If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Compliance Statement

This equipment generates and uses radio frequency energy and if not installed and used properly, that is, in strict accordance with the instructions provided with the equipment, may cause interference to radio and TV communication. The equipment has been tested and found to comply with the limits for a Class A computing device in accordance with the specifications in Subpart B of Part 15 of FCC rules, which are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation. If you suspect this equipment is causing interference, turn your Ethernet Switch on and off while your radio or TV is showing interference, if the interference disappears when you turn your Ethernet Switch off and reappears when you turn it back on, there is interference being caused by the Ethernet Switch. You can try to correct the interference by one or more of the following measures:

- 1. Reorient the receiving radio or TV antenna where this may be done safely.
- 2. To the extent possible, relocate the radio, TV or other receiver away from the Switch.
- 3. Plug the Ethernet Switch into a different power outlet so that the Switch and the receiver are on different branch circuits.

If necessary, you should consult the place of purchase or an experienced radio/television technician for additional suggestions.

Energy Saving Note of the Device

This power required device does not support Stand by mode operation.

For energy saving, please remove the DC-plug to disconnect the device from the power circuit. Without remove the DC-plug, the device will still consuming power from the power circuit. In the view of Saving the Energy and reduce the unnecessary power consuming, it is strongly suggested to switch off or remove the DC-plug for the device if this device is not intended to be active.

CE mark Warning

The is a class A device, In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

WEEE

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

Trademarks

The PLANET logo is a trademark of PLANET Technology. This documentation may refer to numerous hardware and software products by their trade names. In most, if not all cases, these designations are claimed as trademarks or registered trademarks by their respective companies.

Chapter 1 Introduction

With the growth of the Internet activities, high-speed Internet access, on-line gaming and Triple-Play Internet application are often can be seen in our daliy life. To respond this trends of Internet activities, the PLANET XRT-401F Broadband Router is an ideal solution to provide the high speed Internet access, easy-to-use, and worry-free for surfing on the internet.

With easy integration and full compatibility of existing network infrastructures, the PLANET XRT-401F comprises a 4-Port 10/100Mbps switch to allow the users quickly and easily transmiting the data through the single high-speed Internet connection.

The XRT-401F provides QoS and IGMP features to make the network services smooth. Traffic priority can be assigned by the router to guarantee some important and specific transmissions, especially for real-time streaming multimedia applications such as the on-line gaming, VoIP, and IPTV to keep the bandwidth usage smoothly.

Via the user-friendly management interface, users can setup and configure the router very easily, just follow the wizard to guide you the setup procedure step by step. Furthermore, the Router not only provides basic router functions such as DHCP server, Virtual Server, DMZ, and UPnP, but also provides full security functions including Firewall and NAT / NAPT (Network Address/Port Translation) features, to protect your network from internet intruders and attacks.

1.1 Features

Internet Access Features

- Shared Internet Access: All users on the LAN can access the Internet through the XRT-401F using only a single external IP Address. The local (invalid) IP Addresses are hidden from external sources. This process is called NAT (Network Address Translation).
- Multiple WAN Connection: On the Internet (WAN port) connection, the XRT-401F supports Dynamic IP Address (IP Address is allocated on connection), Fixed IP Address, PPPoE, PPTP and L2TP.
- **Bridge and Router Application:** The XRT-401F supports two application modes. Currently, it comes pre-configured with Router mode. Note that, Router mode and Bridge mode cannot be used simultaneously.

Advanced Internet Functions

- Quick Setup: Built-In configuration wizard helps users to complete network installation in a very short time via standard Internet browsers such as Microsoft Internet Explorer, Netscape Communicator...etc.
- QoS: Quality of service can classify the network packet based on the port base and DSCP; it can provide the best effect for real-time streaming multimedia applications such as the on-line gaming, VoIP, and IPTV.
- Virtual Servers: This feature allows Internet users to access Internet servers on your LAN. The required setup is quick and easy.

- Universal Plug and Play (UPnP): UPnP allows automatic discovery and configuration of the Broadband Router. UPnP is supported by Windows ME, XP, or later.
- **User Friendly Interface:** The XRT-401F can be managed and controlled through Web UI.
- DMZ Support: The XRT-401F can translate public IP addresses to private IP address to allow unlimited 2-Way communication with the servers or individual users on the Internet. It provides the most flexibility to run programs smoothly for programs that might be restricted in NAT environment.
- Client / URL / MAC Filtering: The Filtering function can block the unallowable LAN users accessing to Internet. Or you can use the keyword based URL Filter to block access to undesirable Web sites by LAN users.
- *RIP1/2 Routing:* It supports RIPv1/2 routing protocol for routing capability.
- VPN Pass through Support: PCs with VPN (Virtual Private Networking) software are transparently supported - no configuration is required.

LAN Features

- ◆ 4-Port Switch: The XRT-401F incorporates a 4-port 10/100Base-TX switching hub, making it easy to create or extend your LAN.
- DHCP Server Support: Dynamic Host Configuration Protocol provides a dynamic IP address to PCs and other devices upon request. The XRT-401F can act as a DHCP Server for devices on your local LAN.

1.2 Minimum Requirements

- One External xDSL (ADSL) or Cable modem with an Ethernet port (RJ-45)
- Network Interface Card (NIC) for each Personal Computer (PC)
- PCs with a Web-Browser (Internet Explorer 7.0 or higher, or Firefox 3.6 or higher)

1.4 Getting Started

Ø

This is a step-by-step instruction on how to start using the router and get connected to the Internet.

1) Setup your network as shown in the setup diagram below.

2) Then, you need to setup your LAN PC clients so that it can obtain an IP address automatically. By default the XRT-401F's DHCP server is enabled so that you can obtain an IP address automatically.

Please make sure that the XRT-401F's DHCP server is the only DHCP server available on your LAN. If there is another DHCP on your network, then you'll need to switch one of Note the DHCP servers off.

