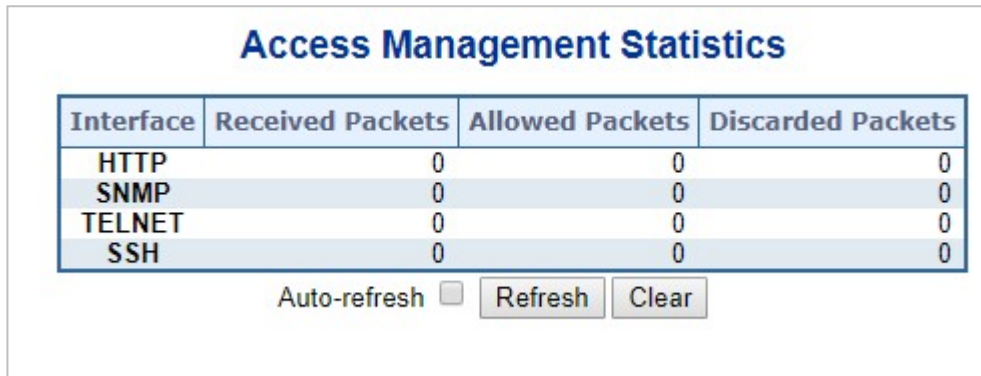

Figure 4-6-1-2: Access Management Statistics Overview Page Screenshot

The page includes the following fields:

Object	Description
• Interface	The interface that allowed remote host can access the switch.
• Receive Packets	The received packets number from the interface under access management mode is enabled.
• Allow Packets	The allowed packets number from the interface under access management mode is enabled.
• Discard Packets	The discarded packets number from the interface under access management mode is enabled.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page immediately.

: Clears all statistics.

4.6.1.4 SSH

Configure SSH on this page. This page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The status page is divided into two sections - one with a legend of user modules and one with the actual port status. The SSH Configuration screen in [Figure 4-6-1-3](#) appears.

Figure 4-6-1-3: SSH Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	Indicates the SSH mode operation. Possible modes are: <ul style="list-style-type: none"> ■ Enabled: Enable SSH mode operation. ■ Disabled: Disable SSH mode operation.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.1.5 HTTPS

Configure HTTPS on this page. The HTTPS Configuration screen in [Figure 4-6-1-4](#) appears.

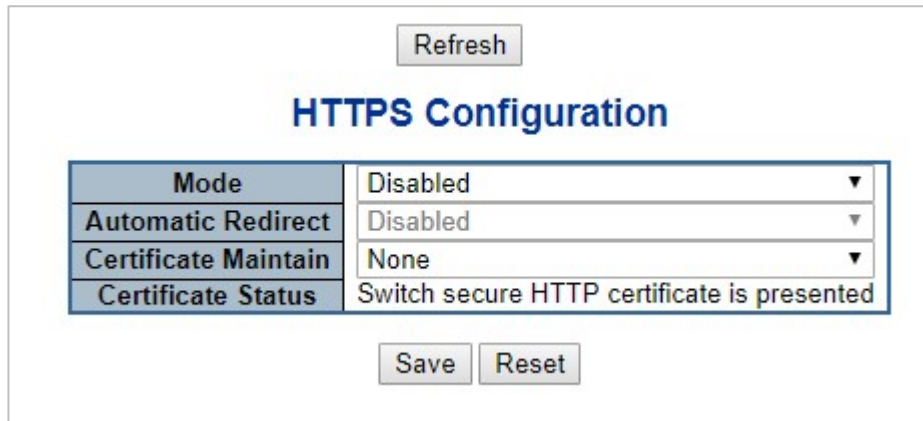

Figure 4-6-1-4: HTTPS Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Indicates the HTTPS mode operation. When the current connection is HTTPS, to apply HTTPS disabled mode operation will automatically redirect web browser to an HTTP connection. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable HTTPS mode operation. ■ Disabled: Disable HTTPS mode operation.
<ul style="list-style-type: none"> • Automatic Redirect 	<p>Indicates the HTTPS redirect mode operation. It only significant if HTTPS mode "Enabled" is selected. Automatically redirects web browser to an HTTPS connection when both HTTPS mode and Automatic Redirect are enabled or redirects web browser to an HTTP connection when both are disabled. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable HTTPS redirect mode operation. ■ Disabled: Disable HTTPS redirect mode operation.
<ul style="list-style-type: none"> • Certificate Maintain 	<p>The operation of certificate maintenance.</p> <p>Possible operations are:</p> <ul style="list-style-type: none"> None: No operation. Delete: Delete the current certificate. Upload: Upload a certificate PEM file. Possible methods are: Web Browser or URL. Generate: Generate a new self-signed RSA certificate.
<ul style="list-style-type: none"> • Certificate Pass Phrase 	<p>Enter the pass phrase in this field if your uploading certificate is protected by a specific passphrase.</p>

<ul style="list-style-type: none"> • Certificate Upload 	<p>Upload a certificate PEM file into the switch. The file should contain the certificate and private key together. If you have two separated files for saving certificate and private key. Use the Linux cat command to combine them into a single PEM file. For example, <code>cat my.cert my.key > my.pem</code></p> <p>Notice that the RSA certificate is recommended since most of the new version of browsers has removed support for DSA in certificate, e.g. Firefox v37 and Chrome v39.</p> <p>Possible methods are:</p> <p>Web Browser: Upload a certificate via Web browser.</p> <p>URL: Upload a certificate via URL, the supported protocols are HTTP, HTTPS, TFTP and FTP. The URL format is <code><protocol>://[<username>[:<password>]@]<host>[:<port>][/<path>]/<file_name></code>. For example, <code>tftp://10.10.10.10/new_image_path/new_image.dat</code>, <code>http://username:password@10.10.10.10:80/new_image_path/new_image.dat</code>. A valid file name is a text string drawn from alphabet (A-Za-z), digits (0-9), dot (.), hyphen (-), under score(_). The maximum length is 63 and hyphen must not be first character. The file name content that only contains '.' is not allowed.</p>
<ul style="list-style-type: none"> • Certificate Status 	<p>Display the current status of certificate on the switch.</p> <p>Possible statuses are:</p> <p>Switch secure HTTP certificate is presented.</p> <p>Switch secure HTTP certificate is not presented.</p> <p>Switch secure HTTP certificate is generating ...</p>

 : Click to undo any changes made locally and revert to previously saved values.

 : Click to refresh the page. Any changes made locally will be undone.

4.6.2 AAA

This section is to control the access to the Managed Switch, including the user access and management control.

The Authentication section contains links to the following main topics:

- **User Authentication**
- **IEEE 802.1X Port-based Network Access Control**
- **MAC-based Authentication**

Overview of 802.1X (Port-Based) Authentication

In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as **EAPOL (EAP Over LANs)** frames. EAPOL frames encapsulate **EAP PDUs** (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like **MD5-Challenge**, **PEAP**, and **TLS**. The important thing is that the authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Overview of MAC-based Authentication

Unlike 802.1X, MAC-based authentication is not a standard, but merely a best-practices method adopted by the industry. In MAC-based authentication, users are called clients, and the switch acts as the supplicant on behalf of clients. The initial frame (any kind of frame) sent by a client is snooped by the switch, which in turn uses the client's MAC address as both username and password in the subsequent EAP exchange with the RADIUS server. The 6-byte MAC address is converted to a string on the following form "xx-xx-xx-xx-xx-xx", that is, a dash (-) is used as separator between the lower-cased hexadecimal digits. The switch only supports the MD5-Challenge authentication method, so the RADIUS server must be configured accordingly.

When authentication is complete, the RADIUS server sends a success or failure indication, which in turn causes the switch to open up or block traffic for that particular client, using static entries into the MAC Table. Only then will frames from the client be forwarded on the switch. There are no EAPOL frames involved in this authentication, and therefore, MAC-based Authentication has nothing to do with the 802.1X standard.

The advantage of MAC-based authentication over 802.1X is that several clients can be connected to the same port (e.g. through a 3rd party switch or a hub) and still require individual authentication, and that the clients don't need special supplicant software to authenticate. The disadvantage is that MAC addresses can be spoofed by malicious users, equipment whose MAC address is a valid RADIUS user can be used by anyone, and only the MD5-Challenge method is supported.

The 802.1X and MAC-Based Authentication configuration consists of two sections, a system- and a port-wide.

Overview of User Authentication

It is allowed to configure the Managed Switch to authenticate users logging into the system for management access using local or remote authentication methods, such as telnet and Web browser. This Managed Switch provides secure network management access using the following options:

- **Remote Authentication Dial-in User Service (RADIUS)**
- **Terminal Access Controller Access Control System Plus (TACACS+)**
- **Local user name and Privilege Level control**

RADIUS and TACACS+ are logon authentication protocols that use software running on a central server to control access to RADIUS-aware or TACACS-aware devices on the network. An **authentication server** contains a database of multiple user name / password pairs with associated privilege levels for each user that requires management access to the Managed Switch.

Understanding IEEE 802.1X Port-based Authentication

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, 802.1X access control allows only **Extensible Authentication Protocol over LAN (EAPOL)** traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

This section includes this conceptual information:

- Device Roles
- Authentication Initiation and Message Exchange
- Ports in Authorized and Unauthorized States

■ **Device Roles**

With 802.1X port-based authentication, the devices in the network have specific roles as shown below.

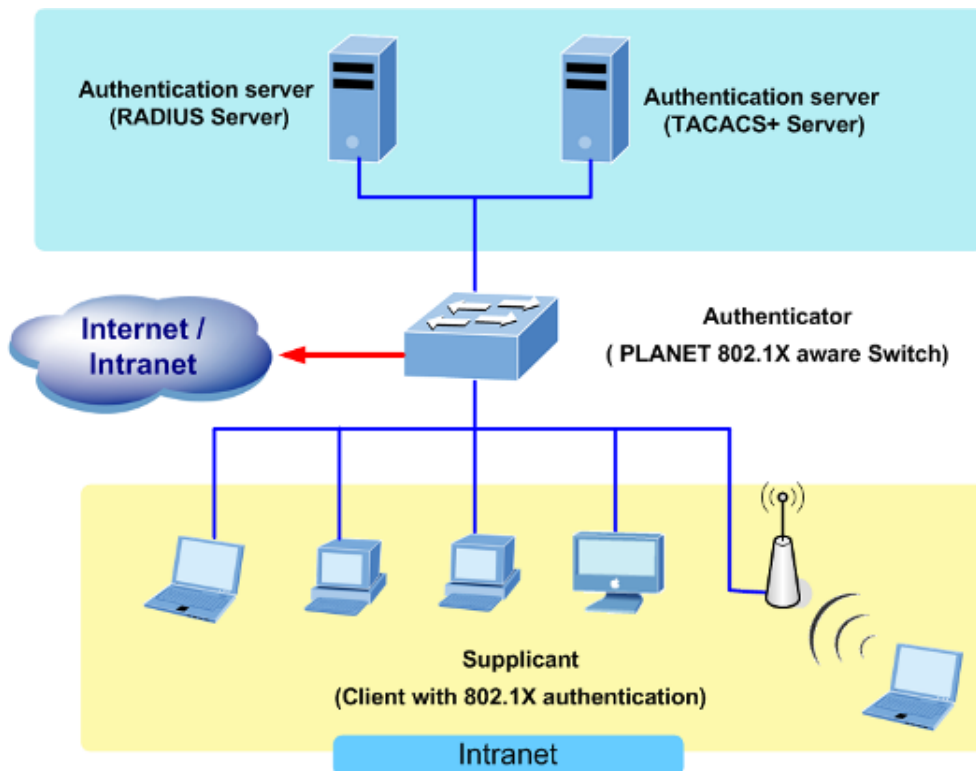

Figure 4-5-2

- **Client**—the device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running 802.1X-compliant client software such as that offered in the Microsoft Windows XP operating system. (The client is the *supplicant* in the IEEE 802.1X specification.)
- **Authentication server**—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the Remote Authentication Dial-In User Service (RADIUS) security system with **Extensible Authentication Protocol (EAP)** extensions is the only supported authentication server; it is available in Cisco Secure Access Control Server version 3.0. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.
- **Switch (802.1X device)**—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the Extensible Authentication Protocol (EAP) frames and interacting with the authentication server. When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is re-encapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server's frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

■ **Authentication Initiation and Message Exchange**

The switch or the client can initiate authentication. If you enable authentication on a port by using the **dot1x port-control auto** interface configuration command, the switch must initiate authentication when it determines that the port link state transitions from down to up. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity

If 802.1X is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. "Figure 4-5-2" shows a message exchange initiated by the client using the One-Time-Password (OTP) authentication method with a RADIUS server.

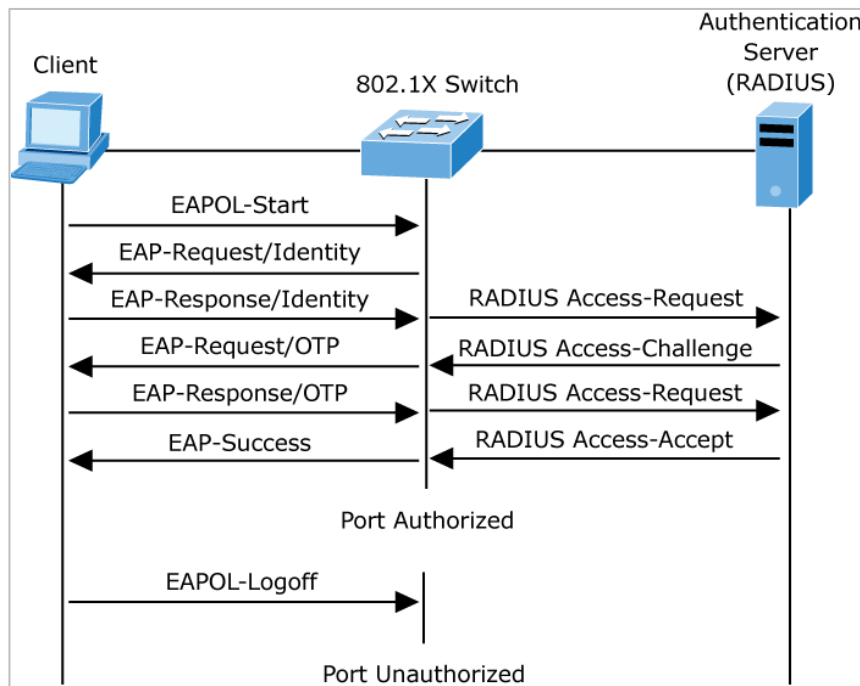

Figure 4-5-2: EAP Message Exchange

■ **Ports in Authorized and Unauthorized States**

The switch port state determines whether or not the client is granted access to the network. The port starts in the *unauthorized* state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the *authorized* state, allowing all traffic for the client to flow normally.

If a client that does not support 802.1X is connected to an unauthorized 802.1X port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to transition to the unauthorized state.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

4.6.2.1 RADIUS

This page allows you to configure the RADIUS Servers. The RADIUS Configuration screen in [Figure 4-6-2-2](#) appears.

Figure 4-6-2-2: RADIUS Server Configuration Page Screenshot

The page includes the following fields:

Global Configuration

These settings are common for all of the RADIUS Servers.

Object	Description
<ul style="list-style-type: none"> • Timeout 	Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply from a RADIUS server before retransmitting the request.
<ul style="list-style-type: none"> • Retransmit 	Retransmit is the number of times, in the range from 1 to 1000; a RADIUS request is retransmitted to a server that is not responding. If the server has not responded after the last retransmit, it is considered to be dead.
<ul style="list-style-type: none"> • Dead Time 	The Dead Time, which can be set to a number between 0 and 3600 seconds, is the period during which the switch will not send new requests to a server that has failed to respond to a previous request. This will stop the switch from continually trying to contact a server that it has already determined as dead. Setting the Dead Time to a value greater than 0 (zero) will enable this feature, but only if more than one server has been configured.
<ul style="list-style-type: none"> • Key 	The secret key - up to 63 characters long - shared between the RADIUS server and the switch.

<ul style="list-style-type: none"> • NAS-IP-Address 	The IPv4 address to be used as attribute 4 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.
<ul style="list-style-type: none"> • NAS-IPv6-Address 	The IPv6 address to be used as attribute 95 in RADIUS Access-Request packets. If this field is left blank, the IP address of the outgoing interface is used.
<ul style="list-style-type: none"> • NAS-Identifier 	The identifier - up to 253 characters long - to be used as attribute 32 in RADIUS Access-Request packets. If this field is left blank, the NAS-Identifier is not included in the packet.

Server Configuration

The table has one row for each RADIUS Server and a number of columns, which are:

Object	Description
<ul style="list-style-type: none"> • Delete 	To delete a RADIUS server entry, check this box. The entry will be deleted during the next Save.
<ul style="list-style-type: none"> • Hostname 	The IP address or hostname of the RADIUS server.
<ul style="list-style-type: none"> • Auth Port 	The UDP port to use on the RADIUS server for authentication.
<ul style="list-style-type: none"> • Acct Port 	The UDP port to use on the RADIUS server for accounting.
<ul style="list-style-type: none"> • Timeout 	This optional setting overrides the global timeout value. Leaving it blank will use the global timeout value.
<ul style="list-style-type: none"> • Retransmit 	This optional setting overrides the global retransmit value. Leaving it blank will use the global retransmit value.
<ul style="list-style-type: none"> • Key 	This optional setting overrides the global key. Leaving it blank will use the global key.

Buttons

Add New Server: Click to add a new RADIUS server. An empty row is added to the table, and the RADIUS server can be configured as needed. Up to 5 servers are supported.

Delete: Click to undo the addition of the new server.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.6.2.2 TACACS+

This page allows you to configure the TACACS+ Servers. The TACACS+ Configuration screen in [Figure 4-6-2-3](#) appears.