Step1→ Configure your PC to obtain an IP address automatically

This section will show you how to configure your PC's so that it can obtain an IP address automatically for either Windows 98/Me, 2000 or later operating systems. For other operating systems (Macintosh, Sun, etc.), please follow the manufacturer's instructions. The following is a step-by-step illustration on how to configure your PC to obtain an IP address automatically for a) Windows Vista, b)Windows XP, c) Windows 2000

a) Configuring PC in Windows Vista

- 1. Go to Start / Control Panel / Network and Internet / Network and Sharing Center. Double-click on Network Connections.
- 2. Double-click Local Area Connection.

At the User name prompt, type "admin".

And the Password prompt, type "**admin**". You can change these later if you wish. Click "**OK**".

Chapter 2 Quick Setup

The Wizard section is designed to get you using XRT-401F as quick as possible. In the Wizard, you are required to fill in only the information necessary to access the Internet. Once you click on the **Wizard** in the web page, you should see the screen below.

Step 1) Host Settings

The Host Settings allows your router to set up Host name and Domain name, it also can set up its Time Zone and Daylight Saving Time, these will affect functions such as Log entries and Firewall settings.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status

Function Mo	de		RO	uter 💌						
				Nex	ĸt					

Parameter	Description
Host Name	This is optional. You can specify a Host name for XRT401F.
Time Zone	Select the time zone of the country where you currently are.
	The router will set its time based on your selection.
Daylight Savings	The XRT-401F can also take Daylight savings into account. If you wish
	to use this function, you must select the enable box to enable your
	daylight saving configuration.
Function Mode	By default, XRT-401F is set as Router mode.
	If set to Bridge mode will turn the Router into 5-port Ethernt Switch
	where WAN port comes to Port # 5.

In this setup wizard, we set it as Router mode
--

Click on **NEXT** to proceed to the next page (step 2) WAN Settings.

Step 2) WAN Settings

In this section you have to select one of these types of connections that you will be using to connect your XRT-401F's WAN port to your ISP (see screen below).

~	Different ICD's require different methods of connecting to the Internet places check
Æ	Different ISP's require different methods of connecting to the internet, please check
Note	with your ISP as to the type of connection it requires.

Quick S	Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status

0	Russia PP	TP(Dual Acc	cess)								
				В	ack	Next	1				

Parameter	Description
Dynamic IP	Your ISP will automatically give you an IP address.
Static IP	Your ISP has given you an IP address already
PPPoE	Your ISP requires you to use a Point-to-Point Protocol over Ethernet (PPPoE) connection.
РРТР	Your ISP requires you to use a Point-to-Point Tunneling Protocol (PPTP) connection.
L2TP	Layer 2 Tunneling Protocol is a common connection method used in xDSL connections.
Dual Acces	This mode only active for Russia ISP that support dual layer Access to the Internet.

Click on one of the WAN types and then proceed to the manual's relevant sub-section (**2.1**, **2.2**, **2.3**, **2.4 or 2.5**). Click on **Back** to return to the previous screen.

2.1 Dynamic IP

Choose Dynamic IP if your ISP will automatically give you an IP address. Some ISP's may also require that you fill in additional information such as MAC address (see screen below).

ø	The MAC address section is <i>optional</i> and you can skip this section if your ISP
Note	does not require these settings for you to connect to the Internet.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Wizard										
DHCP Mod MAC Cloning Clone MAC:	DHCP Mode MAC Cloning Clone MAC: 00:00:00:00:00:00 Clone MAC									Help HELP See manual for detail.

My IP Address	This is the IP address that your ISP has given you to establish a
	PPTP connection.
My Subnet Mask	Enter the Subnet Mask provided by your ISP.
	(e.g. 255.255.255.0)
Gateway Address	This is the ISP's IP address gateway.
MTU	This is optional. You can specify the maximum size of your
	transmission packet to the Internet. Leave it as it is if you do not wish
	to set a maximum packet size. (The default setting is 1460)
Maximum Idle Time	You can specify an idle time threshold (seconds) for the WAN port.
	This means if no packets have been sent (no one using the Internet)
	during this specified period, the router will automatically disconnect
	the connection with your ISP. (The default settings is 300 seconds)

2.5 L2TP

Select L2TP if your ISP requires the L2TP protocol to connect you to the Internet. Your ISP should provide all the information required in this section.

Quick Set	up Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Wizard										
L2TP	Mode									Help
L2TP A	ccount		l2tp							HELP
L2TP P	assword		•••	•••						See manual for detail.

Subnet	Mask		255	.255.255	.0					
Gatewa	у		0.0.	0.0						
MTU (5	46-1460)		146	0						
Maximu	ım Idle Time (60-3	3600)	300	seco	nds (0: No tin	neout)				
			Ba	ack	Next					

Parameter	Description
L2TP Account	Enter the L2TP Account provided by your ISP for the PPTP
	connection.
L2TP Password	Enter the Password provided by your ISP for the L2TP connection.
Retype Password	Re-enter the Password for confirmation.
Service IP Address	Specify L2TP Server IP address that you want to connect to.
My IP Address	This is the IP address that your ISP has given you to establish a
	L2TP connection.
My Subnet Mask	Enter the Subnet Mask provided by your ISP. (e.g. 255.255.255.0)
Gateway Address	This is the ISP's IP address gateway.
MTU	This is optional. You can specify the maximum size of your
	transmission packet to the Internet. Leave it as it is if you do not wish
	to set a maximum packet size. (Default setting is 1460)
Maximum Idle Time	You can specify an idle time threshold (seconds) for the WAN port.
	This means if no packets have been sent (no one using the Internet)
	during this specified period, the router will automatically disconnect
	the connection with your ISP. (The default settings is 300 seconds)

Step 3) DNS

A Domain Name System (DNS) server is like an index of IP addresses and Web addresses. If you type a Web address into your browser, such as www.router.com, a DNS server will find that name in its index and the matching IP address. Most ISPs provide a DNS server for speed and convenience. If your Service Provider connects you to the Internet with dynamic IP settings, it is likely that the DNS server IP address is provided automatically. However, if there is a DNS server that you would rather use, you need to specify the IP address of that DNS server here.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Wizard										
DNS Serve	er ———									Неір
Static DNS S	Server		✓ E	Enabled				UELD		
Primary DNS	Primary DNS							See manual for detail.		
Secondary I	Secondary DNS 61.64.127.2									
			B	ack	Finish					

Parameter	Description
Static DNS Server	Select "Enabled" to allow configuring DNS manually.
Primary DNS Address	This is the ISP's DNS server IP address that they gave you; or you can specify your own preferred DNS server IP address
Secondary DNS Address	This is optional. You can enter another DNS server's IP address as a backup. The secondary DNS will be used if the above DNS fail.