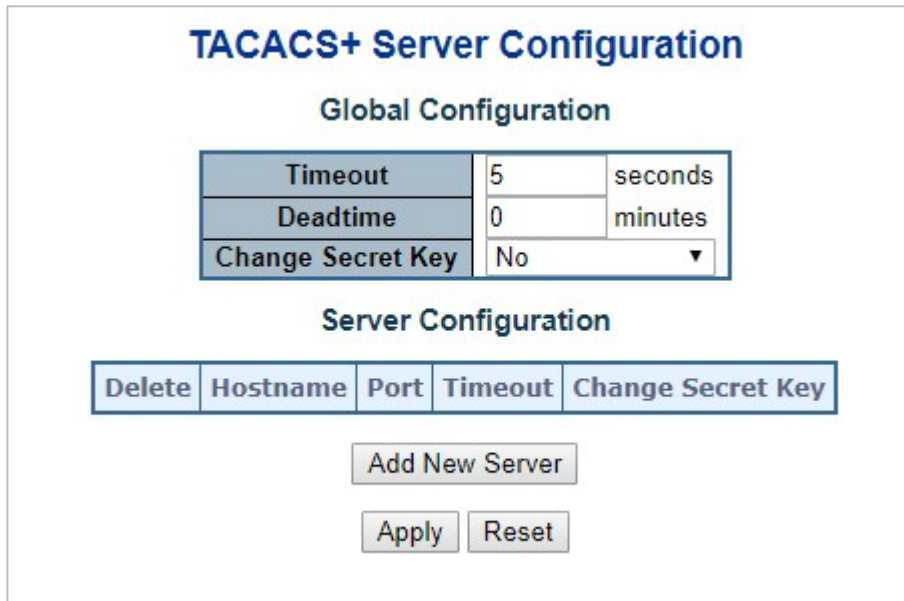

Figure 4-6-2-3: TACACS+ Server Configuration Page Screenshot

The page includes the following fields:

Global Configuration

These settings are common for all of the TACACS+ Servers.

Object	Description
<ul style="list-style-type: none"> • Timeout 	Timeout is the number of seconds, in the range 1 to 1000, to wait for a reply from a TACACS+ server before it is considered to be dead.
<ul style="list-style-type: none"> • Dead Time 	<p>The Dead Time, which can be set to a number between 0 to 1440 minutes, is the period during which the switch will not send new requests to a server that has failed to respond to a previous request. This will stop the switch from continually trying to contact a server that it has already determined as dead.</p> <p>Setting the Dead Time to a value greater than 0 (zero) will enable this feature, but only if more than one server has been configured.</p>
<ul style="list-style-type: none"> • Key 	Specify to change the secret key or not. When "Yes" is selected for the option, you can change the secret key - up to 63 characters long - shared between the TACACS+ server and the switch.

Server Configuration

The table has one row for each TACACS+ server and a number of columns, which are:

Object	Description
• Delete	To delete a TACACS+ server entry, check this box. The entry will be deleted during the next Save.
• Hostname	The IP address or hostname of the TACACS+ server.
• Port	The TCP port to use on the TACACS+ server for authentication.
• Timeout	This optional setting overrides the global timeout value. Leaving it blank will use the global timeout value.
• Key	This optional setting overrides the global key. Leaving it blank will use the global key.

Buttons

: Click to add a new TACACS+ server. An empty row is added to the table, and the TACACS+ server can be configured as needed. Up to 5 servers are supported.

: Click to undo the addition of the new server.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.2.3 RADIUS Overview

This page provides an overview of the status of the RADIUS servers configurable on the authentication configuration page. The RADIUS Authentication/Accounting Server Overview screen in [Figure 4-6-2-4](#) appears.

#	IP Address	Authentication Port	Authentication Status	Accounting Port	Accounting Status
1			Disabled		Disabled
2			Disabled		Disabled
3			Disabled		Disabled
4			Disabled		Disabled
5			Disabled		Disabled

Auto-refresh

Figure 4-6-2-4: RADIUS Authentication/Accounting Server Overview Page Screenshot

The page includes the following fields:

RADIUS Authentication Server Status Overview

Object	Description
• #	The RADIUS server number. Click to navigate to detailed statistics for this server.
• IP Address	The IP address and UDP port number (in <IP Address>:<UDP Port> notation) of this server.
• Authentication Port	UDP port number for authentication.
• Authentication Status	The current status of the server. This field takes one of the following values: Disabled: The server is disabled. Not Ready: The server is enabled, but IP communication is not yet up and running. Ready: The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept access attempts. Dead (X seconds left): Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled, but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.
• Accounting Port	UDP port number for accounting

• **Accounting**
Status

The current status of the server. This field takes one of the following values:

Disabled: The server is disabled.

Not Ready: The server is enabled, but IP communication is not yet up and running.

Ready: The server is enabled, IP communication is up and running, and the RADIUS module is ready to accept access attempts.

Dead (X seconds left): Access attempts were made to this server, but it did not reply within the configured timeout. The server has temporarily been disabled, but will get re-enabled when the dead-time expires. The number of seconds left before this occurs is displayed in parentheses. This state is only reachable when more than one server is enabled.

4.6.2.4 RADIUS Details

This page provides detailed statistics for a particular RADIUS server. The RADIUS Authentication/Accounting for Server Overview screen in below appears.

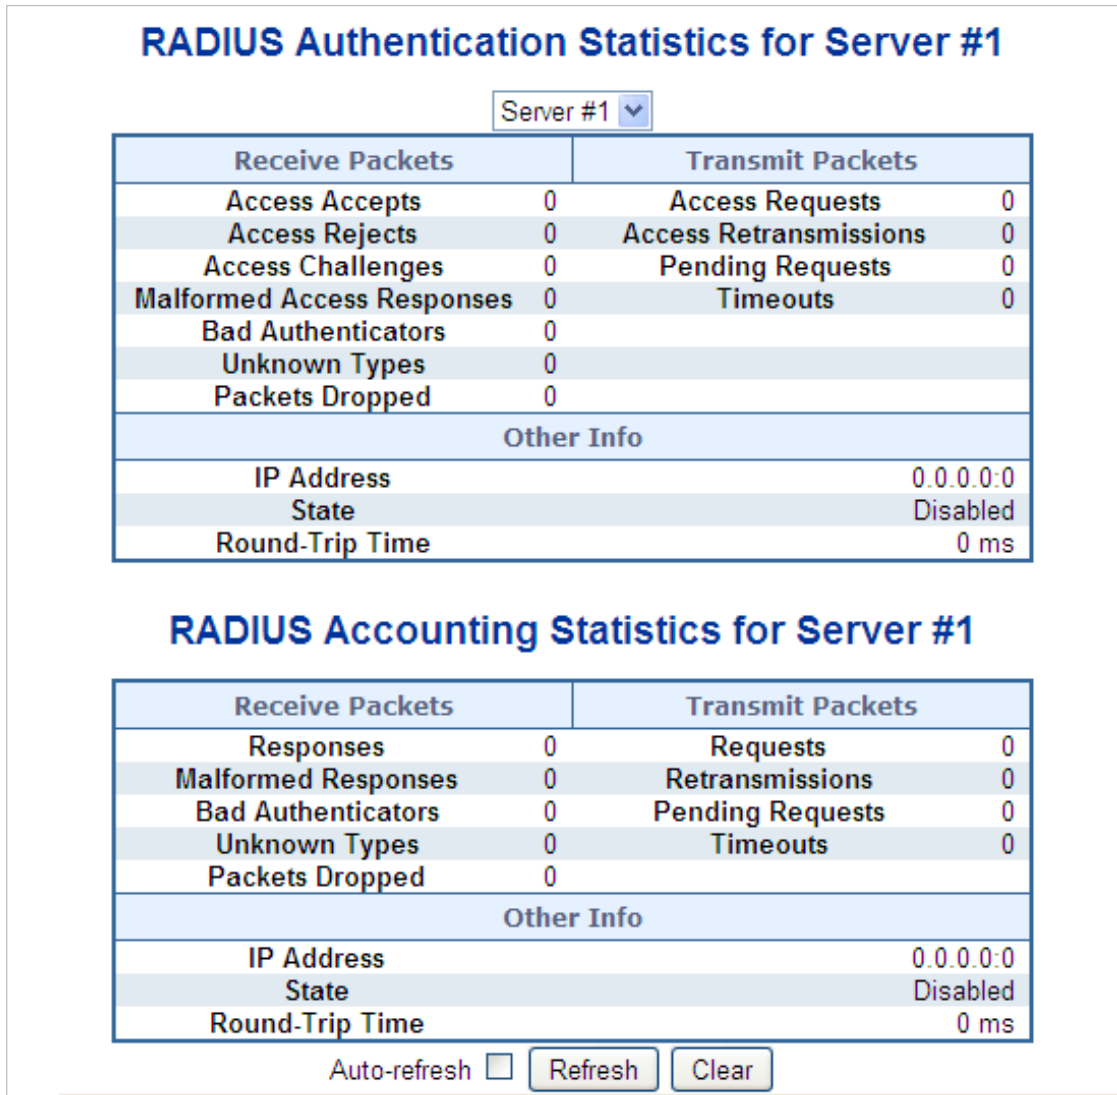

Figure : RADIUS Authentication/Accounting for Server Overview Screenshot

The page includes the following fields:

RADIUS Authentication Statistics

The statistics map closely to those specified in RFC4668 - RADIUS Authentication Client MIB. Use the server select box to switch between the backend servers to show details for.

Object	Description			
<ul style="list-style-type: none"> Packet Counters 	RADIUS authentication server packet counter. There are seven receive and four transmit counters.			
	Direction	Name	RFC4668 Name	Description
	Rx	Access Accepts	radiusAuthClientExtAccessAccepts	The number of RADIUS Access-Accept packets (valid or invalid) received from the server.
	Rx	Access Rejects	radiusAuthClientExtAccessRejects	The number of RADIUS Access-Reject packets (valid or invalid) received from the server.
	Rx	Access Challenges	radiusAuthClientExtAccessChallenges	The number of RADIUS Access-Challenge packets (valid or invalid) received from the server.
	Rx	Malformed Access Responses	radiusAuthClientExtMalformedAccessResponses	The number of malformed RADIUS Access-Response packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or Message Authenticator attributes or unknown types are not included as malformed access responses.
	Rx	Bad Authenticators	radiusAuthClientExtBadAuthenticators	The number of RADIUS Access-Response packets containing invalid authenticators or Message Authenticator attributes received from the server.

Rx	Unknown Types	radiusAuthClientExtUnknownTypes	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.
Rx	Packets Dropped	radiusAuthClientExtPacketsDropped	The number of RADIUS packets that were received from the server on the authentication port and dropped for some other reason.
Tx	Access Requests	radiusAuthClientExtAccessRequests	The number of RADIUS Access-Request packets sent to the server. This does not include retransmissions.
Tx	Access Retransmissions	radiusAuthClientExtAccessRetransmissions	The number of RADIUS Access-Request packets retransmitted to the RADIUS authentication server.
Tx	Pending Requests	radiusAuthClientExtPendingRequests	The number of RADIUS Access-Request packets destined for the server that have not yet timed out or received a response. This variable is incremented when an Access-Request is sent and decremented due to receipt of an Access-Accept, Access-Reject, Access-Challenge, timeout, or retransmission.

RADIUS Accounting Statistics

The statistics map closely to those specified in RFC4670 - RADIUS Accounting Client MIB. Use the server select box to switch between the backend servers to show details for.

Object	Description			
<ul style="list-style-type: none"> • Packet Counters 	RADIUS accounting server packet counter. There are five receive and four transmit counters.			
	Direction	Name	RFC4670 Name	Description
	Rx	Responses	radiusAccClientExt Responses	The number of RADIUS packets (valid or invalid) received from the server.
	Rx	Malformed Responses	radiusAccClientExt MalformedResponses	The number of malformed RADIUS packets received from the server. Malformed packets include packets with an invalid length. Bad authenticators or unknown types are not included as malformed access responses.
	Rx	Bad Authenticators	radiusAcctClientExt BadAuthenticators	The number of RADIUS packets containing invalid authenticators received from the server.
	Rx	Unknown Types	radiusAccClientExt UnknownTypes	The number of RADIUS packets of unknown types that were received from the server on the accounting port.
	Rx	Packets Dropped	radiusAccClientExt PacketsDropped	The number of RADIUS packets that were received from the server on the accounting port and dropped for some other reason.
Tx	Requests	radiusAccClientExt Requests	The number of RADIUS packets sent to the server. This does not include retransmissions.	

	Tx	Retransmissions	radiusAccClientExt Retransmissions	The number of RADIUS packets retransmitted to the RADIUS accounting server.						
	Tx	Pending Requests	radiusAccClientExt PendingRequests	The number of RADIUS packets destined for the server that have not yet timed out or received a response. This variable is incremented when a Request is sent and decremented due to receipt of a Response, timeout, or retransmission.						
	Tx	Timeouts	radiusAccClientExt Timeouts	The number of accounting timeouts to the server. After a timeout, the client may retry to the same server, send to a different server, or give up. A retry to the same server is counted as a retransmit as well as a timeout. A send to a different server is counted as a Request as well as a timeout.						
<ul style="list-style-type: none"> • Other Info 	This section contains information about the state of the server and the latest round-trip time.

: Click to refresh the page immediately.

: Clears the counters for the selected server. The "Pending Requests" counter will not be cleared by this operation.

4.6.3 Port Authentication

4.6.3.1 Network Access Server Configuration

This page allows you to configure the IEEE 802.1X and MAC-based authentication system and port settings. The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the "Configuration→Security→AAA" Page. The IEEE802.1X standard defines port-based operation, but non-standard variants overcome security limitations as shall be explored below.

MAC-based authentication allows for authentication of more than one user on the same port, and doesn't require the user to have special 802.1X supplicant software installed on his system. The switch uses the user's MAC address to authenticate against the backend server. Intruders can create counterfeit MAC addresses, which makes MAC-based authentication less secure than 802.1X authentication. The NAS configuration consists of two sections, a system- and a port-wide. The Network Access Server Configuration screen in below appears.

Network Access Server Configuration

System Configuration

Mode	Disabled ▼
Reauthentication Enabled	<input type="checkbox"/>
Reauthentication Period	3600 seconds
EAPOL Timeout	30 seconds
Aging Period	300 seconds

Figure: Network Access Server Configuration Page Screenshot

The page includes the following fields:

System Configuration

Object	Description
<ul style="list-style-type: none"> • Mode 	<p>Indicates if NAS is globally enabled or disabled on the switch. If globally disabled, all ports are allowed forwarding of frames.</p>
<ul style="list-style-type: none"> • Reauthentication Enabled 	<p>If checked, successfully authenticated supplicants/clients are reauthenticated after the interval specified by the Reauthentication Period. Reauthentication for 802.1X-enabled ports can be used to detect if a new device is plugged into a switch port or if a supplicant is no longer attached.</p> <p>For MAC-based ports, reauthentication is only useful if the RADIUS server</p>
<ul style="list-style-type: none"> • Reauthentication Period 	<p>Determines the period, in seconds, after which a connected client must be reauthenticated. This is only active if the Reauthentication Enabled checkbox is checked. Valid values are in the range 1 to 3600 seconds.</p>
<ul style="list-style-type: none"> • EAPOL Timeout 	<p>Determines the time for retransmission of Request Identity EAPOL frames. Valid values are in the range 1 to 65535 seconds. This has no effect for MAC-based ports.</p>
<ul style="list-style-type: none"> • Aging Period 	<p>This setting applies to the following modes, i.e. modes using the Port Security functionality to secure MAC addresses:</p> <ul style="list-style-type: none"> ■ Single 802.1X ■ Multi 802.1X ■ MAC-Based Auth. <p>When the NAS module uses the Port Security module to secure MAC addresses, the Port Security module needs to check for activity on the MAC address in question at regular intervals and free resources if no activity is seen within a given period of time. This parameter controls exactly this period and can be set to a number between 10 and 1000000 seconds.</p> <p>If reauthentication is enabled and the port is in a 802.1X-based mode, this is not so critical, since supplicants that are no longer attached to the port will get removed upon the next reauthentication, which will fail. But if reauthentication is not enabled, the only way to free resources is by aging the entries.</p> <p>For ports in MAC-based Auth. mode, reauthentication doesn't cause direct communication between the switch and the client, so this will not detect whether the client is still attached or not, and the only way to free any resources is to age the entry.</p>

<ul style="list-style-type: none"> • Hold Time 	<p>This setting applies to the following modes, i.e. modes using the Port Security functionality to secure MAC addresses:</p> <ul style="list-style-type: none"> ■ Single 802.1X ■ Multi 802.1X ■ MAC-Based Auth. <p>If a client is denied access, either because the RADIUS server denies the client access or because the RADIUS server request times out (according to the timeout specified on the "Configuration→Security→AAA" page), the client is put on hold in the Unauthorized state. The hold timer does not count during an on-going authentication.</p> <p>In MAC-based Auth. mode, the switch will ignore new frames coming from the client during the hold time.</p> <p>The Hold Time can be set to a number between 10 and 1000000 seconds.</p>
<ul style="list-style-type: none"> • RADIUS-Assigned QoS Enabled 	<p>RADIUS-assigned QoS provides a means to centrally control the traffic class to which traffic coming from a successfully authenticated supplicant is assigned on the switch. The RADIUS server must be configured to transmit special RADIUS attributes to take advantage of this feature.</p> <p>The "RADIUS-Assigned QoS Enabled" checkbox provides a quick way to globally enable/disable RADIUS-server assigned QoS Class functionality. When checked, the individual ports' ditto setting determines whether RADIUS-assigned QoS Class is enabled for that port. When unchecked, RADIUS-server assigned QoS Class is disabled for all ports.</p>
<ul style="list-style-type: none"> • RADIUS-Assigned VLAN Enabled 	<p>RADIUS-assigned VLAN provides a means to centrally control the VLAN on which a successfully authenticated supplicant is placed on the switch. Incoming traffic will be classified to and switched on the RADIUS-assigned VLAN. The RADIUS server must be configured to transmit special RADIUS attributes to take advantage of this feature.</p> <p>The "RADIUS-Assigned VLAN Enabled" checkbox provides a quick way to globally enable/disable RADIUS-server assigned VLAN functionality. When checked, the individual ports' ditto setting determines whether RADIUS-assigned VLAN is enabled for that port. When unchecked, RADIUS-server assigned VLAN is disabled for all ports.</p>

<ul style="list-style-type: none"> • Guest VLAN Enabled 	<p>A Guest VLAN is a special VLAN - typically with limited network access - on which 802.1X-unaware clients are placed after a network administrator-defined timeout. The switch follows a set of rules for entering and leaving the Guest VLAN as listed below.</p> <p>The "Guest VLAN Enabled" checkbox provides a quick way to globally enable/disable Guest VLAN functionality. When checked, the individual ports' ditto setting determines whether the port can be moved into Guest VLAN. When unchecked, the ability to move to the Guest VLAN is disabled for all ports.</p>
<ul style="list-style-type: none"> • Guest VLAN ID 	<p>This is the value that a port's Port VLAN ID is set to if a port is moved into the Guest VLAN. It is only changeable if the Guest VLAN option is globally enabled.</p> <p>Valid values are in the range [1; 4095].</p>
<ul style="list-style-type: none"> • Max. Reauth. Count 	<p>The number of times that the switch transmits an EAPOL Request Identity frame without response before considering entering the Guest VLAN is adjusted with this setting. The value can only be changed if the Guest VLAN option is globally enabled.</p> <p>Valid values are in the range [1; 255].</p>
<ul style="list-style-type: none"> • Allow Guest VLAN if EAPOL Seen 	<p>The switch remembers if an EAPOL frame has been received on the port for the life-time of the port. Once the switch considers whether to enter the Guest VLAN, it will first check if this option is enabled or disabled. If disabled (unchecked; default), the switch will only enter the Guest VLAN if an EAPOL frame has not been received on the port for the life-time of the port. If enabled (checked), the switch will consider entering the Guest VLAN even if an EAPOL frame has been received on the port for the life-time of the port.</p> <p>The value can only be changed if the Guest VLAN option is globally enabled.</p>

4.6.3.2 Network Access Overview

This page provides an overview of the current NAS port states for the selected switch. The Network Access Overview screen in [Figure 4-6-3-2](#) appears.