Click on **<Finish>** when you have finished the configuration above.

Now! You have completed the connection configuration. You can start using the router now.

Chapter 3 Advance Features

If you have already configured the Wizard, you do NOT need to configure anything for you to start using the Internet.

Advance features that allow you to configure the router to meet your network's needs such as:

Firewall setup, Port Mapping, DMZ, Virtual Servers, QoS, and VLAN option.

Below is a general description of what advance functions are available for this broadband router.

Parameter	Description
3.1 Admin	This section allows you to set XRT-401F's system settings, password and Remote Management Administrator, it also allows you to check system status and log, and provide you the configuration tools.
3.2 WAN	This section allows you to select the connection method in order to establish a connection with your ISP (same as the Wizard section)
3.3 LAN	You can specify the LAN segment's IP address, subnet Mask,
	enable/disable DHCP and select an IP range for your LAN, you also
	can check DHCP client list in here.
3 4 NAT	You can configure the Virtual Server, Special Applications, Port Mapping
	ALG and DMZ functions in this section. This allows you to specify what user/packet can pass your router's NAT.
3.5 Firewall	The Firewall section allows you to configure Firewall, Client Filtering, URL Filtering and MAC Control.
3.6 Routing	You can configure Static Routing in this section, and check the concurrent Routing Table.
3.7 QoS	You can assign the bandwidth for specific LAN / WAN port. Each LAN Port will follow the bandwidth you assigned.
3.8 Other	You can configure UPnP and DDNS service in this section.
3.9 Status	You can check system information in here, including system status and concurrent hardware information.

Select one of the above advance features selections and proceed to the manual's relevant subsection.

3.1 Admin

This section allows you to set XRT-401F's system settings, password and Remote Management Administrator, it also allows you to check system status and log, and provide you the configuration tools.

Parameter	Description
3.1.1 System Status	You can check system information in here, including
	system status and concurrent hardware information.
3.1.2 System Settings	This section Includes Host Name, Domain Name, Time
	Zone, Daylight Saving and NAT enable/disable.
3.1.3 Administrator	Allows you to set user name, password and the idle time
Settings	out, you can specify a Host IP address that can perform
	remote management functions.
3.1.4 Firmware Upgrade	This section allows you to upgrade the router's firmware
	and display the concurrent firmware version.
3.1.5 Configuration Tools	This section allows you to backup or restore the router's
	configuration. It also allows you to restart router or reset
	it to factory default setting.
3.1.6 System Log	This section shows the current system and security log
	of XRT-401F, you also can specify a syslog server to save the
	log remotely.

3.1.1 Management

The Management Settings function allows you to design user name, password and the idle time, it also can allow you to configure Remote Management function.

Q	uick Setup	Admin	WAN	LAN	NAT	Firewall	Rou	uting	QoS	Other	Status	
М	anagement	System Se	ettings	Firmware	vare Upgrade Co		Configuration T		Log Settings		Logout	
	— Login Acco	ount ——										Неір

	- Remote M	anagemen	t ——									
	Enabled											
	IP Address			0.0	.0.0							
	Port			808	80							

Parameter	Description								
	Password Settings								
User Name	To specify a login name, the default is admin.								
Current assword	Enter the current password for verification. Max. length is 12								
	characters.								
New Password	Type a new password in order to access the web-based								
	management website.								
Re-type Password Re-type the password for confirmation.									
Remote Management									
Enable	To enable Remote Management function.								
IP Address	This is the IP address of the host in the Internet that will have								
	management / configuration access to XRT-401F from a								
	remote site. If the IP Address is 0.0.0.0, this means anyone								
	can access the router's web console from a remote location								
Port	The port number of remote management web interface. For								
	example, port 8080 means, from the Internet, you are required								
	to use the URL: <u>http://XRT401's WAN IP:8080/</u> to have the								
	access / remote mangement to this Router.								

3.1.2 System Settings

The system screen allows you to specify a time zone, Host Name, Function mode, and enable or disable NAT function of XRT-401F.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Management	System S	ettings	Firmware	Upgrade	Configura	tion Tools	Log	Settings	Logout	
Time NTP Server (Time Zone Daylight Sav	(IP or Doma ving	in name)	(GN	1T+08:00) Enabled Fr) Hong Kong, om FEB 🗸	Perth, Singap	(Optior ore, Taipei B 🖌 2	nal)		Help Time Zone Select the time zone for your location.
Host Name			XRT	Г-401F						
Operating NAPT	Mode —		I	Enabled						
Function M	Mode ——		Ro	uter 🗸						
			0	К	Cancel					

Parameter	Description
Host Name	Optional. You can specify a Host name for XRT-401F.
Set Time Zone	Select the time zone of the country where you are currently
	are. The router will set its time based on your selection.
Daylight Saving	The XRT-401F can also take Daylight savings into
	account. If you wish to use this function, you must select
	the enable box to enable your daylight saving configuration.
Host Name	Optional. You can specify a Host name for XRT-401F.
NAPT	Select to enable or disable NAT / NAPT function.
Function Mode	The XRT-401F supports two mode for your application, select
	the Router mode to act as a Router / Gateway which provides
	the firewall function to protect your private network. To select
	the Bridge mode, the XRT-401F will act as a pure 5-Port
	Ethernet Switch.
	The default mode is Router.

3.1.3 Firmware Upgrade

This page allows you to upgrade the router's firmware.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Rout	ting	QoS	Other	Stat	us

Firmware version: 1.0 Browse Saved on the local harc of the computer. Click Click											ade e the levice using ure that the nt to use is al hard drive . Click on		
	OK Cancel of the computer. Click on Browse to search the local hard drive for the firmware to be used for the update.													

Parameter	Description
Firmware Upgrade	This tool allows you to upgrade XRT-401F's system firmware.
	To upgrade the firmware of your Broadband router, you need
	to download the firmware file to your local hard disk, and enter
	that file name and path in the appropriate field on this page.
	You can also use the Browse button to find the firmware file
	on your PC.

3.1.4 Configuration and Tool

The Configuration Tools screen allows you to save (**Backup**) the router's current configuration setting. Saving the configuration settings provides an added protection and convenience, if the problems occur with the router and you have to reset to factory default. When you save the configuration setting (**Backup**) you can re-load the saved configuration into the router through the **Restore** selection. If extreme problems occur, you can use the **Restore to Factory Defaults** selection, this will set all configurations to its original default settings (e.g. when you first purchased the router). You also can **Restart** the router's system if any problems exist.

iick Setup	Admin	WAN	LAN	NAT	Firewall	Routin	ng ()oS	Other	Status

Parameter	Description
Restore Factory Default	If extreme problems occur, you can use the Restore Factory
	Default selection, this will set all configurations to its original
	default settings (e.g. when you first purchased the Router).
Backup Settings	Backup the configuration settings provide an added protection
	and convenience, if the problems occur with the router and you
	have to reset to factory default.
Restore Settings	When you save the configuration setting (Backup) you can
	reload the saved configuration into the router through the
	Restore Settings selection.
Reboot	In the event that the system stops responding correctly or in
	some way stops functioning, you can perform a reset. Your
	settings will not be changed.

3.1.5 Log Setting

The Logs record various types of activity on XRT-401F. This data is useful for troubleshooting,but enabling all logs will generate a large amount of data and adversely affect performance. Since only a limited amount of log data can be stored in XRT-401F, log data can also be e-mailed to your PC or sent to a Syslog Server.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	rewall Routing		QoS	Other	Status

	By default, it is Disabled.		
Send Email to	Enter the mail address that your want to mail log to.		
SMTP Server	Enter the address or IP address of the SMTP (Simple Mail		
	Transport Protocol) Server you use for outgoing E-mail.		

3.2 WAN

Use the WAN Settings screen if you have already configured the Wizard section and you would like to change your Internet connection type. The WAN Settings screen allows you to specify the type of WAN port connect you want to establish with your ISP. The WAN settings offer the following selections for the router's WAN port, **Dynamic IP**, **Static IP Address, PPPoE**, **PPTP**, and **L2TP**.

lick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status

Parameter	Description		
3.2.1 Dynamic IP	Your ISP will automatically give you an IP address		
3.2.2 Static IP	Your ISP has given you an IP address already		
3.2.3 PPPoE	Your ISP requires PPPoE connection		
3.2.4 PPTP	Your ISP requires you to use a Point-to-Point Tunneling Protocol		
	(PPTP) connection.		
3.2.5 L2TP	Your ISP requires L2TP connection.		

3.2.1 Dynamic IP

Choose the Dynamic IP selection if your ISP will automatically give you an IP address. Some ISP's may also require that you fill in additional information such as MAC address (see chapter 2 "**Dynamic IP**" for more detail).

Request IP address	
MTU(576-1500)	1500
Static DNS Server	
Primary DNS	61.64.127.1
Secondary DNS	61.64.127.2 (Optional)
MAC Cloning	Enabled
MAC Address (XX:XX:XX:XX:XX:XX)	00:00:00:00:00 Clone MAC

Cancel

Parameter	Description	
MTU	This is optional. You can specify the maximum size of your	
	transmission packet to the Internet. Leave it as it is if you do not	
	wish to set a maximum packet size. (The default settings is	
	1500)	
Static DNS Server	Select "Enabled" to allow configuring DNS manually.	
Primary DNS Address	This is the ISP's DNS server IP address that they gave you; or	
	you can specify your own preferred DNS server IP address	
Secondary DNS	This is optional. You can enter another DNS server's IP address	
Address	as a backup. The secondary DNS will be used if the above DNS	
	fail.	
MAC Cloning	If you want to clone your PC's MAC address to XRT-401F, you	
	must enable it first.	
MAC Address	Your ISP may require a particular MAC address in order for you	
	to connect to the Internet. This MAC address is the PC's MAC	
	address that your ISP had originally connected your Internet	
	connection to. Type in this MAC address in this section or use	
	the Clone MAC Address button to replace the WAN MAC	
	address with the MAC address of that PC (you have to be using	

that PC for the Clone MAC Address button to work).

3.2.2 Static IP

Select Static IP address if your ISP has given you one or more IP address for you to use. Your ISP should provide all the information required in this section. (See chapter 2 "**Static IP**" for more detail)

WAN Static IP	
Static IP Address	
IP Address	61.62.27.185
Subnet Mask	255.255.255.0
Gateway IP	61.62.27.254
MTU (576-1500)	1500
Static DNS Server	V
Primary DNS	61.64.127.1
Secondary DNS	61.64.127.2 (Optional)
MAC Cloning	Enabled
MAC Address (XX:XX:XX:XX:XX:XX)	00:00:00:00:00:00 Clone MAC
More IP addresses	
Does ISP provide more IP addresses?	

Parameters	Description	
Static IP	Your ISP has given you an IP address already, and you must	
	type in the related IP address such as IP Address, Subnet	
	Mask and Gateway.	
Does ISP provide more	Select <yes> if your ISP provide more than one IP address.</yes>	
IP addresses?		
More IP address	Type the other IP address that ISP provide to you,	
	This IP address will be useful in DMZ function.	
	Max IP address allowed is 6 separated IP address.	