Port	Admin State	Port State	Last Source	Last ID	QoS Class	Port VLAN ID
1	Force Authorized	Globally Disabled			-	
2	Force Authorized	Globally Disabled			-	
3	Force Authorized	Globally Disabled			-	
4	Force Authorized	Globally Disabled			-	
5	Force Authorized	Globally Disabled			-	
6	Force Authorized	Globally Disabled			-	
7	Force Authorized	Globally Disabled			-	
8	Force Authorized	Globally Disabled			-	

Figure 4-6-3-2: Network Access Server Switch Status Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number. Click to navigate to detailed NAS statistics for this port.
• Admin State	The port's current administrative state. Refer to NAS Admin State for a description of possible values.
• Port State	The current state of the port. Refer to NAS Port State for a description of the individual states.
• Last Source	The source MAC address carried in the most recently received EAPOL frame for EAPOL-based authentication, and the most recently received frame from a new client for MAC-based authentication.
• Last ID	The user name (supplicant identity) carried in the most recently received Response Identity EAPOL frame for EAPOL-based authentication, and the source MAC address from the most recently received frame from a new client for MAC-based authentication.
• QoS Class	QoS Class assigned to the port by the RADIUS server if enabled.
• Port VLAN ID	The VLAN ID that NAS has put the port in. The field is blank, if the Port VLAN ID is not overridden by NAS. If the VLAN ID is assigned by the RADIUS server, "(RADIUS-assigned)" is appended to the VLAN ID. Read more about RADIUS-assigned VLANs here. If the port is moved to the Guest VLAN, "(Guest)" is appended to the VLAN ID. Read more about Guest VLANs here.

4.6.4 Port Security

4.6.4.1 Port Security Limit Control

This page allows you to configure the Port Security global and per-port settings.

Port Security allows for limiting the number of users on a given port. A user is identified by a MAC address and VLAN ID. If Port Security is enabled on a port, the limit specifies the maximum number of users on the port. If this number is exceeded, an action is taken depending on violation mode. The violation mode can be one of the four different described below.

The Port Security configuration consists of two sections, a global and a per-port.. The Port Limit Control Configuration screen in [Figure 4-6-4-1](#) appears.

Port Security Configuration

Global Configuration

Aging Enabled	<input type="checkbox"/>
Aging Period	3600 seconds
Hold Time	300 seconds

Port Configuration

Port	Mode	Limit	Violation Mode	Violation Limit	State

2	Disabled ▼	4	Protect ▼	4	Disabled
3	Disabled ▼	4	Protect ▼	4	Disabled
4	Disabled ▼	4	Protect ▼	4	Disabled
5	Disabled ▼	4	Protect ▼	4	Disabled
6	Disabled ▼	4	Protect ▼	4	Disabled
7	Disabled ▼	4	Protect ▼	4	Disabled
8	Disabled ▼	4	Protect ▼	4	Disabled

Figure 4-6-4-1: Port Limit Control Configuration Overview Page Screenshot

The page includes the following fields:

System Configuration

Object	Description
<ul style="list-style-type: none"> • Aging Enabled 	If checked, secured MAC addresses are subject to aging as discussed under Aging Period .

<ul style="list-style-type: none"> • Aging Period 	<p>If Aging Enabled is checked, then the aging period is controlled with this input. If other modules are using the underlying port security for securing MAC addresses, they may have other requirements to the aging period. The underlying port security will use the shorter requested aging period of all modules that use the functionality.</p> <p>The Aging Period can be set to a number between 10 and 10,000,000 seconds.</p> <p>To understand why aging may be desired, consider the following scenario: Suppose an end-host is connected to a 3rd party switch or hub, which in turn is connected to a port on this switch on which Limit Control is enabled. The end-host will be allowed to forward if the limit is not exceeded. Now suppose that the end-host logs off or powers down. If it wasn't for aging, the end-host would still take up resources on this switch and will be allowed to forward. To overcome this situation, enable aging. With aging enabled, a timer is started once the end-host gets secured. When the timer expires, the switch starts looking for frames from the end-host, and if such frames are not seen within the next Aging Period, the end-host is assumed to be disconnected, and the corresponding resources are freed on the switch.</p>
<ul style="list-style-type: none"> • Hold Time 	<p>The hold time - measured in seconds - is used to determine how long a MAC address is held in the MAC table if it has been found to violate the limit. Valid range is between 10 and 10000000 seconds with a default of 300 seconds.</p> <p>The reason for holding a violating MAC address in the MAC table is primarily to ensure that the same MAC address doesn't give rise to continuous notifications (if notifications on violation count is enabled).</p>

Port Configuration

The table has one row for each port and a number of columns, which are:

Object	Description
<ul style="list-style-type: none"> • Port 	<p>The port number for which the configuration below applies.</p>
<ul style="list-style-type: none"> • Mode 	<p>Controls whether Limit Control is enabled on this port. Both this and the Global Mode must be set to Enabled for Limit Control to be in effect. Notice that other modules may still use the underlying port security features without enabling Limit Control on a given port.</p>
<ul style="list-style-type: none"> • Limit 	<p>The maximum number of MAC addresses that can be secured on this port. This number cannot exceed 1024. If the limit is exceeded, the corresponding action is taken.</p> <p>The switch is "born" with a total number of MAC addresses from which all ports draw whenever a new MAC address is seen on a Port Security-enabled port. Since all ports draw from the same pool, it may happen that a configured maximum cannot be granted, if the remaining ports have already used all available MAC addresses.</p>

<ul style="list-style-type: none"> • Violation Mode 	<p>If Limit is reached, the switch can take one of the following actions:</p> <p>Protect: Do not allow more than Limit MAC addresses on the port, but take no further action.</p> <p>Restrict: If Limit is reached, subsequent MAC addresses on the port will be counted and marked as violating. Such MAC addresses are removed from the MAC table when the hold time expires. At most Violation Limit MAC addresses can be marked as violating at any given time.</p> <p>Shutdown: If Limit is reached, one additional MAC address will cause the port to be shut down. This implies that all secured MAC addresses be removed from the port, and no new addresses be learned. There are three ways to re-open the port:</p> <ol style="list-style-type: none"> 1) In the "Configuration→Ports" page's "Configured" column, first disable the port, then restore the original mode. 2) Make a Port Security configuration change on the port. 3) Boot the switch.
<ul style="list-style-type: none"> • Violation Limit 	<ul style="list-style-type: none"> ■ The maximum number of MAC addresses that can be marked as violating on this port. This number cannot exceed 1024. Default is 4. It is only used when Violation Mode is Restrict.
<ul style="list-style-type: none"> • State 	<p>This column shows the current state of the port as seen from the Limit Control's point of view. The state takes one of four values:</p> <ul style="list-style-type: none"> ■ Disabled: Limit Control is either globally disabled or disabled on the port. ■ Ready: The limit is not yet reached. This can be shown for all actions. ■ Limit Reached: Indicates that the limit is reached on this port. This state can only be shown if Action is set to None or Trap. <p>Shutdown: Indicates that the port is shut down by the Limit Control module. This state can only be shown if Action is set to Shutdown or Trap & Shutdown.</p>

4.6.4.2 Port Security Status

This page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The status page is divided into two sections - one with a legend of user modules and one with the actual port status. The Port Security Status screen in [Figure 4-6-4-2](#) appears.

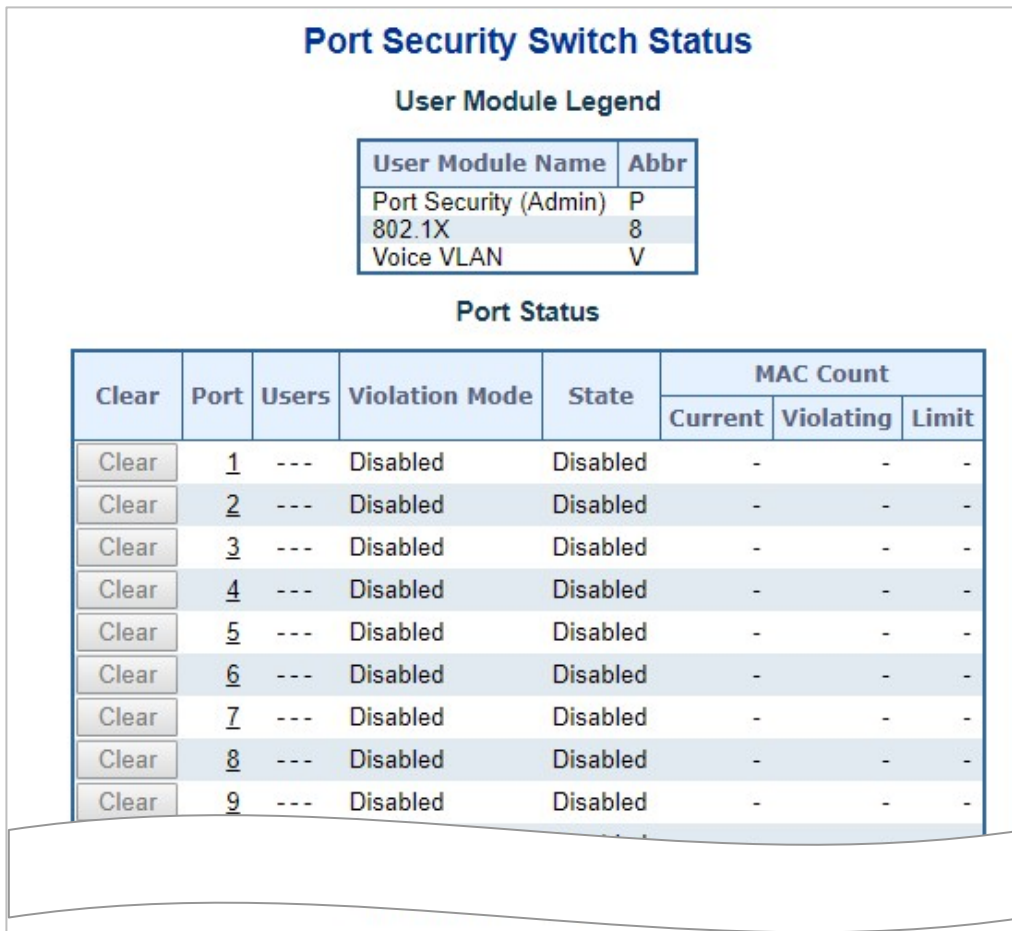

Figure 4-6-4-2: Port Security Status Screen Page Screenshot

The page includes the following fields:

User Module Legend

The legend shows all user modules that may request Port Security services.

Object	Description
<ul style="list-style-type: none"> • User Module Name 	The full name of a module that may request Port Security services.
<ul style="list-style-type: none"> • Abbr 	A one-letter abbreviation of the user module. This is used in the Users column in the port status table.

Port Status

The table has one row for each port on the selected switch in the switch and a number of columns, which are:

Object	Description
<ul style="list-style-type: none"> • Clear 	Click to remove all MAC addresses on all VLANs on this port. The button is only clickable if number of secured MAC addresses is non-zero.
<ul style="list-style-type: none"> • Port 	The port number for which the status applies. Click the port number to see the status for this particular port.
<ul style="list-style-type: none"> • Users 	Each of the user modules has a column that shows whether that module has enabled Port Security or not. A '-' means that the corresponding user module is not enabled, whereas a letter indicates that the user module abbreviated by that letter has enabled port security.
<ul style="list-style-type: none"> • Violation Mode 	Shows the configured Violation Mode of the port. It can take one of four values: Disabled: Port Security is not administratively enabled on this port. Protect: Port Security is administratively enabled in Protect mode. Restrict: Port Security is administratively enabled in Restrict mode. Shutdown: Port Security is administratively enabled in Shutdown mode.
<ul style="list-style-type: none"> • State 	Shows the current state of the port. It can take one of four values: <ul style="list-style-type: none"> ■ Disabled: No user modules are currently using the Port Security service. ■ Ready: The Port Security service is in use by at least one user module, and is awaiting frames from unknown MAC addresses to arrive. ■ Limit Reached: The Port Security service is enabled by at least the Limit Control user module, and that module has indicated that the limit is reached and no more MAC addresses should be taken in. ■ Shutdown: The Port Security service is enabled by at least the Limit Control user module, and that module has indicated that the limit is exceeded. No MAC addresses can be learned on the port until it is administratively re-opened on the Limit Control configuration web page.
<ul style="list-style-type: none"> • MAC Count (Current, Limit) 	The two columns indicate the number of currently learned MAC addresses (forwarding as well as blocked) and the maximum number of MAC addresses that can be learned on the port, respectively. If no user modules are enabled on the port, the Current column will show a dash (-). If the Limit Control user module is not enabled on the port, the Limit column will show a dash (-).

4.6.4.3 Port Security Detail

This page shows the MAC addresses secured by the Port Security module. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise. The Port Security Detail screen in [Figure 4-6-4-3](#) appears.

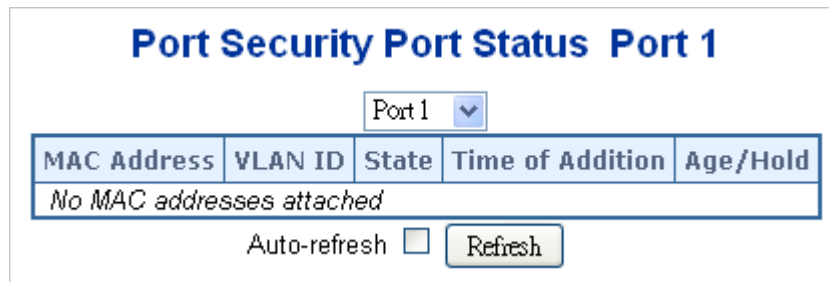

Figure 4-6-4-3: Port Security Detail Screen Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • MAC Address & VLAN ID 	The MAC address and VLAN ID that is seen on this port. If no MAC addresses are learned, a single row stating "No MAC addresses attached" is displayed.
<ul style="list-style-type: none"> • State 	Indicates whether the corresponding MAC address is blocked or forwarding. In the blocked state, it will not be allowed to transmit or receive traffic.
<ul style="list-style-type: none"> • Time of Addition 	Shows the date and time when this MAC address was first seen on the port.
<ul style="list-style-type: none"> • Age/Hold 	<ul style="list-style-type: none"> • If at least one user module has decided to block this MAC address, it will stay in the blocked state until the hold time (measured in seconds) expires. • If all user modules have decided to allow this MAC address to forward, and aging is enabled, the Port Security module will periodically check that this MAC address still forwards traffic. • If the age period (measured in seconds) expires and no frames have been seen, the MAC address will be removed from the MAC table. Otherwise a new age period will begin. • If aging is disabled or a user module has decided to hold the MAC address indefinitely, a dash (-) will be shown.

4.6.4.4 MAC Address

On this page, you may add and delete static and sticky MAC addresses managed by Port Security.

Port security defines three types of MAC addresses, of which static and sticky can be added and removed on this page:

- **Dynamic:** A MAC address learned through learn frames coming to the Port Security module while the interface in question is not in sticky mode. Dynamic entries disappear if it ages out or if the interface link goes down.
- **Static:** A MAC address added by end-user through management. Static MAC addresses are not subject to aging and will be added to the MAC address table once Port Security gets enabled on the interface. Static entries are part of the running-config and will survive interface link state changes and reboots if saved to startup-config. Static entries can be added to the running-config at any time whether or not Port Security is enabled.
- **Sticky:** When the interface is in sticky mode, all entries that would otherwise have been learned as dynamic are learned as sticky.

Like static entries, sticky entries are part of the running-config and will survive interface link state changes and reboots if saved to the startup-config.

Though not the intention with Sticky entries, they can be added by management to the running-config at any time whether or not Port Security is enabled on the interface, as long as the interface is in Sticky mode. Sticky entries will disappear if the interface is taken out of Sticky mode.

Refresh

Delete	Port	VLAN ID	MAC Address	Type
Add New MAC Entry				
Apply		Reset		

The table contains one row per static or sticky MAC address.

Object	Description
<ul style="list-style-type: none"> • Delete 	Press this button to remove the entry from the MAC address table (if present) and the running-config. Notice that dynamic entries may be removed all-together on an interface through "Monitor→Security→Port Security→Switch" and one-by-one through "Monitor→Security→Port Security→Port"
<ul style="list-style-type: none"> • Port 	The port number to which this MAC address is bound.
<ul style="list-style-type: none"> • VLAN ID & MAC Address 	The VLAN ID and MAC address in question.
<ul style="list-style-type: none"> • Type 	Indicates the type of entry and may be either Static or Sticky (see description above).

Buttons

: Clicking this button will add a new row to the table. This new row allows for adding a static or sticky MAC address to a particular interface. Once satisfied, click the Save-button to save the changes to running-config.

Notice that sticky entries are normally added automatically through learning on the interface.

: Click to refresh the page. Note that non-committed changes will be lost.

: Click to save changes.

: Click to undo any changes made locally and revert to previously saved values.

4.6.5 Access Control Lists

ACL is an acronym for Access Control List. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program.

Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

ACE is an acronym for **Access Control Entry**. It describes access permission associated with a particular ACE ID.

There are three ACE frame types (**Ethernet Type**, **ARP**, and **IPv4**) and two ACE actions (**permit** and **deny**). The ACE also contains many detailed, different parameter options that are available for individual application.

4.6.5.1 ACL Status

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. The maximum number of ACEs is **512** on each switch. The Voice VLAN OUI Table screen in [Figure 4-6-5-1](#) appears.

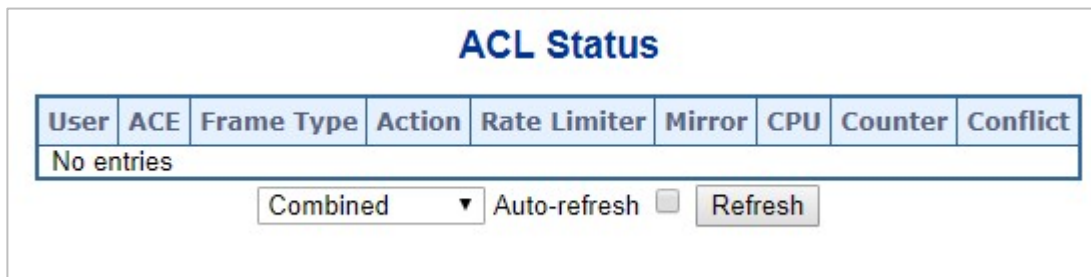

Figure 4-6-5-1: ACL Status Page Screenshot

The page includes the following fields:

Object	Description
• User	Indicates the ACL user.
• ACE	Indicates the ACE ID on local switch.

<ul style="list-style-type: none"> • Frame Type 	<p>Indicates the frame type of the ACE. Possible values are:</p> <ul style="list-style-type: none"> ■ Any: The ACE will match any frame type. ■ EType: The ACE will match Ethernet Type frames. Note that an Ethernet Type based ACE will not get matched by IP and ARP frames. ■ ARP: The ACE will match ARP/RARP frames. ■ IPv4: The ACE will match all IPv4 frames. ■ IPv4/ICMP: The ACE will match IPv4 frames with ICMP protocol. ■ IPv4/UDP: The ACE will match IPv4 frames with UDP protocol. ■ IPv4/TCP: The ACE will match IPv4 frames with TCP protocol. ■ IPv4/Other: The ACE will match IPv4 frames, which are not ICMP/UDP/TCP. ■ IPv6: The ACE will match all IPv6 standard frames.
<ul style="list-style-type: none"> • Action 	<p>Indicates the forwarding action of the ACE.</p> <ul style="list-style-type: none"> ■ Permit: Frames matching the ACE may be forwarded and learned. ■ Deny: Frames matching the ACE are dropped.
<ul style="list-style-type: none"> • Rate Limiter 	<p>Indicates the rate limiter number of the ACE. The allowed range is 1 to 16. When Disabled is displayed, the rate limiter operation is disabled.</p>
<ul style="list-style-type: none"> • CPU 	<p>Forward packet that matched the specific ACE to CPU</p>
<ul style="list-style-type: none"> • Counter 	<p>The counter indicates the number of times the ACE was hit by a frame.</p>
<ul style="list-style-type: none"> • Conflict 	<p>Indicates the hardware status of the specific ACE. The specific ACE is not applied to the hardware due to hardware limitations.</p>

4.6.5.2 ACL Configuration

This page shows the Access Control List (ACL), which is made up of the ACEs defined on this switch. Each row describes the ACE that is defined. The maximum number of ACEs is **512** on each switch.

Click on the lowest plus sign to add a new ACE to the list. The reserved ACEs used for internal protocol, cannot be edited or deleted, the order sequence cannot be changed and the priority is highest. The Access Control List Configuration screen in [Figure 4-6-5-2](#) appears.

Figure 4-6-5-2: Access Control List Configuration Page Screenshot

The page includes the following fields:

Object	Description
• ACE	Indicates the ACE ID.
• Ingress Port	Indicates the ingress port of the ACE. Possible values are: <ul style="list-style-type: none"> ■ All: The ACE will match all ingress port. ■ Port: The ACE will match a specific ingress port.
• Policy / Bitmask	Indicates the policy number and bitmask of the ACE.
• Frame Type	Indicates the frame type of the ACE. Possible values are: <ul style="list-style-type: none"> ■ Any: The ACE will match any frame type. ■ EType: The ACE will match Ethernet Type frames. Note that an Ethernet Type based ACE will not get matched by IP and ARP frames. ■ ARP: The ACE will match ARP/RARP frames. ■ IPv4: The ACE will match all IPv4 frames. ■ IPv4/ICMP: The ACE will match IPv4 frames with ICMP protocol. ■ IPv4/UDP: The ACE will match IPv4 frames with UDP protocol. ■ IPv4/TCP: The ACE will match IPv4 frames with TCP protocol. ■ IPv4/Other: The ACE will match IPv4 frames, which are not ICMP/UDP/TCP. ■ IPv6: The ACE will match all IPv6 standard frames.

<ul style="list-style-type: none"> • Action 	<p>Indicates the forwarding action of the ACE.</p> <ul style="list-style-type: none"> ■ Permit: Frames matching the ACE may be forwarded and learned. ■ Deny: Frames matching the ACE are dropped. ■ Filter: Frames matching the ACE are filtered.
<ul style="list-style-type: none"> • Rate Limiter 	<p>Indicates the rate limiter number of the ACE. The allowed range is 1 to 16. When Disabled is displayed, the rate limiter operation is disabled.</p>
<ul style="list-style-type: none"> • Port Redirect 	<p>Indicates the port redirect operation of the ACE. Frames matching the ACE are redirected to the port number.</p> <p>The allowed values are Disabled or a specific port number. When Disabled is displayed, the port redirect operation is disabled.</p>
<ul style="list-style-type: none"> • Mirror 	<p>Specify the mirror operation of this port. Frames matching the ACE are mirrored to the destination mirror port. The allowed values are:</p> <p>Enabled: Frames received on the port are mirrored.</p> <p>Disabled: Frames received on the port are not mirrored.</p> <p>The default value is "Disabled".</p>
<ul style="list-style-type: none"> • Counter 	<p>The counter indicates the number of times the ACE was hit by a frame.</p>
<ul style="list-style-type: none"> • Modification Buttons 	<p>You can modify each ACE (Access Control Entry) in the table using the following buttons:</p> <ul style="list-style-type: none"> : Inserts a new ACE before the current row. : Edits the ACE row. : Moves the ACE up the list. : Moves the ACE down the list. : Deletes the ACE. : The lowest plus sign adds a new entry at the bottom of the ACE listings.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

: Click to refresh the page; any changes made locally will be undone.

: Click to clear the counters.

: Click to remove all ACEs.

4.6.5.3 ACL Ports Configuration

Configure the ACL parameters (ACE) of each switch port. These parameters will affect frames received on a port unless the frame matches a specific ACE. The ACL Ports Configuration screen in [Figure 4-6-5-4](#) appears.

ACL Ports Configuration

Port	Policy ID	Action	Rate Limiter ID	Port Redirect	Mirror	Logging	Shutdown	State	Counter
*	0	<All> ▼	<All> ▼	<All> ▼	<All> ▼	<All> ▼	<All> ▼	<All> ▼	*

9	0	Permit ▼	Disabled ▼	Disabled ▼	Disabled ▼	Disabled ▼	Disabled ▼	Enabled ▼	0

Figure 4-6-5-4: ACL Ports Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings contained in the same row.
• Policy ID	Select the policy to apply to this port. The allowed values are 0 through 255 . The default value is 0.
• Action	Select whether forwarding is permitted ("Permit") or denied ("Deny"). The default value is "Permit".
• Rate Limiter ID	Select which rate limiter to apply on this port. The allowed values are Disabled or the values 1 through 16 . The default value is "Disabled".
• Port Redirect	Select which port frames are redirected on. The allowed values are Disabled or a specific port number and it can't be set when action is permitted. The default value is "Disabled".
• Mirror	Specify the mirror operation of this port. The allowed values are: Enabled : Frames received on the port are mirrored. Disabled : Frames received on the port are not mirrored. The default value is "Disabled".
• Logging	Specify the logging operation of this port. The allowed values are: ■ Enabled : Frames received on the port are stored in the System Log. ■ Disabled : Frames received on the port are not logged. The default value is "Disabled". Please note that the System Log memory size and logging rate are limited.

<ul style="list-style-type: none"> • Shutdown 	<p>Specify the port shut down operation of this port. The allowed values are:</p> <ul style="list-style-type: none"> ■ Enabled: If a frame is received on the port, the port will be disabled. ■ Disabled: Port shut down is disabled. <p>The default value is "Disabled".</p>
<ul style="list-style-type: none"> • State 	<p>Specify the port state of this port. The allowed values are:</p> <ul style="list-style-type: none"> ■ Enabled: To reopen ports by changing the volatile port configuration of the ACL user module. ■ Disabled: To close ports by changing the volatile port configuration of the ACL user module. <p>The default value is "Enabled".</p>
<ul style="list-style-type: none"> • Counter 	<p>Counts the number of frames that match this ACE.</p>

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

: Click to refresh the page; any changes made locally will be undone.

: Click to clear the counters.

4.6.5.4 ACL Rate Limiters

Configure the rate limiter for the ACL of the switch.

The ACL Rate Limiter Configuration screen in [Figure 4-6-5-5](#) appears.

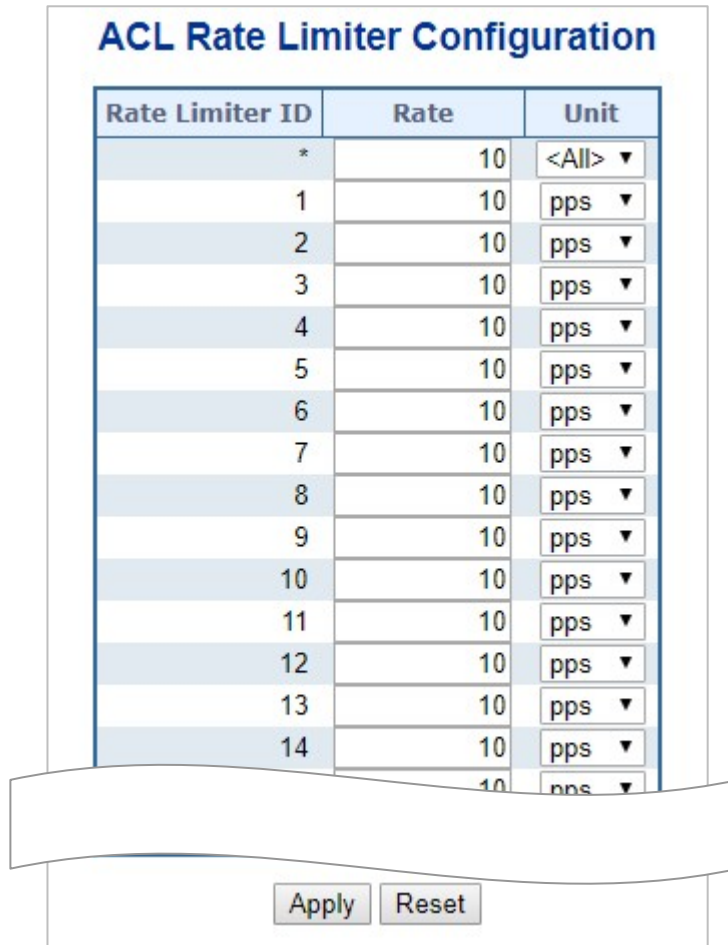

Figure 4-6-5-5: ACL Rate Limiter Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Rate Limiter ID	The rate limiter ID for the settings contained in the same row.
• Rate (pps)	The allowed values are: 0-3276700 in pps or 0, 100, 200, 300, ..., 1000000 in kbps.
• Unit	Specify the rate unit. The allowed values are: pps : packets per second. kbps : Kbits per second.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.6 DHCP Snooping

DHCP Snooping is used to block intruder on the untrusted ports of DUT when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server.

DHCP Snooping Overview

Configure DHCP Snooping on this page. The DHCP Snooping Configuration screen in [Figure 4-6-6](#) appears.

4.6.6.1 DHCP Snooping Configuration

Configure DHCP Snooping on this page. in [Figure 4-6-6-1](#) appears.

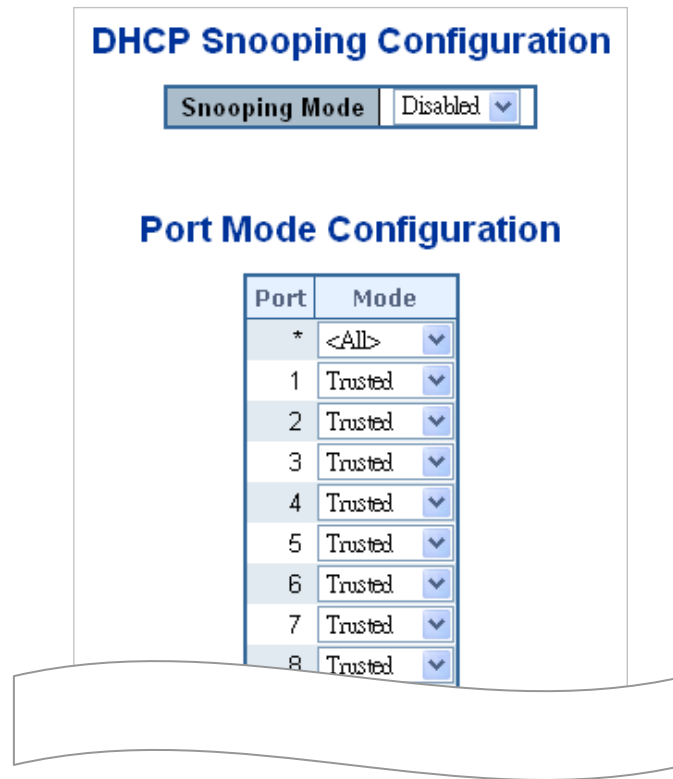

Figure 4-6-6-1: DHCP Snooping Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Snooping Mode 	<p>Indicates the DHCP snooping mode operation. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable DHCP snooping mode operation. When enable DHCP snooping mode operation, the request DHCP messages will be forwarded to trusted ports and only allowed reply packets from trusted ports. ■ Disabled: Disable DHCP snooping mode operation.
<ul style="list-style-type: none"> Port Mode Configuration 	<p>Indicates the DHCP snooping port mode. Possible port modes are:</p> <ul style="list-style-type: none"> ■ Trusted: Configures the port as trusted sources of the DHCP message. ■ Untrusted: Configures the port as untrusted sources of the DHCP message.

Buttons

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.6.2 Dynamic DHCP Snooping Table

This page display the dynamic IP assigned information after DHCP Snooping mode is disabled. All DHCP clients obtained the dynamic IP address from the DHCP server will be listed in this table except for local VLAN interface IP addresses. Entries in the Dynamic DHCP snooping Table are shown on this page. The Dynamic DHCP Snooping Table screen in [Figure 4-6-6-2](#) appears.

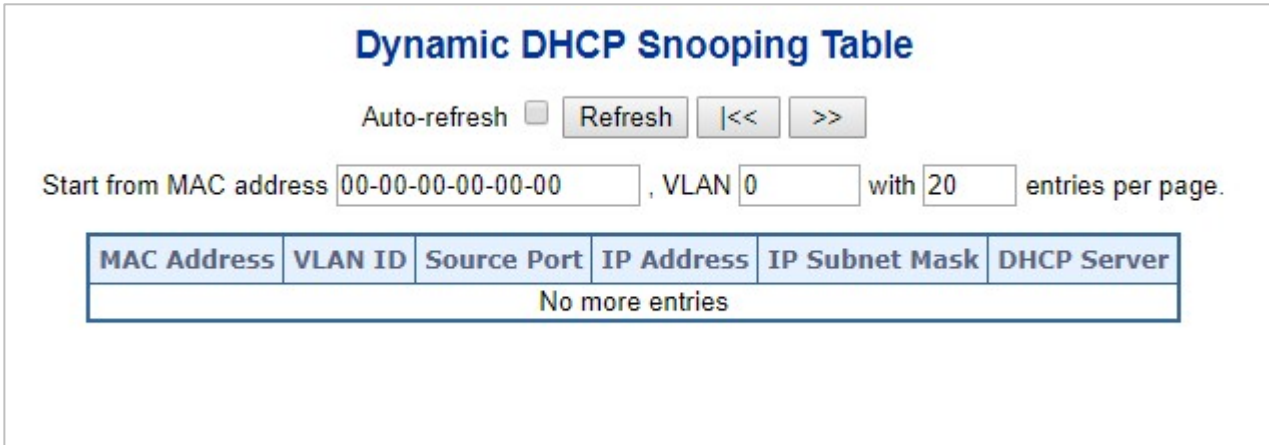

Figure 4-6-6-2: Dynamic DHCP Snooping Table Screen Page Screenshot

Object	Description
• MAC Address	User MAC address of the entry.
• VLAN ID	VLAN-ID in which the DHCP traffic is permitted.
• Source Port	Switch Port Number for which the entries are displayed.
• IP Address	User IP address of the entry.
• IP Subnet Mask	User IP subnet mask of the entry.
• DHCP Server Address	DHCP Server address of the entry.

Buttons

Auto-refresh : Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh: Refreshes the displayed table starting from the input fields

Clear: Flushes all dynamic entries.

>>: It will use the last entry of the currently displayed table as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table

<<: To start over

4.6.7 DHCPv6 Snooping

<ul style="list-style-type: none"> • Unknown IPv6 Next-Headers 	<p>Indicates how Unknown IPv6 Next-Header values should be treated. The switch needs to parse all IPv6 packets to a DHCPv6 client to determine if it is in fact a DHCPv6 message. If an unknown IPv6 extension header is encountered the parsing cannot continue. See RFC 7610, section 5, item 3 for details.</p> <p>Possible options are:</p> <p>Drop: Drop packets with unknown IPv6 extension headers. This is the most secure option but may result in traffic disruptions.</p> <p>Allow: Allow packets with unknown IPv6 extension headers. This is a less secure option but prevents traffic disruptions.</p>
<ul style="list-style-type: none"> • Port Mode Configuration 	<p>Indicates the DHCPv6 snooping port mode.</p> <p>Possible port modes are:</p> <p>Trusted: Configures the port as trusted source of the DHCPv6 messages.</p> <p>Untrusted: Configures the port as untrusted source of the DHCPv6 messages.</p>

4.6.8 IP Source Guard

4.6.8.1 IP Source Guard Configuration

IP Source Guard is a secure feature used to restrict IP traffic on **DHCP snooping untrusted ports** by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host. This page provides IP Source Guard related configuration. The IP Source Guard Configuration screen in [Figure 4-6-8-1](#) appears.

4.6.10 ARP Inspection

4.6.10.1 ARP Inspection

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through DUT. This page provides ARP Inspection related configuration. The ARP Inspection Configuration screen in [Figure 4-6-10-1](#) appears.

ARP Inspection Configuration

Figure 4-6-10-1: ARP Inspection Configuration Screen Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Mode of ARP Inspection Configuration 	<p>Enable the Global ARP Inspection or disable the Global ARP Inspection.</p>
<ul style="list-style-type: none"> • Port Mode Configuration 	<p>Specify ARP Inspection is enabled on which ports. Only when both Global Mode and Port Mode on a given port are enabled, ARP Inspection is enabled on this given port. Possible modes are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable ARP Inspection operation. ■ Disabled: Disable ARP Inspection operation. <p>If you want to inspect the VLAN configuration, you have to enable the setting of "Check VLAN". The default setting of "Check VLAN" is disabled. When the setting of "Check VLAN" is disabled, the log type of ARP Inspection will refer to the port setting. And the setting of "Check VLAN" is enabled, the log type of ARP Inspection will refer to the VLAN setting. Possible setting of "Check VLAN" are:</p> <ul style="list-style-type: none"> ■ Enabled: Enable check VLAN operation. ■ Disabled: Disable check VLAN operation. <p>Only the Global Mode and Port Mode on a given port are enabled, and the setting of "Check VLAN" is disabled, the log type of ARP Inspection will refer to the port setting. There are four log types and possible types are:</p> <ul style="list-style-type: none"> ■ None: Log nothing. ■ Deny: Log denied entries. ■ Permit: Log permitted entries. ■ ALL: Log all entries.