3.2.3 PPPoE (PPP over Ethernet)

Select PPPoE if your ISP requires the PPPoE protocol to connect you to the Internet. Your ISP should provide all the information required in this section. (See chapter 2 "PPPoE" for more detail)

PPPOE
Address Mode
IP Address
PPPOE Account
PPPOE Password
Please retype your password
Service Name
MTU (546-1492) 1492
Maximum Idle Time (60-3600) 300 seconds (0: No timeout)
Connection Mode keep-alive 🗸
Primary DNS 61.64.127.1
Secondary DNS 61.64.127.2 (Optional)
MAC Cloning
MAC Address (XX:XX:XX:XX:XX:XX) 00:00:00:00:00 Clone MAC

Parameter	Description						
PPPoE	Your ISP requires PPPoE connection, and you must type in the						
	User Name, Password that your ISP provide.						
MTU	This is optional. You can specify the maximum size of your						
	transmission packet to the Internet. Leave it as it is if you do not						
	wish to set a maximum packet size. (The default settings is						
	1492)						
Connection Mode	Select the desired option:						
	Keep-alive (maintain connection)						
	The connection will never be disconnected by this device. If						
	disconnected by your ISP, the connection will be re-established						
	immediately. (However, this does not ensure that your Internet						
	IP address will remain unchanged.)						
	Auto-Connect						
	An Internet connection is automatically made when required,						
	and disconnected when idle for the time period specified by the						
	"Maximum Idle Time (60~3600)".						
---------------------	---	--	--	--	--	--	--
	Manual-on						
	You must manually establish and terminate the connection.						
Static DNS Server	Select "Enabled" to allow configuring DNS manually.						
Primary DNS Address	This is the ISP's DNS server IP address that they gave you; or						
	you can specify your own preferred DNS server IP address						
Secondary DNS	This is optional. You can enter another DNS server's IP address						
Address	as a backup. The secondary DNS will be used if the above DNS						
	fail.						
MAC Cloning	If you want to clone your PC's MAC address to XRT-401F, you						
	must enable it first.						
MAC Address	Your ISP may require a particular MAC address in order for you						
	to connect to the Internet. This MAC address is the PC's MAC						
	address that your ISP had originally connected your Internet						
	connection to. Type in this MAC address in this section or use						
	the Clone MAC Address button to replace the WAN MAC						
	address with the MAC address of that PC (you have to be using						
	that PC for the Clone MAC Address button to work).						

3.2.4 PPTP

Select PPTP if your ISP requires the PPTP protocol to connect you to the Internet. Your ISP should provide all the information required in this section.

WAN PPTP

Retype Password	Re-enter the Password for confirmation.						
L2TP Server	gateway IP address or domain name here. If you do not have a						
	L2TP gateway then enter the ISP's Gateway IP address above						
	or domain name.						
MTU	This is optional. You can specify the maximum size of your						
	transmission packet to the Internet. Leave it as it is if you do not						
	wish to set a maximum packet size. (The default settings is						
	1460)						
Maximum Idle Time	You can specify an idle time threshold (seconds) for the WAN						
	port. This means if no packets have been sent (no one using the						
	Internet) during this specified period, the router will automatically						
	disconnect the connection with your ISP.						
Connection Mode	Select the desired option:						
	Keep-alive (maintain connection)						
	The connection will never be disconnected by this device. If						
	disconnected by your ISP, the connection will be reestablished						
	immediately. (However, this does not ensure that your Internet						
	IP address will remain unchanged.)						
	Auto-Connect						
	An Internet connection is automatically made when required,						
	and disconnected when idle for the time period specified by the						
	"Maximum Idle Time (60~3600)".						
	Manual-on						
	You must manually establish and terminate the connection.						

3.2.6 BigPond (Australia)

Select BigPond if your ISP requires the BigPond protocol to connect you to the Internet. Your ISP should provide all the information required in this section.

— BigPond —————	
BigPond Account	
BigPond Password	
Please retype your password	
BigPond Server (IP or Domain name)	
Request IP address	
MTU (576-1500)	1500

Static Client	
Host Name	This is optional, you can specify a host name for your static
	client.
IP Address	Fill in the IP address which you wish to be a static client.
MAC Address	Fill in the MAC address which you wish to be a static client.

3.3.3 VLAN Settings

By default, the VLAN setting is disabled, however, you can turn it on for purpose, or setup the port based priority base on the VLN setting here.

The default setting is that, All the ports, say port 1 to port 4 is bound to WAN interface.

And WAN interface is bound to port 5 of the Router (where now, it is physically with printing **WAN**) So, all the network traffic that is goint go Internet, all with going out through the WAN port. Unless VLAN is enabled yet the port's VLAN is being disabled.

And once turn it on, you can base on PVID to separate the LAN. For example as the figure below, port 1 is connected with IP Phone, port 2 is connected with Video device, and port 3, port 4 is normal data ports. You can just change the PVID of port #1 to 4, port #2 to 5. Then, port #1, #2, are being separated from port 3 and port 4.

At the same time, you can also set the priority for port #1 to **7**, port #2 to **4**, and then for port # 3, por # 4 to **0**, then, the Router will schedule the network packets base on the prirority for packet out from that dedicated LAN port.

--------	--------	---

Parameter	Default	Description
VLAN Enable	Disable	Enable will turn on the port based VLAN.
		[After enabled, the options will show up.]
Port VLAN Enable	Enabled	The port join to the WAN VLAN group. To disable will
		make the port isolated from the WAN.
PVID	1	The VLAN ID of the selected port.
		1 for LAN 1 -4
		2 for WAN at port 5
Priority	4	The priority of the selected port.
WAN	Disabled	By default, the check box only enabled for port #5.

	1.	Different VLAN will have different PVID. Those ports with the same PVID will still
		see each other.
	2.	WAN should use different VID to LAN VID.
<i>⊯</i> ≦ Nata	3.	Due to the Router is a single port WAN Router, ONLY ONE WAN check box is
Note		allowed. By default, it is set on port 5.
	4.	This Router support port based VLAN at Router mode, yet at Bridge mode there
		are two different VLAN types, port based and 802.1q tagged VLAN for choice

3.4 NAT

Network Address Translation (NAT) allows multiple users at your local site to access the Internet through a single Public IP Address or multiple Public IP Addresses. NAT provides Firewall protection from hacker attacks and has the flexibility to allow you to map Private IP Addresses to Public IP Addresses for key services such as Websites and FTP. To meet various field applications, XRT-401F NAT function can be disabled to as a regular router. If NAT is disabled, all LAN side workstations must have valid IP addresses for Internet access. If the router is usedfor routing application, not for Internet access, then the NAT function can be disabled.