Buttons

: Click to translate all dynamic entries to static entries.

: Click to apply changes

: Click to undo any changes made locally and revert to previously saved values.

4.6.10.2 VLAN Configuration

This page provides ARP Inspection related configuration.

Navigating the VLAN Configuration

Each page shows up to 9999 entries from the VLAN table, default being 20, selected through the "entries per page" input field. When first visited, the web page will show the first 20 entries from the beginning of the VLAN Table. The first displayed will be the one with the lowest VLAN ID found in the VLAN Table.

The "VLAN" input fields allow the user to select the starting point in the VLAN Table. Clicking the  button will update the displayed table starting from that or the closest next VLAN Table match. The  will use the next entry of the currently displayed VLAN entry as a basis for the next lookup. When the end is reached the warning message is shown in the displayed table. Use the  button to start over.

VLAN Mode Configuration

Start from VLAN with entries per page.

The displayed settings are:

Object	Description
<ul style="list-style-type: none"> VLAN Mode Configuration 	<p>Specify ARP Inspection is enabled on which VLANs. First, you have to enable the port setting on Port mode configuration web page. Only when both Global Mode and Port Mode on a given port are enabled, ARP Inspection is enabled on this given port. Second, you can specify which VLAN will be inspected on VLAN mode configuration web page. The log type also can be configured on per VLAN setting.</p> <p>Possible types are:</p> <p>None: Log nothing.</p> <p>Deny: Log denied entries.</p> <p>Permit: Log permitted entries.</p> <p>ALL: Log all entries.</p>

Buttons

: Click to add a new VLAN to the ARP Inspection VLAN table.

: Click to apply changes.

: Click to undo any changes made locally and revert to previously saved values.

4.6.10.3 ARP Inspection Static Table

This page provides Static ARP Inspection Table. The Static ARP Inspection Table screen in [Figure 4-6-10-2](#) appears.

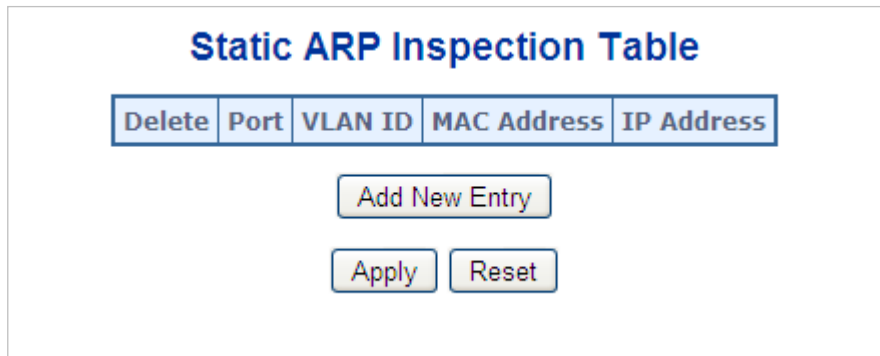

Figure 4-6-10-2: Static ARP Inspection Table Screen Page Screenshot

The page includes the following fields:

Object	Description
• Delete	Check to delete the entry. It will be deleted during the next save.
• Port	The logical port for the settings.
• VLAN ID	The VLAN ID for the settings.
• MAC Address	Allowed Source MAC address in ARP request packets.
• IP Address	Allowed Source IP address in ARP request packets.

Buttons

Add New Entry: Click to add a new entry to the Static ARP Inspection table.

Apply: Click to apply changes

Reset: Click to undo any changes made locally and revert to previously saved values.

4.6.10.4 Dynamic ARP Inspection Table

Entries in the Dynamic ARP Inspection Table are shown on this page. The Dynamic ARP Inspection Table contains up to 1024 entries, and is sorted first by port, then by VLAN ID, then by MAC address, and then by IP address. The Dynamic ARP Inspection Table screen in [Figure 4-6-10-3](#) appears.

Figure 4-6-10-3: Dynamic ARP Inspection Table Screenshot

Navigating the ARP Inspection Table

Each page shows up to 99 entries from the Dynamic ARP Inspection table, default being 20, selected through the "entries per Page" input field. When first visited, the web page will show the first 20 entries from the beginning of the Dynamic ARP Inspection Table.

The "Start from port address", "VLAN", "MAC address" and "IP address" input fields allow the user to select the starting point in the Dynamic ARP Inspection Table. Clicking the "Refresh" button will update the displayed table starting from that or the closest next Dynamic ARP Inspection Table match. In addition, the two input fields will - upon a "Refresh" button click - assume the value of the first displayed entry, allowing for continuous refresh with the same start address.

The ">>" will use the last entry of the currently displayed as a basis for the next lookup. When the end is reached the text "No more entries" is shown in the displayed table. Use the "<<" button to start over. The page includes the following fields:

Object	Description
• Port	The port number for which the status applies. Click the port number to see the status for this particular port.
• VLAN ID	The VLAN ID of the entry.
• MAC Address	The MAC address of the entry.
• IP Address	The IP address of the entry.

Buttons

Auto-refresh Check this box to refresh the page automatically. Automatic refresh occurs every 3 seconds.

Refresh : Refreshes the displayed table starting from the "Start from MAC address" and "VLAN" input fields.

Clear : Flushes all dynamic entries.

<< : Updates the table starting from the first entry in the MAC Table, i.e. the entry with the lowest VLAN ID and MAC address.

>> : Updates the table, starting with the entry after the last entry currently displayed.

4.7 Ring

4.7.1 Ring Wizard

This page is on ring wizard and it is an interface for user to configure ERPS ring feature.

This wizard uses the fixed ring topology to indicate the ring owner, so if user needs to indicate the other switch to the ring owner or modify the ring topology, please modify MEP and ERPS settings manually.

If user wants to enable the ERPS ring, please disable the DHCP client feature and indicate the ring port that cannot be the Spanning Tree port.

Ring Wizard

Note:
 1. Please make sure the DHCP client function has been disabled.
 2. Please be noticed that the ring port can not be applied to spanning tree function at the same time.

Total Switch Number (3 ~ 30):
 Switch ID:

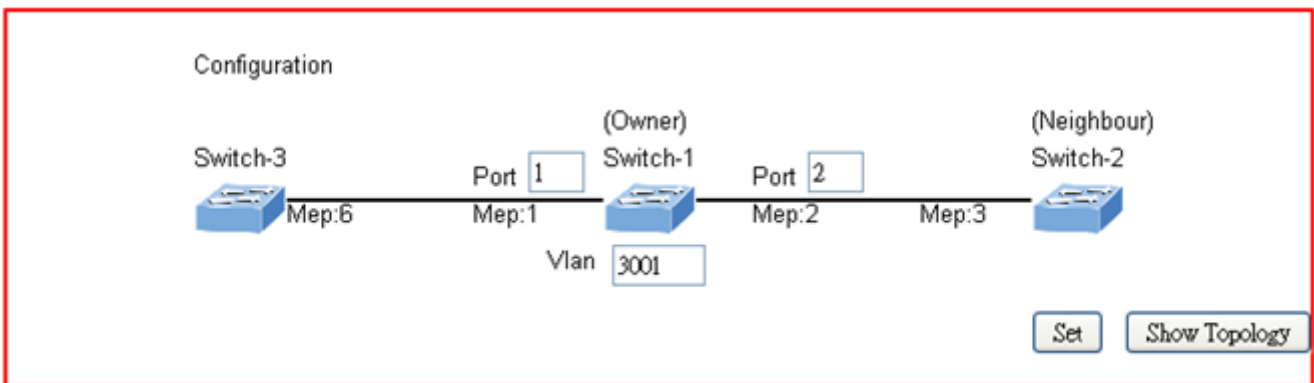

Figure: Ring Wizard page screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> All Switch Numbers (3 ~ 30) 	This option is for you to input a number to show how many switches will be used for the single ring. Ring wizard needs at least 3 switches for configuring and the maximum number is 30.
<ul style="list-style-type: none"> Number ID 	This option is for you to input a number that the ID of the switch you are setting for the single ring. For example, a single ring is grouped by 10 switches. If you want to set the ERPS ring wizard from the 2nd switch, you will have to input 2 for the Number ID option.
<ul style="list-style-type: none"> Next Button 	When you press the "Next" button, the system is going to generate the ERPS ring setting according to your setting.

• Ring Wizard Setting
Example

[10 Switches For Single Ring]

1.We will create a ring by 10 switches and we are configuring the first switch, so the configuration should be as follows:

2.We are creating a ring that it is built by 10 switches and we are configuring the 2nd switch.

3.We are creating a ring that it is built by 10 switches and we are configuring the 10th switch.

Ring Wizard Example:

ERPS Ring for Video Transmission Redundancy

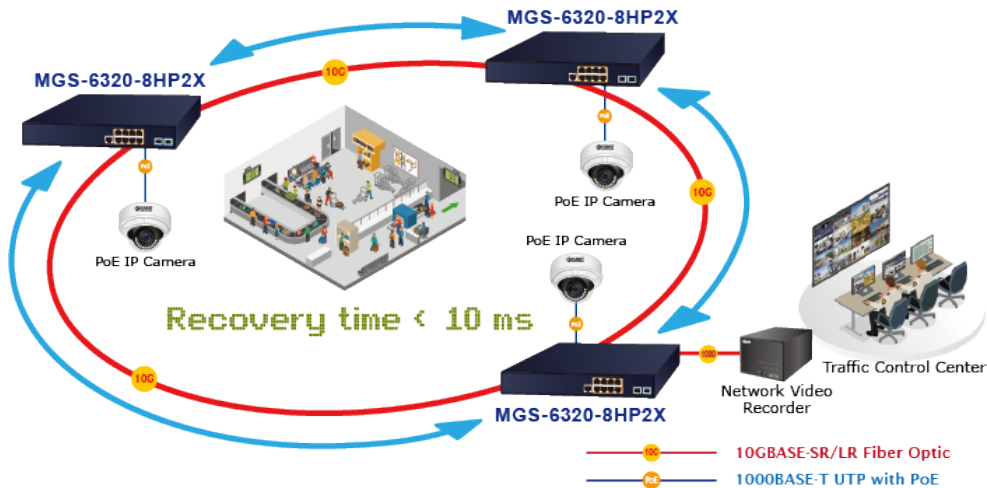

Figure 4-8-1: Ring Example Diagram

The above topology often occurs on using ERPS protocol. The multi switch constitutes a single ERPS ring; all of the switches only are configured as an ERPS in VLAN 3001, thereby constituting a single MRPP ring.

Switch ID	Port	MEP ID	RPL Type	VLAN Group
Switch 1	Port 1	1	None	3001
	Port 2	2	Owner	3001
Switch 2	Port 1	4	None	3001
	Port 2	3	Neighbor	3001
Switch 3	Port 1	6	None	3001
	Port 2	5	None	3001

Table 4-8-2: ERPS Configuration Table

The scenario described as follows:

1. Disable DHCP client and set proper static IP for Switch 1, 2 & 3. In this example, switch 1 is 192.168.0.101; switch 2 is 192.168.0.102 and switch 3 is 192.168.0.103.
2. On switch 1, 2 & 3, disable spanning tree protocol to avoid confliction with ERPS.

Setup steps

Set ERPS Configuration on Switch 1

Connect PC to switch 1 directly; don't connect to port 1 & 2

Logging on the Switch 1 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 1; click "Next" button to set the ERPS configuration for Switch 1.

Set "MEP1" = Port1, "MEP2" = Port2 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 1.

Set ERPS Configuration on Switch 2

Connect PC to switch 2 directly; don't connect to port 1 & 2

Logging on the Switch 2 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 2; click "Next" button to set the ERPS configuration for Switch 2.

Set "MEP3" = Port2, "MEP4" = Port1 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 2.

Set ERPS Configuration on Switch 3

Connect PC to switch 3 directly; don't connect to port 1 & 2

Logging on the Switch 3 and click "Ring > Ring Wizard"

Set "All Switch Number" = 3 and "Number ID" = 3; click "Next" button to set the ERPS configuration for Switch 3.

Set "MEP5" = Port2, "MEP6" = Port1 and VLAN ID = 3001; click "Set" button to save the ERPS configuration for Switch 3.

To avoid loop, please don't connect switch 1, 2 & 3 together in the ring topology before configuring the end of ERPS .

Follow the configuration or ERPS wizard to connect the Switch 1, 2 and 3 together to establish ERPS application:

MEP2 ↔ MEP3 = Switch1 / Port2 ↔ Switch2 / Port2

MEP4 ↔ MEP5 = Switch2 / Port1 ↔ Switch3 / Port2

MEP1 ↔ MEP6 = Switch1 / Port1 ↔ Switch3 / Port1

4.7.2 ERPS

The ERPS instances are configured here.

4.7.4 APS

4.7.4.1 APS Configuration

The APS module implements the protocol and linear protection switching mechanisms for point-to-point VLAN-based ETH SNC in Ethernet transport networks. Automatic Protection Switching is defined by the ITU G.8031 standard.

This page allows the user to create and configure an [APS](#) Instance.

APS Configuration

APS #	Working			Protecting			Mode	Level	VLAN	PCP	SMAC	Rev	TxAps	WTR	HoldOff	Enable	Oper	Warning	
	Port	SF Trigger	SF MEP	Port	SF Trigger	SF MEP													
⊕																			

The displayed settings are:

APS Protocol:

Object	Description
• APS #	The ID of the APS. Maximum number of creatable APS instances is 10 . Click on link to get to APS instance page, you can reset counters and issue commands.
• Port	The Port this flow is attached to.
• SF Trigger	Selects whether Signal Fail (SF) comes from the link state of a given Port, or from a Down-MEP.
• SF MEP	The Domain::Service::MEPID refers to a MEP instance which shall represent the Working flow. Only used when SF Trigger is MEP. The selected MEP instance does not need to exist when this APS is configured.
• Mode	1:1 This will create a 1:1 APS.
• Level	MD/MEG Level (0-7).
• VLAN	The VLAN ID used in the L-APS PDUs. 0 means untagged.
• PCP	PCP (priority) (default 7). The PCP value used in the VLAN tag unless the L-APS PDU is untagged. Must be a value in range 0 - 7.
• SMAC	Source MAC address used in L-APS PDUs. Must be a unicast address. If all-zeros, the switch port's MAC address will be used.

<ul style="list-style-type: none"> • Rev 	<p>When checked, the port recovery mode is revertive, that is, traffic switches back to the working port after the condition(s) causing a switch has cleared. In the case of clearing a command (e.g. forced switch), this happens immediately. In the case of clearing of a defect, this generally happens after the expiry of the WTR (Wait-To-Restore) timer.</p> <p>When unchecked, the port recovery mode is non-revertive and traffic is allowed to remain on the protect port after a switch reason has cleared.</p>
<ul style="list-style-type: none"> • TxAps 	<p>Choose whether this end transmits APS PDUs. Only used for 1+1, unidirectional.</p>
<ul style="list-style-type: none"> • WTR 	<p>When Rev is checked, WTR (Wait-To-Restore) tells how many seconds to wait before restoring to the working port after a fault condition has cleared. Valid range 1 - 720</p>
<ul style="list-style-type: none"> • HoldOff 	<p>When a new (or more severe) defect occurs, the hold-off timer will be started and the event will be reported after the timer expires. HoldOff time is measured in milliseconds, and valid values are in the range 0 - 10000. Default is 0, which means immediate reporting of the defect.</p>
<ul style="list-style-type: none"> • Enable 	<p>The administrative state of this APS instance. Check to make it function normally and uncheck to make it cease functioning.</p>
<ul style="list-style-type: none"> • Oper 	<p>This field can not be configured, but shows the operational state. You can click on the link in the APS # field to get more details on the status.</p> <p> APS instance is functional.</p> <p> APS instance is not functional.</p>
<ul style="list-style-type: none"> • Warning 	<p>If the operational state is Active, the APS instance is indeed active, but it may be that it doesn't run as the administrator thinks, because of configuration errors, which are reflected in the warnings below.</p> <p>The Warning information is indicated by  : no warning,  : warning. Use the tooltip to get the detailed warning information.</p>
<ul style="list-style-type: none"> • Configuration Buttons 	<p>You can modify each APS in the table using the following buttons:</p> <p> : Edits the APS row.</p> <p> : Deletes the APS.</p> <p> : Adds new APS.</p>

4.8 Maintenance

4.8.1 Switch Maintenance

4.8.1.1 Web Firmware Upgrade

This page facilitates an update of the firmware controlling the switch. The Web Firmware Upgrade screen in [Figure 4-10-1-1](#) appears.

Figure 4-10-1-1: Web Firmware Upgrade Page Screenshot

To open **Firmware Upgrade** screen, perform the following:

1. Click **Maintenance** -> Web **Firmware Upgrade**.
2. The Firmware Upgrade screen is displayed as in [Figure 4-10-1-1](#).
3. Click the "**Choose File**" button of the Main page; the system would pop up the file selection menu to choose firmware.
4. Select on the firmware and then click "**Upload**". The **Software Upload Progress** would show the file with upload status.
5. Once the software is loaded to the system successfully, the following screen appears. The system will load the new software after reboot.

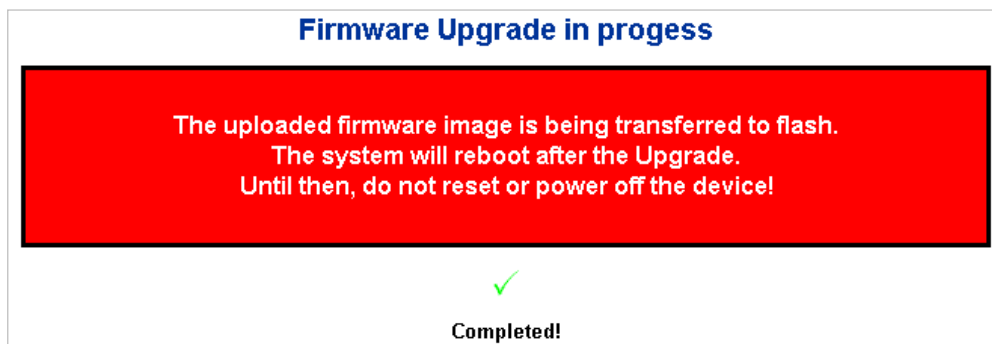

Figure 4-10-1-2: Software Successfully Loaded Notice Screen

DO NOT Power OFF the Managed Switch until the update progress is complete.