Parameter	Description
3.4.1 Virtual Server	You can have different services (e.g. email, FTP, Web
	etc.) going to different service servers/clients in your LAN. The
	Virtual Server allows you to re-direct a particular service port
	number (from the Internet/WAN Port) to a particular LAN IP
	address and its service port number.
3.4.2 Port Triggering	Some applications require multiple connections, such as
	Internet games, video conferencing, Internet telephony
	and others. In this section you can configure the router
	to support these types of applications.
3.4.3 Port Mpping	You can have different services (e.g. email, FTP, Web
	etc.) going to different service servers/clients in your LAN. The
	Port Forwarding allows you to re-direct a particular range of
	service port numbers (from the Internet/WAN Ports) to a
	particular LAN IP address.
3.4.4 Passthrough	You can select special applications that need "Passthrough" to
	support here.
3.4.5 DMZ	The DMZ function allows you to re-direct all packets
	going to your WAN port IP address to a particular IP
	address in your LAN.

3.4.1 Virtual Server

Use the Virtual Server function when you want different servers/clients in your LAN to handle different service/Internet application type (e.g. Email, FTP, Web server etc.) from the Internet.Computers use numbers called port numbers to recognize a particular service/Internet application type. The Virtual Server allows you to re-direct a particular service port number (from the Internet/WAN Port) to a particular LAN private IP address and its service port number.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Virtual Server	Port Trigg	jering	Port Mapp	ing P	assthrough	DMZ				
- Settings -										Help
Enabled										Virtual Server

V	HTTP		192.3	168.0.2	8	80	tcp	80	3 100	network via the Internet, the router will forward those
										requests to the appropriate
										rL.
			0	К	Cancel					

Parameter	Description
Enable	To enable the rule of Virtual Server.
Private IP	This is the LAN client/host IP address that the Public Port
	number packet will be sent to.
	Note: You need to give your LAN PC clients a fixed/static IP
	address for Virtual Server to work properly.
Private Port	This is the port number (of the above Private IP host) that the
	below Public Port number will be changed to when the packet
	enters your LAN (to the LAN Server/Client IP)
Туре	Select the port number protocol type (TCP, UDP or both). If you
	are unsure, then leave it to the default both protocols.
Public Port	Enter the service (service/Internet application) port number from
	the Internet that will be re-directed to the above Private IP
	address host in your LAN
Comment	The description of this setting.

3.4.2 Port Triggering

Some applications require multiple connections, such as Internet games, video conferencing, Internet telephony and others. In this section you can configure the router to support multiple connections for these types of applications.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Virtual Server	Port Trigg	ering	Port Mappi	ng Pa	assthrough	DMZ				
Settings - Enabled Trigger Port Trigger Type Public Port Type Comment	e			Z TCP ▼ TCP ▼ Add	v					Help Port Triggering Alow you to do port forwarding without setting a fixed PC. By setting Port Triggering rules, you can allow inbound traffic to arrive at a specific LAN host, using ports different than those used for the outbound traffic. This is called port triggering since the outbound traffic triggere to
	Rules List	ing						0/10(using/i	max)	which ports inbound traffic is directed.
	Comment		1	Frigger Po	ort	Pub	lic Port	Act	ion	
			O	<	Cancel					

Parameter	Description
Enable	To enable the rule of Port Triggering.
Trigger Port	This is the out going (Outbound) range of port numbers for this
	particular application
Trigger Type	Select whether the outbound port protocol is "TCP", "UDP" or
	both.
Public Port	Enter the In-coming (Inbound) port or port range for this type of
	application (e.g. 2300-2400, 47624)
	Note: Individual port numbers are separated by a comma
	(e.g. 47624, 5775, 6541 etc.). To input a port range use a "dash"
	to separate the two port number range (e.g. 2300-2400)
Public Type	Select the Inbound port protocol type: "TCP", "UDP" or both
Comment	The description of this setting.

Example: Special Applications

If you need to run applications that require multiple connections, then specify the port (outbound) normally associated with that application in the "Trigger Port" field. Then select the protocol type (TCP or UDP) and enter the public ports associated with the trigger port to open them up for inbound traffic.

Example:

ID	Trigger Port	Trigger Type	Public Port	Public Type	Comment
1	28800	UDP	2300-2400,47624	TCP	MSN Game Zone
2	6112	UDP	6112	UDP	Battle.net

In the example above, when a user trigger's port 28800 (outbound) for MSN Game Zone then the router will allow incoming packets for ports 2300-2400 and 47624 to be directed to that user.

Ľ
Note

Only one LAN client can use a particular special application at a time.

3.4.3 Port Mapping

The Port Mapping allows you to re-direct a particular range of service port numbers (from the Internet/WAN Ports) to a particular LAN IP address. It helps you to host some servers behind the router NAT firewall.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status	
Virtual Server	Port Trigg	jering	Port Mappi	ng P	assthrough	DMZ				
- Settings -										Неір

Mapping Ports (port1, port2, port3- Type TCP Image: Comment port4) Add										Port Mapping Allow you to set up public services on your network, such as web servers, ftp servers, e-mail servers, or other specialized Internet applications. Specialized Internet applications are any applications that use
	Rules Lis Comment	ting	Ser	ver IP		Mappin	g Ports	0/10(using/i	max) tion	Internet access to perform functions such as videoconferencing or online gaming. When users send this type of request to your network via the Internet, the router will forward those requests to the appropriate PC.
			O	к	Cancel					

Parameter	Description
Enable	To enable the rule of Port Mapping
Comment	The description of this setting.
Server IP	This is the private IP of the server behind the NAT firewall.
	Note: You need to give your LAN PC clients a fixed/static IP
	address for Port Forwarding to work properly.
Туре	This is the protocol type to be forwarded. You can choose to
	forward "TCP" or "UDP" packets only or select "both" to forward
	both "TCP" and "UDP" packets.
Mapping Ports	The range of ports to be forward to the private IP.

3.4.4 Passthrough

You can select applications such as PPTP/IPSex/L2TP VPN, FTP and H323 Netmetting that need "Passthrough" to support. It can let these applications correctly pass though the NAT Router.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status

Parameter	Description
Enable	You can select to enable "Passthrough" of an application and
	then the router will let that application correctly pass though the
	NAT gateway.