Do not quit the Firmware Upgrade page without pressing the **“OK”** button after the image is loaded. Or the system won't apply the new firmware. User has to repeat the firmware upgrade processes.

4.8.1.2 Save Startup Config

This function allows to save the current configuration, thereby ensuring that the current active configuration can be used at the next reboot as the screen in [Figure 4-10-2-1](#) appears. After saving the configuration, the screen in [Figure 4-10-2-2](#) will appear.

Figure 4-10-2-1: Configuration Save Page Screenshot

Figure 4-10-2-2: Finish Saving Page Screenshot

4.8.1.3 Configuration Download

The switch stores its configuration in a number of text files in CLI format. The files are either virtual (RAM-based) or stored in flash on the switch.

There are three system files:

- running-config: A virtual file that represents the currently active configuration on the switch. This file is volatile.
- startup-config: The startup configuration for the switch, read at boot time.
- default-config: A read-only file with vendor-specific configuration. This file is read when the system is restored to default settings.

It is also possible to store up to two other files and apply them to running-config, thereby switching configuration.

Configuration Download page allows the download the running-config, startup-config and default-config on the switch. Please refer to the [Figure 4-10-3](#) shown below.

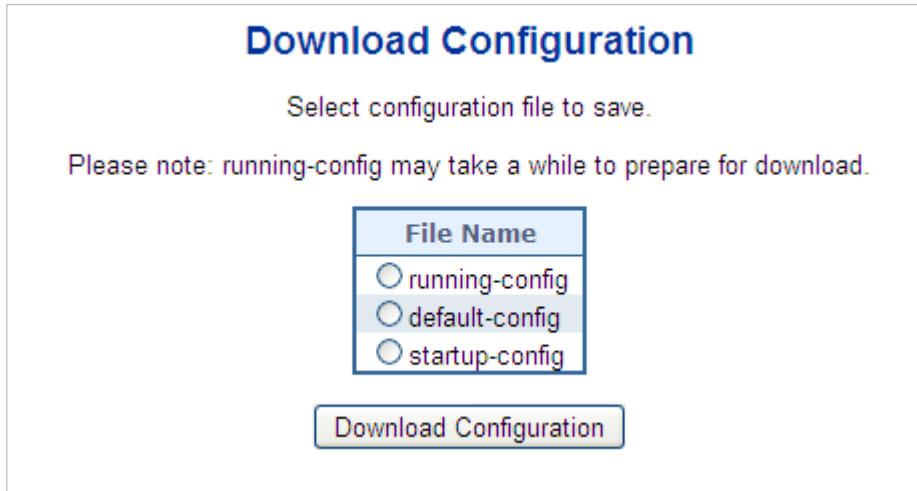

Figure 4-10-3: Configuration Download Page Screenshot

4.8.1.4 Configuration Upload

Configuration Upload page allows the upload the running-config and startup-config on the switch. Please refer to the Figure 4-10-4 shown below.

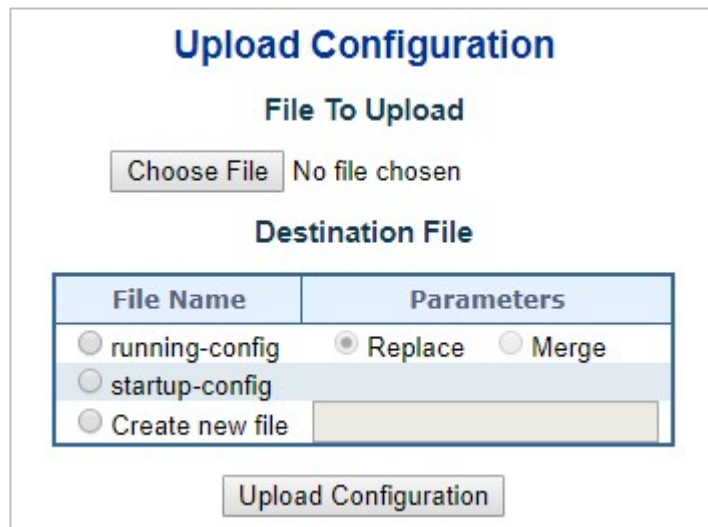

Figure 4-10-4: Configuration Upload Page Screenshot

If the destination is running-config, the file will be applied to the switch configuration. This can be done in two ways:

- Replace mode: The current configuration is fully replaced with the configuration in the uploaded file.
- Merge mode: The uploaded file is merged into *running-config*.

If the file system is full (i.e. contains the three system files mentioned above plus two other files), it is not possible to create new files, but an existing file must be overwritten or another deleted first.

4.8.1.5 Configure Activate

The Configure Activate page allows to activate the startup-config and default-config files present on the switch. Please refer to the Figure 4-10-5 shown below.

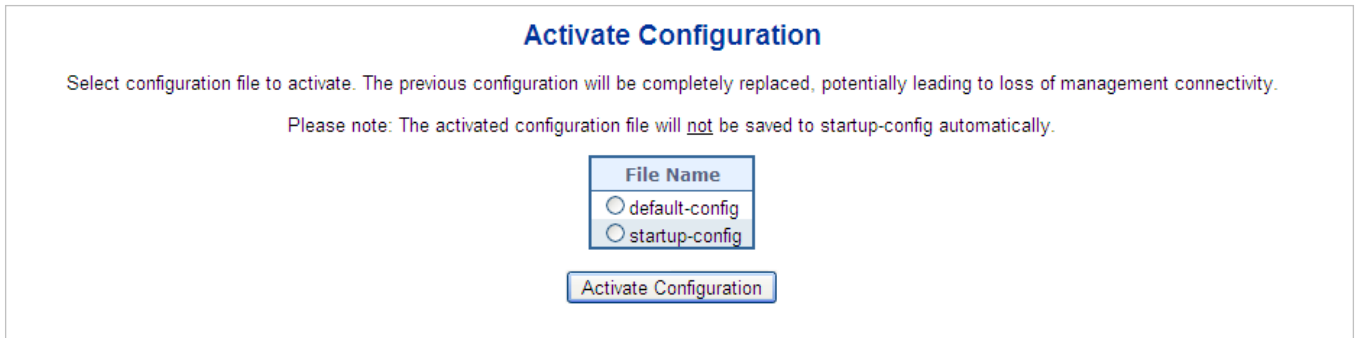

Figure 4-10-5: Configuration Activate Page Screenshot

It is possible to activate any of the configuration files present on the switch, except for *running-config* which represents the currently active configuration.

Select the file to activate and click . This will initiate the process of completely replacing the existing configuration with that of the selected file.

4.8.1.6 Configure Delete

The Configure Delete page allows to delete the startup-config and default-config files which are stored in FLASH. If this is done and the switch is rebooted without a prior Save operation, this effectively resets the switch to default configuration. Please refer to the Figure 4-10-6 shown below.

Figure 4-10-6: Configuration Delete Page Screenshot

4.8.1.7 Image Select

This page provides information about the active and alternate (backup) firmware images in the device, and allows you to revert to the alternate image. The web page displays two tables with information about the active and alternate firmware images. The Image Select screen in [Figure 4-10-7](#) appears.

In case the active firmware image is the alternate image, only the "Active Image" table is shown. In this case, the Activate Alternate Image button is also disabled.

1. If the alternate image is active (due to a corruption of the primary image or by manual intervention), uploading a new firmware image to the device will automatically use the primary image slot and activate this.
2. The firmware version and date information may be empty for older firmware releases. This does not constitute an error.

Software Image Selection

Active Image	
Image	GS-6320-8P2X_v1.2103b211101.mfi
Version	v1.2103b211101
Date	2021-11-01T13:23:02+08:00

Alternate Image	
Image	linux.bk
Version	v1.2112b220304
Date	2022-03-04T09:24:25+08:00

Figure 4-10-7: Software Image Selection Page Screenshot

The page includes the following fields:

Object	Description
• Image	The flash index name of the firmware image. The name of primary (preferred) image is image, the alternate image is named image.bk.
• Version	The version of the firmware image.
• Date	The date when the firmware was produced.

Buttons

: Click to use the alternate image. This button may be disabled depending on system state.

4.8.1.8 Factory Default

You can reset the configuration of the Managed Switch on this page. Only the IP configuration is retained. The new configuration is available immediately, which means that no restart is necessary. The Factory Default screen in [Figure 4-10-8](#) appears.

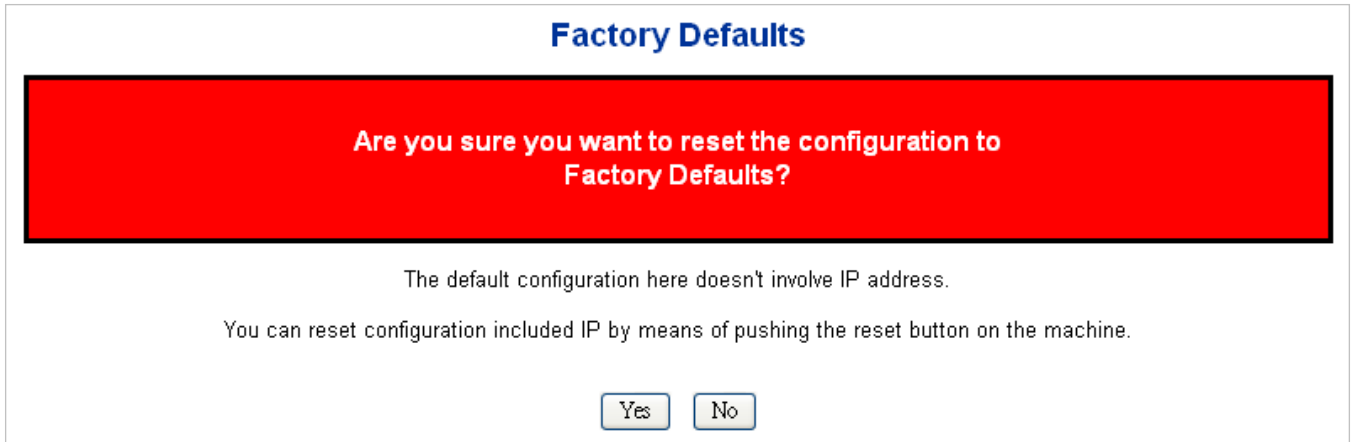

Figure 4-10-8: Factory Default Page Screenshot

Buttons

: Click to reset the configuration to Factory Defaults.

: Click to return to the Port State page without resetting the configuration.

To reset the Managed Switch to the Factory default setting, you can also press the hardware reset button at the front panel about 10 seconds. After the device is rebooted, you can login the management Web interface within the same subnet of 192.168.0.xx.

4.8.1.9 System Reboot

The **Reboot** page enables the device to be rebooted from a remote location. Once the Reboot button is pressed, user has to re-login the Web interface about 60 seconds later; the System Reboot screen in [Figure 4-10-9](#) appears.

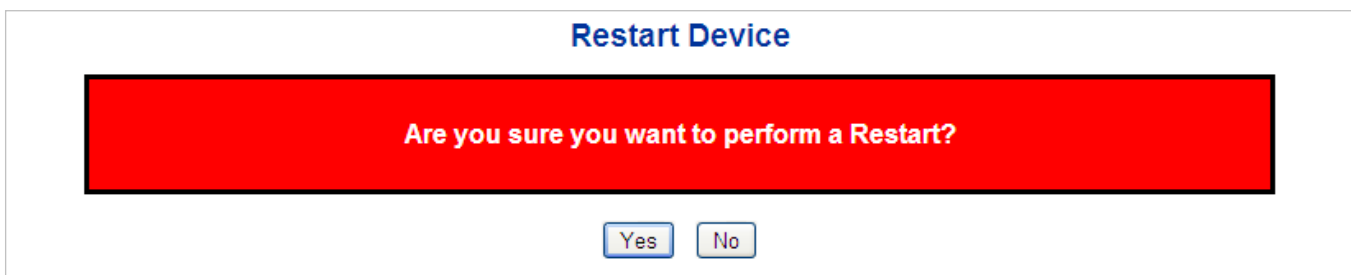

Figure 4-10-9: System Reboot Page Screenshot

Buttons

: Click to reboot the system.

: Click to return to the Port State page without rebooting the system.

You can also check the **SYS LED** on the front panel to identify whether the System is loaded completely or not. If the SYS LED is blinking, then it is in the firmware load stage; if the SYS LED light is on, you can use the Web browser to login the Managed Switch.

4.8.2 Diagnostics

4.8.2.1 Ping

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues.

After you press **"Start"**, 5 ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in [Figure 4-10-10](#) appears.

Ping (IPv4)

Fill in the parameters as needed and press "Start" to initiate the Ping session.

Hostname or IP Address	<input type="text"/>
Payload Size (bytes)	<input type="text" value="56"/>
Payload Data Pattern	<input type="text" value="0"/>
Packet Count (packets)	<input type="text" value="5"/>
TTL Value	<input type="text" value="64"/>
VID for Source Interface	<input type="text"/>
Source Port Number	<input type="text"/>
IP Address for Source Interface	<input type="text"/>
Quiet (only print result)	<input type="checkbox"/>

Figure 4-10-10: ICMP Ping Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • IP Address 	The destination IP Address.
<ul style="list-style-type: none"> • Ping Length 	The payload size of the ICMP packet. Values range from 2 bytes to 1452 bytes.

Be sure the target IP Address is within the same network subnet of the Managed Switch, or you had setup the correct gateway IP address.

Buttons

: Click to transmit ICMP packets.

: Click to re-start diagnostics with PING.

4.8.2.2 IPv6 Ping

This page allows you to issue ICMPv6 PING packets to troubleshoot IPv6 connectivity issues.

After you press “**Start**”, 5 ICMPv6 packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMPv6 Ping screen in [Figure 4-10-11](#) appears.

Figure 4-9-11: ICMPv6 Ping Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • IP Address 	The destination IP Address.
<ul style="list-style-type: none"> • Ping Length 	The payload size of the ICMP packet. Values range from 2 bytes to 1452 bytes.

Buttons

: Click to transmit ICMP packets.

: Click to re-start diagnostics with PING.

4.8.2.3 Remote IP Ping

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues on special port.

After you press “Test”, 5 ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in [Figure 4-10-12](#) appears.

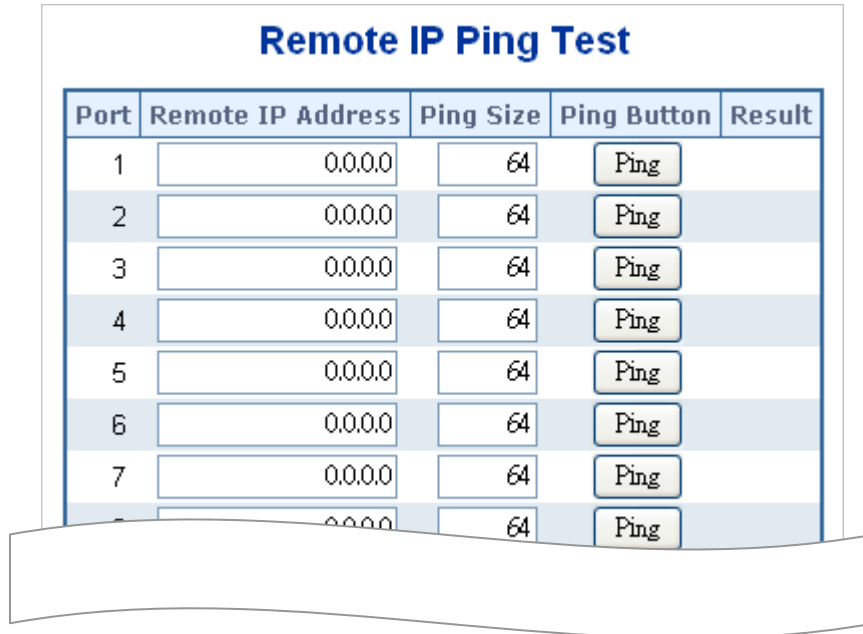

Figure 4-10-12: Remote IP Ping Test Page Screenshot

The page includes the following fields:

Object	Description
• Port	The logical port for the settings.
• Remote IP Address	The destination IP Address.
• Ping Size	The payload size of the ICMP packet. Values range from 8 bytes to 1400 bytes.
• Result	Display the ping result.

Buttons

Apply : Click to apply changes

Reset : Click to undo any changes made locally and revert to previously saved values.

Clear : Clears the IP Address and the result of ping value.

4.8.2.4 Cable Diagnostics

This page is used for running the Cable Diagnostics.

Press to run the diagnostics. This will take approximately 5 seconds. If all ports are selected, this can take approximately 15 seconds. When completed, the page refreshes automatically, and you can view the cable diagnostics results in the cable status table. Note that Cable Diagnostics is only accurate for cables of length 7 - 140 meters.

10 and 100 Mbps ports will be linked down while running cable diagnostic. Therefore, running cable diagnostic on a 10 or 100 Mbps management port will cause the switch to stop responding until VeriPHY is complete. The VeriPHY Cable Diagnostics screen in [Figure 4-10-13](#) appears.

VeriPHY Cable Diagnostics

Port

Cable Status									
Port	Description	Pair A(1,2)	Length A	Pair B(3,6)	Length B	Pair C(4,5)	Length C	Pair D(7,8)	Length D

5		--	--	--	--	--	--	--	--
6		--	--	--	--	--	--	--	--
7		--	--	--	--	--	--	--	--

Figure 4-10-13 VeriPHY Cable Diagnostics Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Port 	The port where you are requesting Cable Diagnostics.
<ul style="list-style-type: none"> • Description 	Display per port description.
<ul style="list-style-type: none"> • Cable Status 	<p>Port: Port number.</p> <p>Pair: The status of the cable pair.</p> <ul style="list-style-type: none"> OK - Correctly terminated pair Open - Open pair Short - Shorted pair Short A - Cross-pair short to pair A Short B - Cross-pair short to pair B Short C - Cross-pair short to pair C Short D - Cross-pair short to pair D Cross A - Abnormal cross-pair coupling with pair A Cross B - Abnormal cross-pair coupling with pair B Cross C - Abnormal cross-pair coupling with pair C Cross D - Abnormal cross-pair coupling with pair D <p>Length: The length (in meters) of the cable pair. The resolution is 3 meters</p>

Buttons

: Click to run the diagnostics.

5. SWITCH OPERATION

5.1 Address Table

The **Managed Switch** is implemented with an address table. This address table is composed of many entries. Each entry is used to store the address information of some nodes in the network, including MAC address, port no, etc. This information comes from the learning process of **Managed Switch**.