3.4.5 DMZ

If you have a local client PC that cannot run an Internet application (e.g. Games) properly from behind the NAT firewall, then you can open the client up to unrestricted two-way Internet access by defining a DMZ Host. The DMZ function allows you to re-direct all packets going to your WAN port IP address to a particular IP address in your LAN. The difference between the virtual server and the DMZ function is that the virtual server re-directs a particular service/Internet application (e.g. FTP, websites) to a particular LAN client/server, whereas DMZ re-directs all packets (regardless of services) going to your WAN IP address to a particular LAN client/server.

3.5 Firewall

XRT-401F provides extensive firewall protection by restricting connection parameters, thus limiting the risk of hacker attack, and defending against a wide array of common Internet attacks.

Parameter	Description
3.5.1 Firewall Options	XRT-401F's firewall can block common hacker attacks and can
	log the attack activities.
3.5.2 Client Filtering	Client Filtering allows you to specify which hosts users can or
	cannot access to certain Internet applications by IP address.
3.5.3 URL Filtering	URL Filtering allow you to specify which URLs can not be
	accessed by users.
3.5.4 MAC Filtering	MAC Filtering allows you to specify which hosts users can or
	cannot access to Internet by MAC address.

3.5.1 Firewall Options

XRT-401F's firewall can block common hacker attacks, including Denial of Service, Ping of Death, Port Scan and Sync Flood. If Internet attacks occur the router can log the events.

	MAC address connects to Internet.						
Configure MAC Address	Fill in or "MAC Address" and "Comment" of the PC, or						
	select the MAC Address from "Action", and then click						
	"Add".						

3.6 Routing

This section allows you to configure XRT-401F's static route and check the current routing table. The routing is only for internal routing using, so you do not need to disable NAT function, and there are two ways to manage the device's routing information, it includes **RIP** and **Static**.

3.6.1 Routing Table

The routing table display the current routing information in system.

Quick Setup	Admin	WAN	LAN	NAT	Firewall	Routing	QoS	Other	Status			
Routing Table	Static Ro	uting	Dynamic R	Routing								
– Routing Ta	able List —									Help		
De	estination Ne	etwork IP		S	ubnet Mask		Gatew	ay IP		Routing Table

	61.62.2	7.0		255.255.255.0			61.62	.27.0		current routing information		
	192.168.0.0			255.255.255.0			192.168.0.0			in system.		
				Refr	esh							

Parameter	Description
Destination LAN IP	The IP address where packets will go to.
Subnet Mask	The subnet mask of the destination IP address.
Gateway	The gateway that the packets will pass by during
	transmission.

3.6.2 Static Routing

This page is used to configure the routing information. Here you can add / delete IP routes. A static route is a pre-determined pathway that network information must travel to reach a specific host or network. (For example: Destination Network IP: 192.168.100.1, Subnet Mask: 255.255.255.0, Gateway IP: 192.168.0.2)

Parameter	Description
Destination LAN IP, Subnet	Specify the destination LAN IP where the packets will be
Mask	routing to packets will be routing to.
Gateway	Specify the other gateway IP that will route the packets to
	the destination.
Add	Click "Add" to add this routing information.

3.6.3 Dynamic Routing

Dynamic Routing can be used to cache routes learned by routing protocols, thus allowing the automation of static routing maintenance. The router, using the RIP (Routing Information Protocol) protocol, determines the network packet's route based on the fewest number of hops between the source and the destination. In this case, you could automatically adjust to physical changes in the network layout.

	router to this remote node in its RIP broadcasts or RIP				
	Multicast. Select the Mode you want to use.				

3.7 QoS

By configuring the QoS, you can assign the bandwidth for specific LAN / WAN port. Each LAN Port will follow the bandwidth you assigned. The QoS can smooth your network usage for Triple-Play applications such as the VoIP, IPTV and Internet.

3.7.1 Port based

When enabled, you can key in the max / gurantee transmit bandwidth in Kbps, for example, if the WAN **upload** bandwidth is 2Mbps, then, key in 2048, and if the LAN 1 is a PC that want to limit the **PC receiving rate** below 1Mbps, then, key in 1024. That is, key in a number that nuber will be the maximum bandwidth that the Router will give to the connected devices. And keep it in 0 for un-limits at the transmit rate.

Note	optimal network packet transmission.

3.7.2 DSCP

The XRT-401F also support DSCP (Differentiated Services Code Point) that can help to recognize and provide the QoS features to the network packts.

When turned on, the Rotuer will look up the DS (Differentiated Services) field for packt priority.

It will help to forward the packest that contain the priority information accordingly. The DSCP value can be from 0 (lowest priority) to 63 (highest priority). The Router can base on the priority to put the packest into three Weighted Queue, where each queue can have its buffer level from 1 to 15.

3.8 Other

3.8.1 UPnP

With **UPnP** (**Universal Plug and Play**), all PCs in you Intranet will discover this router automatically. So you do not have to do any configuration for your PC and can access the Internet through this router easily.

UPnP allows automatic discovery and configuration of equipment attached to your LAN. UPnP is supported by Windows ME, XP, or later. It provides compatibility with networking equipment, software and peripherals of the over 400 vendors that cooperate in the Universal Plug and Play forum.

Parameter	Description		
Enable UPnP	After you enable the UPnP feature, all client systems that		
	support UPnP, like Windows XP can discover this router		
	automatically and access the Internet through this router		
	without any configuration.		
Advertise Time (60 ~ 1800)	When UPnP service is working, router will broadcast a		
	message to LAN that the specific port number has been		
	used in a period of time. The maximum timing is up to		
	1800 seconds.		

UPnP Table

The table display the current UPnP Port Mapping information in system.

Parameter	Description
Remote Host	It shows the IP address of the remote Host.
External Port	It shows the external port number
Internal Port, Internal Client	It shows the internal port number and clinet.

Protocol	It shows the protocol.
Description	It describes this setting.