5.2 Learning

When one packet comes in from any port, the **Managed Switch** will record the source address, port no., and the other related information in address table. This information will be used to decide either forwarding or filtering for future packets.

5.3 Forwarding & Filtering

When one packet comes from some port of the **Managed Switch**, it will also check the destination address besides the source address learning. The **Managed Switch** will look up the address-table for the destination address. If not found, this packet will be forwarded to all the other ports except the port, which this packet comes in. And these ports will transmit this packet to the network it connected. If found, and the destination address is located at a different port from this packet comes in, the **Managed Switch** will forward this packet to the port where this destination address is located according to the information from address table. But, if the destination address is located at the same port with this packet comes in, then this packet will be filtered, thereby increasing the network throughput and availability.

5.4 Store-and-Forward

Store-and-Forward is one type of packet-forwarding techniques. A Store-and-Forward **Managed Switch** stores the incoming frame in an internal buffer and do the complete error checking before transmission. Therefore, no error packets occur; it is the best choice when a network needs efficiency and stability.

The **Managed Switch** scans the destination address from the packet-header, searches the routing table provided for the incoming port and forwards the packet, only if required. The fast forwarding makes the switch attractive for connecting servers directly to the network, thereby increasing throughput and availability. However, the switch is most commonly used to segment existence hubs, which nearly always improves the overall performance. An Ethernet switching can be easily configured in any Ethernet network environment to significantly boost bandwidth using the conventional cabling and adapters.

Due to the learning function of the **Managed Switch**, the source address and corresponding port number of each incoming and outgoing packet are stored in a routing table. This information is subsequently used to filter packets whose destination address is in the same segment as the source address. This confines network traffic to its respective domain and reduce the overall load on the network.

The **Managed Switch** performs "**Store and Fforward**"; therefore, no error packets occur. More reliably, it reduces the re-transmission rate. No packet loss will occur.

5.5 Auto-Negotiation

The STP ports on the Switch have built-in "**Auto-negotiation**". This technology automatically sets the best possible bandwidth when a connection is established with another network device (usually at Power On or Reset). This is done by detecting the modes and speeds both connected devices are capable of. Both 10BASE-T and 100BASE-TX devices can connect with the port in either half- or full-duplex mode. 1000BASE-T can be only connected in full-duplex mode.

6. TROUBLESHOOTING

This chapter contains information to help you solve issues. If the Managed Switch is not functioning properly, make sure the Managed Switch was set up according to instructions in this manual.

■ The Link LED is not lit.

Solution:

Check the cable connection and remove duplex mode of the Managed Switch.

■ Some stations cannot talk to other stations located on the other port.

Solution:

Please check the VLAN settings, trunk settings, or port enabled/disabled status.

■ Performance is bad.

Solution:

Check the full duplex status of the Managed Switch. If the Managed Switch is set to full duplex and the partner is set to half duplex, then the performance will be poor. Please also check the in/out rate of the port.

■ Why the Switch doesn't connect to the network.

Solution:

1. Check the LNK/ACT LED on the switch.
2. Try another port on the Switch.
3. Make sure the cable is installed properly.
4. Make sure the cable is the right type.
5. Turn off the power. After a while, turn on power again.

■ 1000BASE-T port link LED is lit, but the traffic is irregular.

Solution:

Check that the attached device is not set to dedicate full duplex. Some devices use a physical or software switch to change duplex modes. Auto-negotiation may not recognize this type of full-duplex setting.

■ Switch does not power up.

Solution:

1. AC power cord is not inserted or faulty.
2. Check that the AC power cord is inserted correctly.
3. Replace the power cord if the cord is inserted correctly; check that the AC power source is working by connecting a different device in place of the switch.
4. If that device works, refer to the next step.
5. If that device does not work, check the AC power.

APPENDIX A: Networking Connection

A.1 Switch's Data RJ45 Pin Assignments - 1000Mbps, 1000BASE-T

PIN NO	MDI	MDI-X
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

Implicit implementation of the crossover function within a twisted-pair cable, or at a wiring panel, while not expressly forbidden, is beyond the scope of this standard.

A.2 10/100Mbps, 10/100BASE-TX

When connecting your Switch to another Fast Ethernet switch, a bridge or a hub, a straight or crossover cable is necessary. Each port of the Switch supports auto-MDI/MDI-X detection. That means you can directly connect the Switch to any Ethernet devices without making a crossover cable. The following table and diagram show the standard RJ45 receptacle/ connector and their pin assignments:

RJ45 Connector pin assignment		
PIN NO	MDI Media Dependent Interface	MDI-X Media Dependent Interface-Cross
1	Tx + (transmit)	Rx + (receive)
2	Tx - (transmit)	Rx - (receive)
3	Rx + (receive)	Tx + (transmit)
4, 5	Not used	
6	Rx - (receive)	Tx - (transmit)
7, 8	Not used	

The standard cable, RJ45 pin assignment

The standard RJ45 receptacle/connector

There are 8 wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight-through cable and crossover cable connection:

Straight Cable		SIDE 1	SIDE 2
	<p>SIDE 1</p> <p>SIDE 2</p>	<p>1 = White / Amber 2 = Amber 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown</p>	<p>1 = White / Amber 2 = Amber 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown</p>
Crossover Cable		SIDE 1	SIDE 2
	<p>SIDE 1</p> <p>SIDE 2</p>	<p>1 = White / Amber 2 = Amber 3 = White / Green 4 = Blue 5 = White / Blue 6 = Green 7 = White / Brown 8 = Brown</p>	<p>1 = White / Green 2 = Green 3 = White / Amber 4 = Blue 5 = White / Blue 6 = Amber 7 = White / Brown 8 = Brown</p>

Figure A-1: Straight-through and Crossover Cable

Please make sure your connected cables are with the same pin assignment and color as the above picture before deploying the cables into your network.

APPENDIX B : GLOSSARY

A

ACE

ACE is an acronym for **A**ccess **C**ontrol **E**ntry. It describes access permission associated with a particular ACE ID.

There are three ACE frame types (Ethernet Type, ARP, and IPv4) and two ACE actions (permit and deny). The ACE also contains many detailed, different parameter options that are available for individual application.

ACL

ACL is an acronym for **A**ccess **C**ontrol **L**ist. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program.

Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

There are 3 web pages associated with the manual ACL configuration:

ACL|Access Control List: The web page shows the ACEs in a prioritized way, highest (top) to lowest (bottom). Default the table is empty. An ingress frame will only get a hit on one ACE even though there are more matching ACEs. The first matching ACE will take action (permit/deny) on that frame and a counter associated with that ACE is incremented. An ACE can be associated with a policy, 1 ingress port, or any ingress port (the whole switch). If an ACE Policy is created then that policy can be associated with a group of ports under the "Ports" web page. There are number of parameters that can be configured with an ACE. Read the web page help text to get further information for each of them. The maximum number of ACEs is 64.

ACL|Ports: The ACL Port configuration is used to assign a Policy ID to an ingress port. This is useful to group ports to obey the same traffic rules. Traffic Policy is created under the "Access Control List". You can you also set up specific traffic properties (Action / Rate Limiter / Port copy, etc) for each ingress port. They will though only apply if the frame gets past the ACE matching without getting matched. In that case a counter associated with that port is incremented. See the web page help text for each specific port property.

ACL|Rate Limiters: On this page, you can configure the rate limiters. There can be 15 different rate limiters, each ranging from 1 to 1024K packets per second. Under "Ports" and "Access Control List", you can assign a Rate Limiter ID to the ACE(s) or ingress port(s).

AES

AES is an acronym for **A**dvanced **E**ncryption **S**tandard. The encryption key protocol is applied in 802.1x standard to improve WLAN security. It is an encryption standard by the U.S. government, which will replace DES and 3DES. AES has a fixed block size of 128 bits and a key size of 128, 192, or 256 bits.

AMS

AMS is an acronym for **A**uto **M**edia **S**elect. AMS is used for dual media ports (ports supporting both copper (cu) and fiber (SFP) cables. AMS automatically determines if an SFP or a CU cable is inserted and switches to the corresponding media. If both SFP and cu cables are inserted, the port will select the preferred media.

APS

APS is an acronym for **A**utomatic **P**rotection **S**witching. This protocol is used to secure switching that is done bidirectional in both ends of a protection group, as defined in G.8031.

Aggregation

Using multiple ports in parallel to increase the link speed beyond the limits of a port and to increase the redundancy for higher availability.

(Also Port Aggregation, Link Aggregation).

ARP

ARP is an acronym for **A**ddress **R**esolution **P**rotocol. It is a protocol that used to convert an IP address into a physical address, such as an Ethernet address. ARP allows a host to communicate with other hosts when only the Internet address of its neighbors is known. Before using IP, the host sends a broadcast ARP request containing the Internet address of the desired destination system.

ARP Inspection

ARP Inspection is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through the switch device.

Auto-Negotiation

Auto-negotiation is the process where two different devices establish the mode of operation and the speed settings that can be shared by those devices for a link.

C

CC

CC is an acronym for Continuity Check. It is a MEP functionality that is able to detect loss of continuity in a network by transmitting CCM frames to a peer MEP.

CCM

CCM is an acronym for Continuity Check Message. It is a OAM frame transmitted from a MEP to its peer MEP and used to implement CC functionality.

CDP

CDP is an acronym for Cisco Discovery Protocol.

D

DEI

DEI is an acronym for Drop Eligible Indicator. It is a 1-bit field in the VLAN tag.

DES

DES is an acronym for Data Encryption Standard. It provides a complete description of a mathematical algorithm for encrypting (enciphering) and decrypting (deciphering) binary coded information.

Encrypting data converts it to an unintelligible form called cipher. Decrypting cipher converts the data back to its original form called plaintext. The algorithm described in this standard specifies both enciphering and deciphering operations which are based on a binary number called a key.

DHCP

DHCP is an acronym for Dynamic Host Configuration Protocol. It is a protocol used for assigning dynamic IP addresses to devices on a network.

DHCP used by networked computers (clients) to obtain IP addresses and other parameters such as the default gateway, subnet mask, and IP addresses of DNS servers from a DHCP server.

The DHCP server ensures that all IP addresses are unique, for example, no IP address is assigned to a second client while the first client's assignment is valid (its lease has not expired). Therefore, IP address pool management is done by the server and not by a human network administrator.

Dynamic addressing simplifies network administration because the software keeps track of IP addresses rather than requiring an administrator to manage the task. This means that a new computer can be added to a network without the

hassle of manually assigning it a unique IP address.

DHCP Relay

DHCP Relay is used to forward and to transfer DHCP messages between the clients and the server when they are not on the same subnet domain.

The DHCP option 82 enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options: Circuit ID (option 1) and Remote ID (option2). The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on. The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes represent the VLAN ID. The parameter of "module_id" is the third byte for the module ID. The parameter of "port_no" is the fourth byte and it means the port number.

The Remote ID is 6 bytes in length, and the value is equal the DHCP relay agents MAC address.

DHCP Snooping

DHCP Snooping is used to block intruder on the untrusted ports of the switch device when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server.

DNS

DNS is an acronym for **D**omain **N**ame **S**ystem. It stores and associates many types of information with domain names. Most importantly, DNS translates human-friendly domain names and computer hostnames into computer-friendly IP addresses. For example, the domain name www.example.com might translate to 192.168.0.1.

DoS

DoS is an acronym for **D**enial of **S**ervice. In a denial-of-service (DoS) attack, an attacker attempts to prevent legitimate users from accessing information or services. By targeting at network sites or network connection, an attacker may be able to prevent network users from accessing email, web sites, online accounts (banking, etc.), or other services that rely on the affected computer.

Dotted Decimal Notation

Dotted Decimal Notation refers to a method of writing IP addresses using decimal numbers and dots as separators between octets.

An IPv4 dotted decimal address has the form x.y.z.w, where x, y, z, and w are decimal numbers between 0 and 255.

DSCP

DSCP is an acronym for **D**ifferentiated **S**ervices **C**ode **P**oint. It is a field in the header of IP packets for packet classification purposes.

E

EEE

EEE is an abbreviation for Energy Efficient Ethernet defined in IEEE 802.3az.

EPS

EPS is an abbreviation for Ethernet Protection Switching defined in ITU/T G.8031.

Ethernet Type

Ethernet Type, or EtherType, is a field in the Ethernet MAC header, defined by the Ethernet networking standard. It is used to indicate which protocol is being transported in an Ethernet frame.

F

FTP

FTP is an acronym for **F**ile **T**ransfer **P**rotocol. It is a transfer protocol that uses the Transmission Control Protocol (TCP) and provides file writing and reading. It also provides directory service and security features.

Fast Leave

IGMP snooping Fast Leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out group specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original leave message. Fast-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are in use simultaneously.

H

HTTP

HTTP is an acronym for **H**ypertext **T**ransfer **P**rotocol. It is a protocol that used to transfer or convey information on the World Wide Web (WWW).

HTTP defines how messages are formatted and transmitted, and what actions Web servers and browsers should take in response to various commands. For example, when you enter a URL in your browser, this actually sends an HTTP command to the Web server directing it to fetch and transmit the requested web page. The other main standard that controls how the World Wide Web works is HTML, which covers how web pages are formatted and displayed.

Any Web server machine contains, in addition to the web page files it can serve, an HTTP daemon, a program that is designed to wait for HTTP requests and handle them when they arrive. The Web browser is an HTTP client, sending requests to server machines. An HTTP client initiates a request by establishing a Transmission Control Protocol (TCP) connection to a particular port on a remote host (port 80 by default). An HTTP server listening on that port waits for the client to send a request message.

HTTPS

HTTPS is an acronym for **H**ypertext **T**ransfer **P**rotocol over **S**ecure Socket Layer. It is used to indicate a secure HTTP connection.

HTTPS provide authentication and encrypted communication and is widely used on the World Wide Web for security-sensitive communication such as payment transactions and corporate logons.

HTTPS is really just the use of Netscape's Secure Socket Layer (SSL) as a sublayer under its regular HTTP application layering. (HTTPS uses port 443 instead of HTTP port 80 in its interactions with the lower layer, TCP/IP.) SSL uses a 40-bit key size for the RC4 stream encryption algorithm, which is considered an adequate degree of encryption for commercial exchange.

I

ICMP

ICMP is an acronym for **I**nternet **C**ontrol **M**essage **P**rotocol. It is a protocol that generated the error response, diagnostic or routing purposes. ICMP messages generally contain information about routing difficulties or simple exchanges such as time-stamp or echo transactions. For example, the PING command uses ICMP to test an Internet connection.

IEEE 802.1X

IEEE 802.1X is an IEEE standard for port-based Network Access Control. It provides authentication to devices attached to a LAN port, establishing a point-to-point connection or preventing access from that port if authentication fails. With 802.1X, access to all switch ports can be centrally controlled from a server, which means that authorized users can use the same credentials for authentication from any point within the network.

IGMP

IGMP is an acronym for **I**nternet **G**roup **M**anagement **P**rotocol. It is a communications protocol used to manage the membership of Internet Protocol multicast groups. IGMP is used by IP hosts and adjacent multicast routers to establish multicast group memberships. It is an integral part of the IP multicast specification, like ICMP for unicast connections. IGMP can be used for online video and gaming, and allows more efficient use of resources when supporting these uses.

IGMP Querier

A router sends IGMP Query messages onto a particular link. This router is called the Querier.

IMAP

IMAP is an acronym for **I**nternet **M**essage **A**ccess **P**rotocol. It is a protocol for email clients to retrieve email messages from a mail server.

IMAP is the protocol that IMAP clients use to communicate with the servers, and SMTP is the protocol used to transport mail to an IMAP server.

The current version of the Internet Message Access Protocol is IMAP4. It is similar to Post Office Protocol version 3 (POP3), but offers additional and more complex features. For example, the IMAP4 protocol leaves your email messages on the server rather than downloading them to your computer. If you wish to remove your messages from the server, you must use your mail client to generate local folders, copy messages to your local hard drive, and then delete and expunge the messages from the server.

IP

IP is an acronym for **I**nternet **P**rotocol. It is a protocol used for communicating data across a internet network.

IP is a "best effort" system, which means that no packet of information sent over it is assured to reach its destination in the same condition it was sent. Each device connected to a Local Area Network (LAN) or Wide Area Network (WAN) is given an Internet Protocol address, and this IP address is used to identify the device uniquely among all other devices connected to the extended network.

The current version of the Internet protocol is IPv4, which has 32-bits Internet Protocol addresses allowing for in excess of four billion unique addresses. This number is reduced drastically by the practice of webmasters taking addresses in large blocks, the bulk of which remain unused. There is a rather substantial movement to adopt a new version of the Internet Protocol, IPv6, which would have 128-bits Internet Protocol addresses. This number can be represented roughly by a three with thirty-nine zeroes after it. However, IPv4 is still the protocol of choice for most of the Internet.

IPMC

IPMC is an acronym for **IP** **M**ulti**C**ast.

IP Source Guard

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

L

LACP

LACP is an IEEE 802.3ad standard protocol. The Link Aggregation Control Protocol allows bundling several physical ports together to form a single logical port.

LLDP

LLDP is an IEEE 802.1ab standard protocol.

The Link Layer Discovery Protocol(LLDP) specified in this standard allows stations attached to an IEEE 802 LAN to advertise, to other stations attached to the same IEEE 802 LAN, the major capabilities provided by the system incorporating that station, the management address or addresses of the entity or entities that provide management of those capabilities, and the identification of the stations point of attachment to the IEEE 802 LAN required by those management entities. The information distributed via this protocol is stored by its recipients in a standard Management Information Base (MIB), making it possible for the information to be accessed by a Network Management System (NMS) using a management protocol such as the Simple Network Management Protocol (SNMP).

LLDP-MED

LLDP-MED is an extension of IEEE 802.1ab and is defined by the telecommunication industry association (TIA-1057).

LOC

LOC is an acronym for Loss Of Connectivity and is detected by a MEP and is indicating lost connectivity in the network. Can be used as a switch criteria by EPS

M

MAC Table

Switching of frames is based upon the DMAC address contained in the frame. The switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address have been seen after a configurable age time.

MEP

MEP is an acronym for Maintenance Entity Endpoint and is an endpoint in a Maintenance Entity Group (ITU-T Y.1731).

MD5

MD5 is an acronym for **M**essage-**D**igest algorithm **5**. MD5 is a message digest algorithm, used cryptographic hash function with a 128-bit hash value. It was designed by Ron Rivest in 1991. MD5 is officially defined in RFC 1321 - The MD5 Message-Digest Algorithm.

Mirroring

For debugging network problems or monitoring network traffic, the switch system can be configured to mirror frames from multiple ports to a mirror port. (In this context, mirroring a frame is the same as copying the frame.)

Both incoming (source) and outgoing (destination) frames can be mirrored to the mirror port.

MLD

MLD is an acronym for **M**ulticast **L**istener **D**iscovery for IPv6. MLD is used by IPv6 routers to discover multicast listeners on a directly attached link, much as IGMP is used in IPv4. The protocol is embedded in ICMPv6 instead of using a separate protocol.

MVR

Multicast VLAN Registration (MVR) is a protocol for Layer 2 (IP)-networks that enables multicast-traffic from a source VLAN to be shared with subscriber-VLANs. The main reason for using MVR is to save bandwidth by preventing duplicate multicast streams being sent in the core network, instead the stream(s) are received on the MVR-VLAN and forwarded to the VLANs where hosts have requested it/them (Wikipedia).

N

NAS

NAS is an acronym for Network Access Server. The NAS is meant to act as a gateway to guard access to a protected source. A client connects to the NAS, and the NAS connects to another resource asking whether the client's supplied credentials are valid. Based on the answer, the NAS then allows or disallows access to the protected resource. An example of a NAS implementation is IEEE 802.1X.

NetBIOS

NetBIOS is an acronym for **N**etwork **B**asic **I**nput/**O**utput **S**ystem. It is a program that allows applications on separate computers to communicate within a Local Area Network (LAN), and it is not supported on a Wide Area Network (WAN).

The NetBIOS giving each computer in the network both a NetBIOS name and an IP address corresponding to a different host name, provides the session and transport services described in the Open Systems Interconnection (OSI) model.

NFS

NFS is an acronym for **N**etwork **F**ile **S**ystem. It allows hosts to mount partitions on a remote system and use them as though they are local file systems.

NFS allows the system administrator to store resources in a central location on the network, providing authorized users continuous access to them, which means NFS supports sharing of files, printers, and other resources as persistent storage over a computer network.

NTP

NTP is an acronym for **N**etwork **T**ime **P**rotocol, a network protocol for synchronizing the clocks of computer systems. NTP uses UDP (datagrams) as transport layer.

O

OAM

OAM is an acronym for **O**peration **A**dministration and **M**aintenance. It is a protocol described in ITU-T Y.1731 used to implement carrier Ethernet functionality. MEP functionality like CC and RDI is based on this.

Optional TLVs.

An LLDP frame contains multiple TLVs. For some TLVs it is configurable if the switch includes the TLV in the LLDP frame. These TLVs are known as optional TLVs. If an optional TLV is disabled the corresponding information is not included in the LLDP frame.

OUI

OUI is the organizationally unique identifier. An OUI address is a globally unique identifier assigned to a vendor by IEEE. You can determine which vendor a device belongs to according to the OUI address which forms the first 24 bits of an MAC address.

P

PCP

PCP is an acronym for Priority Code Point. It is a 3-bit field storing the priority level for the 802.1Q frame. It is also known as User Priority.

PD

PD is an acronym for **P**owered **D**evice. In a PoE system the power is delivered from a PSE (power sourcing equipment) to a remote device. The remote device is called a PD.

PHY

PHY is an abbreviation for Physical Interface Transceiver and is the device that implement the Ethernet physical layer (IEEE-802.3).

PING

Ping is a program that sends a series of packets over a network or the Internet to a specific computer in order to generate a response from that computer. The other computer responds with an acknowledgment that it received the packets. Ping was created to verify whether a specific computer on a network or the Internet exists and is connected.

Ping uses Internet Control Message Protocol (ICMP) packets. The Ping Request is the packet from the origin computer, and the Ping Reply is the packet response from the target.

Policer

A policer can limit the bandwidth of received frames. It is located in front of the ingress queue.

POP3

POP3 is an acronym for **P**ost **O**ffice **P**rotocol version 3. It is a protocol for email clients to retrieve email messages from a mail server.

POP3 is designed to delete mail on the server as soon as the user has downloaded it. However, some implementations allow users or an administrator to specify that mail be saved for some period of time. POP can be thought of as a "store-and-forward" service.

An alternative protocol is Internet Message Access Protocol (IMAP). IMAP provides the user with more capabilities for retaining e-mail on the server and for organizing it in folders on the server. IMAP can be thought of as a remote file server.

POP and IMAP deal with the receiving of e-mail and are not to be confused with the Simple Mail Transfer Protocol (SMTP). You send e-mail with SMTP, and a mail handler receives it on your recipient's behalf. Then the mail is read using POP or IMAP. IMAP4 and POP3 are the two most prevalent Internet standard protocols for e-mail retrieval. Virtually all modern e-mail clients and servers support both.

PPPoE

PPPoE is an acronym for Point-to-Point Protocol over Ethernet. It is a network protocol for encapsulating Point-to-Point Protocol (PPP) frames inside Ethernet frames. It is used mainly with ADSL services where individual users connect to the ADSL transceiver (modem) over Ethernet and in plain Metro Ethernet networks (Wikipedia).

Private VLAN

In a private VLAN, communication between ports in that private VLAN is not permitted. A VLAN can be configured as a private VLAN.

PTP

PTP is an acronym for Precision Time Protocol, a network protocol for synchronizing the clocks of computer systems.

Q

QCE

QCE is an acronym for **Q**oS **C**ontrol **E**ntry. It describes QoS class associated with a particular QCE ID.

There are six QCE frame types: Ethernet Type, VLAN, UDP/TCP Port, DSCP, TOS, and Tag Priority. Frames can be classified by one of 4 different QoS classes: "Low", "Normal", "Medium", and "High" for individual application.

QCL

QCL is an acronym for **Q**oS **C**ontrol **L**ist. It is the list table of QCEs, containing QoS control entries that classify to a specific QoS class on specific traffic objects.

Each accessible traffic object contains an identifier to its QCL. The privileges determine specific traffic object to specific QoS class.

QL

QL In SyncE this is the Quality Level of a given clock source. This is received on a port in a SSM indicating the quality of the clock received in the port.

QoS

QoS is an acronym for **Q**uality **o**f **S**ervice. It is a method to guarantee a bandwidth relationship between individual applications or protocols.

A communications network transports a multitude of applications and data, including high-quality video and delay-sensitive data such as real-time voice. Networks must provide secure, predictable, measurable, and sometimes guaranteed services.

Achieving the required QoS becomes the secret to a successful end-to-end business solution. Therefore, QoS is the set of techniques to manage network resources.

QoS class

Every incoming frame is classified to a QoS class, which is used throughout the device for providing queuing, scheduling and congestion control guarantees to the frame according to what was configured for that specific QoS class. There is a one to one mapping between QoS class, queue and priority. A QoS class of 0 (zero) has the lowest priority.

R

RARP

RARP is an acronym for **R**everse **A**ddress **R**esolution **P**rotocol. It is a protocol that is used to obtain an IP address for a given hardware address, such as an Ethernet address. RARP is the complement of ARP.

RADIUS

RADIUS is an acronym for **R**emote **A**uthentication **D**ial In **U**ser **S**ervice. It is a networking protocol that provides centralized access, authorization and accounting management for people or computers to connect and use a network service.

RDI

RDI is an acronym for **R**emote **D**efect **I**ndication. It is an OAM functionality that is used by a MEP to indicate defect detected to the remote peer MEP

Router Port

A router port is a port on the Ethernet switch that leads switch towards the Layer 3 multicast device.

RSTP

In 1998, the IEEE with document 802.1w introduced an evolution of STP: the **R**apid **S**panning **T**ree **P**rotocol, which provides for faster spanning tree convergence after a topology change. Standard IEEE 802.1D-2004 now incorporates RSTP and obsoletes STP, while at the same time being backwards-compatible with STP.

S

SAMBA

Samba is a program running under UNIX-like operating systems that provides seamless integration between UNIX and Microsoft Windows machines. Samba acts as file and print servers for Microsoft Windows, IBM OS/2, and other SMB client machines. Samba uses the Server Message Block (SMB) protocol and Common Internet File System (CIFS), which is the underlying protocol used in Microsoft Windows networking.

Samba can be installed on a variety of operating system platforms, including Linux, most common Unix platforms, OpenVMS, and IBM OS/2.

Samba can also register itself with the master browser on the network so that it would appear in the listing of hosts in Microsoft Windows "Neighborhood Network".

SHA

SHA is an acronym for **S**ecure **H**ash **A**lgorithm. It designed by the National Security Agency (NSA) and published by the NIST as a U.S. Federal Information Processing Standard. Hash algorithms compute a fixed-length digital representation (known as a message digest) of an input data sequence (the message) of any length.

Shaper

A shaper can limit the bandwidth of transmitted frames. It is located after the ingress queues.

SMTP

SMTP is an acronym for **S**imple **M**ail **T**ransfer **P**rotocol. It is a text-based protocol that uses the Transmission Control Protocol (TCP) and provides a mail service modeled on the FTP file transfer service. SMTP transfers mail messages between systems and notifications regarding incoming mail.

SNAP

The SubNetwork Access Protocol (SNAP) is a mechanism for multiplexing, on networks using IEEE 802.2 LLC, more protocols than can be distinguished by the 8-bit 802.2 Service Access Point (SAP) fields. SNAP supports identifying protocols by Ethernet type field values; it also supports vendor-private protocol identifier.

SNMP

SNMP is an acronym for **S**imple **N**etwork **M**anagement **P**rotocol. It is part of the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol for network management. SNMP allow diverse network objects to participate in a network management architecture. It enables network management systems to learn network problems by receiving traps or change notices from network devices implementing SNMP.

SNTP

SNTP is an acronym for **S**imple **N**etwork **T**ime **P**rotocol, a network protocol for synchronizing the clocks of computer systems. SNTP uses UDP (datagrams) as transport layer.

SPROUT

Stack **P**rotocol using **R**outing **T**echnology. An advanced protocol for almost instantaneous discovery of topology changes within a stack as well as election of a master switch. SPROUT also calculates parameters for setting up each switch to perform shortest path forwarding within the stack.

SSID

Service **S**et **I**dentifier is a name used to identify the particular 802.11 wireless LANs to which a user wants to attach. A client device will receive broadcast messages from all access points within range advertising their SSIDs, and can choose one to connect to based on pre-configuration, or by displaying a list of SSIDs in range and asking the user to select one (wikipedia).

SSH

SSH is an acronym for **S**ecure **S**Hell. It is a network protocol that allows data to be exchanged using a secure channel between two networked devices. The encryption used by SSH provides confidentiality and integrity of data over an insecure network. The goal of SSH was to replace the earlier rlogin, TELNET and rsh protocols, which did not provide strong authentication or guarantee confidentiality (Wikipedia).

SSM

SSM In SyncE this is an abbreviation for Synchronization Status Message and is containing a QL indication.

STP

Spanning **T**ree **P**rotocol is an OSI layer-2 protocol which ensures a loop free topology for any bridged LAN. The original STP protocol is now obsolete by RSTP.

SyncE

SyncE is an abbreviation for Synchronous Ethernet. This functionality is used to make a network 'clock frequency' synchronized. Not to be confused with real time clock synchronized (IEEE 1588).

T

TACACS+

TACACS+ is an acronym for **T**erminal **A**ccess **C**ontroller **A**ccess **C**ontrol **S**ystem **P**lus. It is a networking protocol which provides access control for routers, network access servers and other networked computing devices via one or more centralized servers. TACACS+ provides separate authentication, authorization and accounting services.

Tag Priority

Tag Priority is a 3-bit field storing the priority level for the 802.1Q frame.

TCP

TCP is an acronym for **T**ransmission **C**ontrol **P**rotocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

The TCP protocol guarantees reliable and in-order delivery of data from sender to receiver and distinguishes data for multiple connections by concurrent applications (for example, Web server and e-mail server) running on the same host.

The applications on networked hosts can use TCP to create connections to one another. It is known as a connection-oriented protocol, which means that a connection is established and maintained until such time as the message or messages to be exchanged by the application programs at each end have been exchanged. TCP is responsible for ensuring that a message is divided into the packets that IP manages and for reassembling the packets back into the complete message at the other end.

Common network applications that use TCP include the World Wide Web (WWW), e-mail, and File Transfer Protocol (FTP).

TELNET

TELNET is an acronym for **T**ele~~type~~ **N**etwork. It is a terminal emulation protocol that uses the Transmission Control Protocol (TCP) and provides a virtual connection between TELNET server and TELNET client.

TELNET enables the client to control the server and communicate with other servers on the network. To start a Telnet session, the client user must log in to a server by entering a valid username and password. Then, the client user can enter commands through the Telnet program just as if they were entering commands directly on the server console.

TFTP

TFTP is an acronym for **T**ivial **F**ile **T**ransfer **P**rotocol. It is transfer protocol that uses the User Datagram Protocol (UDP) and provides file writing and reading, but it does not provides directory service and security features.

Toss

Toss is an acronym for **T**ype **o**f **S**ervice. It is implemented as the IPv4 Toss priority control. It is fully decoded to determine the priority from the 6-bit Toss field in the IP header. The most significant 6 bits of the Toss field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bit in the IPv4 ToS priority control bit (0~63).

TLV

TLV is an acronym for **T**ype **L**ength **V**alue. A LLDP frame can contain multiple pieces of information. Each of these pieces of information is known as TLV.

TKIP

TKIP is an acronym for **T**emporal **K**ey **I**ntegrity **P**rotocol. It used in WPA to replace WEP with a new encryption algorithm. TKIP comprises the same encryption engine and RC4 algorithm defined for WEP. The key used for encryption in TKIP is 128 bits and changes the key used for each packet.

U**UDP**

UDP is an acronym for **U**ser **D**atagram **P**rotocol. It is a communications protocol that uses the Internet Protocol (IP) to exchange the messages between computers.

UDP is an alternative to the Transmission Control Protocol (TCP) that uses the Internet Protocol (IP). Unlike TCP, UDP does not provide the service of dividing a message into packet datagrams, and UDP doesn't provide reassembling and sequencing of the packets. This means that the application program that uses UDP must be able to make sure that the entire message has arrived and is in the right order. Network applications that want to save processing time because they have very small data units to exchange may prefer UDP to TCP.

UDP provides two services not provided by the IP layer. It provides port numbers to help distinguish different user requests and, optionally, a checksum capability to verify that the data arrived intact.

Common network applications that use UDP include the Domain Name System (DNS), streaming media applications such as IPTV, Voice over IP (VoIP), and Trivial File Transfer Protocol (TFTP).

UPnP

UPnP is an acronym for **U**niversal **P**lug and **P**lay. The goals of UPnP are to allow devices to connect seamlessly and to simplify the implementation of networks in the home (data sharing, communications, and entertainment) and in corporate environments for simplified installation of computer components

User Priority

User Priority is a 3-bit field storing the priority level for the 802.1Q frame.

V

VLAN

A method to restrict communication between switch ports. VLANs can be used for the following applications:

VLAN unaware switching: This is the default configuration. All ports are VLAN unaware with Port VLAN ID 1 and members of VLAN 1. This means that MAC addresses are learned in VLAN 1, and the switch does not remove or insert VLAN tags.

VLAN aware switching: This is based on the IEEE 802.1Q standard. All ports are VLAN aware. Ports connected to VLAN aware switches are members of multiple VLANs and transmit tagged frames. Other ports are members of one VLAN, set up with this Port VLAN ID, and transmit untagged frames.

Provider switching: This is also known as Q-in-Q switching. Ports connected to subscribers are VLAN unaware, members of one VLAN, and set up with this unique Port VLAN ID. Ports connected to the service provider are VLAN aware, members of multiple VLANs, and set up to tag all frames. Untagged frames received on a subscriber port are forwarded to the provider port with a single VLAN tag. Tagged frames received on a subscriber port are forwarded to the provider port with a double VLAN tag.

VLAN ID

VLAN ID is a 12-bit field specifying the VLAN to which the frame belongs.

Voice VLAN

Voice VLAN is VLAN configured specially for voice traffic. By adding the ports with voice devices attached to voice VLAN, we can perform QoS-related configuration for voice data, ensuring the transmission priority of voice traffic and voice quality.

W

WEP

WEP is an acronym for **W**ired **E**quivalent **P**rivacy. WEP is a deprecated algorithm to secure IEEE 802.11 wireless networks. Wireless networks broadcast messages using radio, so are more susceptible to eavesdropping than wired networks. When introduced in 1999, WEP was intended to provide confidentiality comparable to that of a traditional wired network (Wikipedia).

Wi-Fi

Wi-Fi is an acronym for **W**ireless **F**idelity. It is meant to be used generically when referring of any type of 802.11 network, whether 802.11b, 802.11a, dual-band, etc. The term is promulgated by the Wi-Fi Alliance.

WPA

WPA is an acronym for **W**i-Fi **P**rotected **A**ccess. It was created in response to several serious weaknesses researchers had found in the previous system, Wired Equivalent Privacy (WEP). WPA implements the majority of the IEEE 802.11i standard, and was intended as an intermediate measure to take the place of WEP while 802.11i was prepared. WPA is specifically designed to also work with pre-WPA wireless network interface cards (through firmware upgrades), but not necessarily with first generation wireless access points. WPA2 implements the full standard, but will not work with some older network cards (Wikipedia).

WPA-PSK

WPA-PSK is an acronym for **W**i-Fi **P**rotected **A**ccess - **P**re **S**hared **K**ey. WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which distributes different keys to each user. Personal WPA utilizes less scalable 'pre-shared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia)

WPA-Radius

WPA-Radius is an acronym for **W**i-Fi **P**rotected **A**ccess - Radius (802.1X authentication server). WPA was designed to enhance the security of wireless networks. There are two flavors of WPA: enterprise and personal. Enterprise is meant for use with an IEEE 802.1X authentication server, which distributes different keys to each user. Personal WPA utilizes less scalable 'pre-shared key' (PSK) mode, where every allowed computer is given the same passphrase. In PSK mode, security depends on the strength and secrecy of the passphrase. The design of WPA is based on a Draft 3 of the IEEE 802.11i standard (Wikipedia)

WPS

WPS is an acronym for **W**i-Fi **P**rotected **S**etup. It is a standard for easy and secure establishment of a wireless home network. The goal of the WPS protocol is to simplify the process of connecting any home device to the wireless network (Wikipedia).

WRED

WRED is an acronym for **W**eighted **R**andom **E**arly **D**etection. It is an active queue management mechanism that provides preferential treatment of higher priority frames when traffic builds up within a queue. A frame's DP level is used as input to WRED. A higher DP level assigned to a frame results in a higher probability that the frame is dropped during times of congestion.

WTR

WTR is an acronym for **W**ait **T**o **R**estore. This is the time a fail on a resource has to be 'not active' before restoration back to this (previously failing) resource is done.