3.8.2 DDNS

DDNS (Dynamic DNS) allows you to map the static domain name to a dynamic IP address. You must get an account, password and your static domain name from the DDNS service providers. DDNS provides you on the Internet with a method to tie their domain name to a computer or server. DDNS allows your domain name to follow your IP address automatically by having your DNS records changed when your IP address changes.

3.9.2 System Log

The Logs record various types of activity on XRT-401F. This data is useful for troubleshooting,but enabling all logs will generate a large amount of data and adversely affect performance. Since only a limited amount of log data can be stored in XRT-401F, log data can also be e-mailed to your PC or sent to a Syslog Server.

The Log displays events occurring within the router by time and date, and also view the description of the event. The user can use the **First Page**, **Prev Page**, **Next Page** and **Last Page** buttons to change the log page listed in the window. The user can click **Setting** to configure your log settings, click **Clear** to clear the log events and click **download** to download the log file on your local PC.

Glossary

Default Gateway (Router): Every non-router IP device needs to configure a default gateway's IP address. When the device sends out an IP packet, if the destination is not on the same network, the device has to send the packet to its default gateway, which will then send it out towards the destination.

DHCP: Dynamic Host Configuration Protocol. This protocol automatically gives every computer on your home network an IP address.

DNS Server IP Address: DNS stands for Domain Name System, which allows Internet servers to have a domain name (such as www.Broadbandrouter.com) and one or more IP addresses (such as 192.34.45.8). A DNS server keeps a database of Internet servers and their respective domain names and IP addresses, so that when a domain name is requested (as in typing "www.planet.com.tw" into your Internet browser), the user is sent to the proper IP address. The DNS server IP address used by the computers on your home network is the location of the DNS server your ISP has assigned to you.

DSL Modem: DSL stands for Digital Subscriber Line. A DSL modem uses your existing phone lines to transmit data at high speeds.

Ethernet: A standard for computer networks. Ethernet networks are connected by special cables and hubs, and move data around at up to 10/100 million bits per second (Mbps).

Idle Timeout: Idle Timeout is designed so that after there is no traffic to the Internet for a preconfigured amount of time, the connection will automatically be disconnected.

IP Address and Network (Subnet) Mask: IP stands for Internet Protocol. An IP address consists of a series of four numbers separated by periods, that identifies a single, unique Internet computer host in an IP network. Example: 192.168.0.1. It consists of 2 portions: the IP network address, and the host identifier.

A network mask is also a 32-bit binary pattern, and consists of consecutive leading 1's followed by consecutive trailing 0's, such as 1111111.11111111111111111111100000000. Therefore sometimes a network mask can also be described simply as "x" number of leading 1's. When both are represented side by side in their binary forms, all bits in the IP address that correspond to 1's in the network mask become part of the IP network address, and the remaining bits correspond to the host ID. For example, if the IP address for a device is, in its binary form,11011001.10110000. 10010000.00000111, and if its network mask is, 111111111111111111110000.00000000 It means the device's network address is 11011001.10110000.10010000.00000000, and its host ID is, 00000000.00000000.000000111. This is a convenient and efficient method for routers to route IP packets to their destination.

ISP Gateway Address: (see ISP for definition). The ISP Gateway Address is an IP address for the Internet router located at the ISP's office.

ISP: Internet Service Provider. An ISP is a business that provides connectivity to the Internet for individuals and other businesses or organizations.

LAN: Local Area Network. A LAN is a group of computers and devices connected together in a relatively small area (such as a house or an office). Your home network is considered a LAN.

MAC Address: MAC stands for Media Access Control. A MAC address is the hardware address of a device connected to a network. The MAC address is a unique identifier for a device with an Ethernet interface. It is comprised of two parts: 3 bytes of data that corresponds to the Manufacturer ID (unique for each manufacturer), plus 3 bytes that are often used as the product's serial number.

NAT: Network Address Translation. This process allows all of the computers on your home network to use one IP address. Using XRT-401F's NAT capability, you can access the Internet from any computer on your home network without having to purchase more IP addresses from your ISP.

Port: Network Clients (LAN PC) uses port numbers to distinguish one network application/protocol over another. Below is a list of common applications and protocol/port numbers:

Application	Protocol	Port Number
Telnet	TCP	23
FTP	TCP	21
SMTP	TCP	25
POP3	TCP	110
H.323	TCP	1720
SNMP	UCP	161
SNMP Trap	UDP	162
HTTP	TCP	80
PPTP	TCP	1723
PC Anywhere	TCP	5631
PC Anywhere	UDP	5632

PPPoE: Point-to-Point Protocol over Ethernet. Point-to-Point Protocol is a secure data transmission method originally created for dial-up connections; PPPoE is for Ethernet connections. PPPoE relies on two widely accepted standards, Ethernet and the Point-to-Point Protocol. It is a communications protocol for transmitting information over Ethernet between different manufacturers

Protocol: A protocol is a set of rules for interaction agreed upon between multiple parties so that when they interface with each other based on such a protocol, the interpretation of their behavior is well defined and can be made objectively, without confusion or misunderstanding.

Router: A router is an intelligent network device that forwards packets between different networks based on network layer address information such as IP addresses.

Subnet Mask: A subnet mask, which may be a part of the TCP/IP information provided by your ISP, is a set of four numbers (e.g. 255.255.255.0) configured like an IP address. It is used to create IP address numbers used only within a particular network (as opposed to valid IP address numbers recognized by the Internet, which must be assigned by InterNIC).

TCP/IP, UDP: Transmission Control Protocol/Internet Protocol (TCP/IP) and Unreliable Datagram Protocol (UDP). TCP/IP is the standard protocol for data transmission over the Internet. Both TCP and UDP are transport layer protocol. TCP performs proper error detection and error recovery, and thus is reliable. UDP on the other hand is not reliable. They both run on top of the IP (Internet Protocol), a network layer protocol.

WAN: Wide Area Network. A network that connects computers located in geographically separate areas (e.g. different buildings, cities, countries). The Internet is a wide area network.

Web-based management Graphical User Interface (GUI): Many devices support a graphicaluser interface that is based on the web browser. This means the user can use the familiar Netscape or Microsoft Internet Explorer to Control/configure or monitor the device being managed.
